Of the 26 reports on elementary schools by her Majesty's inspectors, which are included in this volume, two-thirds contain a decidedly favourable judgment of the working of the revised code, so far as relates to the change introduced by it into the mode of examination and payment. The less favourable judgments turn chiefly on observations of a tendency to neglect higher subjects of instruction, and to dispense with pupil-teachers.

Respecting the income of the training colleges, the committee observes:—"We cannot help noticing that out of an income (1864) of £121,241, to which the State contributed £96,166, for the support of the 89 training colleges inspected, only £41 18s. 10d. is returned as derived from collections in churches and chapels. If an annual sermon were preached in each church or chapel of the diocese, or religious communion, with which each college is connected, on behalf of its funds, these institutions would become better known to the public, and might obtain more general support."

WORKING MEN'S CLUB AND INSTITUTE UNION.

The annual meeting of this institution was held on Monday, 2nd inst., in the Lower-hall, Exeter-hall; Lord Brougham in the chair. The report, which was read by the secretary, the Rev. Henry Solly, stated that 41 new clubs and institutes had been established during the past year under the impulse and guidance of the union, which, added to the number previously established, made a total of 116 clubs formed by the union during about two years and a half of active operation. From a return which had been received from about half of the clubs in the kingdom, it appeared that they numbered 14,667 ordinary members and 958 hon. members—the average number of members to each club being 228 ordinary and about 13 hon. members. Therefore if the remaining 70 or 80 societies which had not sent in returns contained about the same number, there would be a total of about 30,000 ordinary and nearly 2,000 hon. members in the clubs and institutes of Great Britain. Throughout the country and in the metropolis new clubs were being organised, but in South London and Bethnal-green, where they were re-eminently needed, greater difficulty and delay in forming them had been experienced than in almost any part of the country, mainly owing to the want of resident local gentry. The financial statement showed the receipts, including balance of £92, and donations £1,125, to amount to £1,609, and the expenditure to £1,470, leaving a balance of £139 in hand. The meeting was addressed by Lord Lyttelton, Lord Ebury, Mr. Layard, L.P., Dr. Bowkett, Mr. Bainbridge, Mr. Vyse, Mr. Harriatt, and others, and resolutions were passed adopting the report, re-electing the officers, acknowledging the importance of the operations of the union, and appealing for increased and more regular public support.

At the conclusion of the business, Lord Brougham said that the object of this important movement was to give to the working man an opportunity of combining amusement with his work, and spending one or two of his spare hours the evening in a manner which, whilst harmless, would prove highly profitable to himself. A working man, by the establishment of these clubs, was relieved from the necessity, which in many cases was a most disagreeable one, of leaving company at his own home, where he could ill accommodate a friend for an hour, as he could now, without the slightest inconvenience, enjoy the conversation of his fellow workmen and the amusements which were there provided for him. A friend of his from Carlisle had stated

that the working men's club at that place had proved a failure, but he (the noble lord) had discovered that the failure was consequent upon the club taking simply the form of a reading room. A reading room was undoubtedly an excellent thing, but the other characteristics of a club must be joined with it to render it successful. It had been said that there was a slowness on the part of the working men to join the clubs, but that, he thought, must arise from the fact that they had not had their operations and advantages sufficiently explained. He was certain that if that were clearly and properly done, the working men would not be slow to take advantage of the suggestions offered to them. A great change had taken place during late years, beginning at Rochdale and extending over Lancashire and Yorkshire; in fact, over the greater part of the north of England—he meant the system of co-operation, which was now becoming such a great power in this country. The co-operative system was most important to the working man, inasmuch as it tended to better his position in every respect, and he had no reason to suppose that the working classes themselves would not look upon it in that light, and that the clubs and institutes which had been established would not be warmly supported by them.

A vote of thanks having been accorded to the noble lord, the proceedings terminated.

Manufactures.

SILK WORM DISEASE IN FRANCE.—An error occurred in the notice on this subject in the *Journal* of the 30th of June, page 542. In the report in the *Moniteur* the quantity of eggs or seed required annually in France was incorrectly given: the actual quantity required annually is thirty thousand kilogrammes, or thirty-three tons.

ANOTHER NEW KIND OF WRITING-INK.—M. Mathieu Plessey, of Paris, manufacturer of pyrogallic acid for photographic purposes, has invented a new ink, which is said to be composed of a mixture of the products of his factory with the colouring matter of dye woods. It is said to possess all the qualities of the best ink, and to be entirely free from their common faults, not liable to form deposits, or to become thick and mouldy, to flow with great freedom, and to dry on the paper almost instantaneously.

PUBLIC WORKSHOPS FOR ARTISANS.—At a recent weekly sitting of the St. Marylebone Vestry, an important discussion arose, on a motion by Dr. Richardson, to invite all the other metropolitan vestries to elect two members each, with their medical officer of health, to consider the desirability of taking steps for the erection of public workshops in the various parishes, for the accommodation of artisans, who at present worked in their own small and crowded houses and rooms, and as to the propriety of obtaining an Act for the establishment of such workshops, similar to the "Baths and Wash-houses Act."—Dr. Richardson said he had brought forward this subject on sanitary, moral, and social grounds. With respect to the first, he was prepared to prove that epidemics were frightfully increased, and even introduced, into families of the upper classes, through clothes being made in crowded rooms, where fever prevailed. Many poor men, overwhelmed with debt, were unable to provide proper places for their labour, and consequently could not do their work in a proper manner, whilst others had no conveniences for pursuing their avocations at all.—Mr. Filmer opposed the motion, on the ground that, though the proposal might be an excellent one, brought forward as a public institution, or started by a limited liability company, he really thought it was one quite beyond the province of a parochial board.—After some further discussion, the motion was negatived.

THE COLOGNE EXHIBITION.—The following is a list of prizes and distinctions awarded to British exhibitors:—To the Fowler's Steam Plough Company (Limited), the

first prize of £150, for the best steam plough, and £75 for the best traction engine; to Messrs. Mereweather and Sons, London, the first prize of £75, for the best steam fire engine; to Messrs. Shand and Mason, London, a gold medal for ditto; to Messrs. Clayton and Shuttleworth, Lincoln, a gold medal for steam engine and thrashing machine; to Messrs. Hornsby, of Grantham, gold medal for ditto; to Messrs. Ransomes and Sims, of Ipswich, gold medal for ditto; to Messrs. Garrett and Sons, Leicester-Saxmundham, gold medal for ditto; to Messrs. Smyth and Sons, Peasenhall, gold medal for drills; to Messrs. Russell and Sons, Wednesbury, gold medal for tubes. The jurors also award silver medals to the following firms:—Robey and Co., Lincoln, for threshing machine and engine; Bentall, of Heybridge, for chaff machines, &c.; Mr. Kent, London, for domestic contrivances; Mr. Nicholson, of Newark, for horse rake; Messrs. Furness, Ipswich, for steam engine, threshing machine, and mills; the Reading Iron Works, Reading, for steam engine, threshing machine, and horse works; Mr. Robert Boby, Bury St. Edmunds, for patent self-cleaning corn screens, and for patent double-action haymaking machine; Ruston and Proctor, Lincoln, for steam engine and threshing machine; Burgess and Key, London, for reaping machine; Messrs. Samuelson and Co., Banbury, for mowing machines; Woods and Cockedge, for bean mill. Bronze medals are awarded to Messrs. Webb and Sons, Stowmarket, for the best leather driving bands; to Powis and Co., London, for steam sawing machinery; to Barrett and Co., Thirsk, for reaper; to Kemp, Murray, and Co., Stirling, for reaper; Gwynn and Co., London, for centrifugal pumps. Honourable mention to Mr. Goodcher, Workop, for threshing machine beaters. This list, in which almost all the first and most important prizes awarded in the agricultural machine department are included, shows sufficiently that Great Britain still maintains her superiority over the rest of the world in this department.

Commerce.

CHEMISTS AND DRUGGISTS.—The following is the report of the select committee of the House of Commons to whom were referred the Chemists and Druggists Bill, and the Chemists and Druggists (No. 2.) Bill:—"Your committee have examined witnesses on the general questions raised by the provisions contained in the two bills committed to them, and have heard evidence in support of the Chemists and Druggists (No. 1) Bill. Your committee then passed the following resolutions:—1. That no compulsory examination or registration under the bills referred to the committee should be required of persons now carrying on the trade of chemists and druggists. 2. That the bill do provide that no other person shall, after a day to be fixed by the bill, sell certain dangerous drugs, to be scheduled in the bill, unless he shall be examined and registered. By the adoption of the second resolution as an amendment to a proposal that persons compounding medicines from the prescriptions of medical men should also be examined, your committee decided against the principal provision contained in the Chemists and druggists (No. 1) Bill, and they accordingly resolved to proceed with the Chemists and Druggists (No. 2.) Bill. After several clauses of the bill were passed, considerable difficulty arose in providing for the first formation of the council to which the duty of regulating the examination of chemists and druggists was to be intrusted; and your committee, considering the advanced period of the session, were compelled to abandon the expectation of any useful result from a further consideration of the bill. Having, therefore, disposed *pro forma*, of the remaining clauses, they came to the following resolution:—"That inasmuch as there appears to be little prospect of any satisfactory termination to the labours of the committee in the present session, it is desirable that the evidence, so far as it

has been already taken, and the proceedings of the committee, be reported to the house, accompanied by a recommendation that the government should, early in the new parliament, bring in a bill on the subject referred to the committee. Your committee have in conclusion to report that, in their opinion, it is not expedient to proceed further with either of the bills which have been committed to them."

Colonies.

RAILWAYS IN VICTORIA.—The expressed intention of the Government to lease the Victorian railways as soon as they should have received sufficient information home to enable them to see their way clearly, is the natural result of the expensive manner in which the material trunk lines have been executed. Similar extravagance seems to have prevailed in New South Wales. Instead of starting, as would appear reasonable, from the head of the river navigation, the only two lines at present in working order from Sydney to Newcastle, lie, for the greater part of the way, side by side with a navigable sideway, and the available money has been already nearly exhausted at the time they have run themselves to a stand still among the intricacies of the Blue Mountains. It is difficult to say what number of years may be requisite to carry the Goulburn and Penrith lines effectually across the highlands into the level of Riverina. The actual cost of the Great Southern Railway from Parramatta Junction to Picton, and estimated cost from Picton to Goulburn, are given at £1,397,799. The actual cost of the Great Western Railway from the Parramatta Junction to Penrith, and estimated cost from Penrith to Bathurst at £146,852; sums which are indeed at a reduced rate from those of Victoria, but which New South Wales has far less power of meeting. The case of Victoria is not so desperate, but it is more owing to the facilities of the terrain than any superior wisdom. If the pass through which the line reaches Sandhurst had presented the same natural difficulties as the tangled precipices beyond Picton and Menangle, the terminus would never now have rested on the Murray. As it is favoured by the fortunate depression in the dividing range, it has reached both Echuca and Ballarat, but at a cost of eight millions. Against £404,808 which is set down as interest for the loan, and £116,912 working expenses, collectively £521,720, the receipts for the year 1864 amounted to £480,332, showing a deficiency of £41,388. A colonial journal says:—"Experience has shown that Government railways are exposed to the same embarrassances which make the greater number of public undertakings far more expensive than private ones. Paid officials at fixed salaries will never work as efficiently and cheaply as individuals whose profit depends upon their success. They likewise offer an enormous field for political jobbery."

COTTON CULTIVATION IN QUEENSLAND.—It is now become a general belief that cotton will thrive best when grown on land which has been a few years under cultivation, and that it is not the best crop to put in new ground. One of the principal growers in this colony has left a considerable quantity of his last year's crop of 300 lb. in, to test the opinion generally expressed—that there is no need to sow every year, but so far he is not content with the result. He is of opinion that the time saved in planting is not equivalent to the great advantage of loosening and turning the soil, which is, of course, impossible when the plants are left in the ground. He has about fifty acres altogether under crop, and he hopes not to have less than a bale per acre. This is the first season that the larger sum of £10 per bale premium given by Government, but is to be hoped that this will be extended another season or two. The Manchester Queensland Cotton Company has cleared 344 acres of

high 121 acres are under New Orleans cotton, which looks well and promises to yield a good crop. The area under Sea Island consists of 33 acres, of which 15 are lands of last year, which have been pruned. These are sowed with bolls, and the quality is fully equal to that of last year at 4s. 6d. per lb. Three bales have already been picked, and it is estimated that the yield will average one bale per acre. The total area under cultivation is 154 acres, not quite so many as last year, but promising much more satisfactory results.

FISH IN VICTORIA.—The extent of the Victoria fishing ground is immense. In Port Philip Bay there is an area of over 700 square miles, with a coast line of about 130 fms. well supplied with fish; and in Western Port Bay out 300 square miles, one immense fishing ground, and all more plentifully supplied with better fish, and with coast line of 120 miles, including French and Phillip lands. Both bays are landlocked, and in every way favourable for fishing. The following are the descriptions of fish found in these bays. Schnapper, from 2 lbs. to 10 lbs., even 30 lbs.; rock cod, flat head, garfish, whiting, hake, mullet, gurnet, ling, perch, mackerel, butter fish, 10 lbs. to 20 lbs.; salmon trout, white salmon, bream, hake, flounders, and kingfish, also crayfish, shrimps, and mussels. There is one immense bank, extending south of east from the eastern entrance of Western Port, running with schnapper, rock cod, and other fine fish, it would of itself, even as far as now known, supply a large fishery. It has been ascertained that the banks trending to the eastward of King's Island, Rabbit Island, and Dorner Islet, besides butterfly, jewfish, and others, abound in flounders of large size and of the finest quality; and as the straits average less than 45 fathoms, and with much sand and shell bottom, most favourable for trawling, it is only requisite to have proper boats to use as ample a supply in winter as in summer.

MINES IN SOUTH AUSTRALIA.—There are now seven working mines on the peninsula, nearly all of which may be said to be paying mines, viz., Moonta, Wallaroo, New Cornwall, Yelta, Karkarilla, Kurilla, and South Wallaroo. The Moonta is probably the richest mine in the world, standing almost unrivalled for the richness of its mineral deposits. It is stated that the monthly produce there varies from 1,500 to 1,800 tons, worth at least 20 per cent. of pure copper. Very rich black ore is also being raised from the mine, besides sulphides and carbonates of various per centages. Next in importance is the Wallaroo mine, near Kadina, the quantity of ore raised from which nearly equals that of the Moonta, but the quality is inferior by 5 to 7 per cent. A large accession of strength has lately been received at this mine, sixty men, with their families, having just arrived in England.

SHEEP-FARMING IN VICTORIA.—Opinions are said to be changing as to the feeding capabilities of this country, and principally because of the fencing and subdividing of many sheep-runs, as well as of the necessity for keeping small flocks by farmers on limited spaces of ground. Here the old system of shepherding on the open pasture still followed there has been little or no improvement in this respect, but even by fencing alone the feeding capabilities of any tract of land are vastly increased. Men driven to-and-fro in large numbers, the sheep trample under foot and destroy as much as they eat, and much of the food they do get is wasted in the exertion of walking much further than they otherwise would, and, as grass is scarce, in racing a-head for the little that is picked up, and when allowed to follow their own inclination, as they are within fences, there is no hurry or tiring, no more travelling than is actually necessary, and little or no grass is so trampled upon as to be wasted. The loss from driving alone, even by the most careful shepherds, is considerable, and should not be overlooked in calculating the advantages of fencing-in a run. Thus, estimating these the saving of wages is but a trifling benefit gained in comparison with the saving of grass and

the consequent increase in the number of sheep the same extent of ground will keep. The grazing capabilities of many of the runs have been doubled by fencing alone; land which before only kept one sheep to two acres, is now a sheep per acre, and keeping them in better condition throughout the year, while on limited portions of the best land, well subdivided, even two or three sheep to the acre are kept all the year round, or nearly so, and this on the natural grasses, improved only by the long feeding down and manuring of the sheep kept thereon. The gradual introduction of English grasses and clover has helped materially, in places, towards this improvement, but these do not spread much except when the land has been broken up.

Obituary.

ANTOINETTE JOSEPH WIEZT, painter, sculptor, and writer, born at Dinant, in Belgium, in 1806, died at Brussels last week. He was a pupil of Van Brée, and won the grand prize of the Belgian Academy in 1832. He executed a large number of large historical works of importance, and wrote, amongst other things, "Memoirs of the Life of Rubens."

NILS ANDERSON. Professor of Painting in the Academy of Stockholm, died recently at the age of forty-six. He studied for some years under M. Couture, of Paris, and afterwards founded a school in Stockholm, which has produced many distinguished painters.

Publications Issued.

L'ASTRONOMIE AU XIX^{ME}. SIÈCLE. Par M. A. Boillot. 1 vol., 12mo. (Paris: Didier and Cie.) A carefully executed history of the progress of astronomical science from the earliest period to the present day, by a mathematical professor who is also scientific editor of the *Moniteur Universel*, and contained in a single volume of small size. The work is intended for general readers, contains all the principal facts relative to the subject which it treats, is clear of technicalities, is written in a lucid, pleasing style, and exhibits the utmost impartiality in treating of the labours and discoveries of the astronomers of foreign nations. In fact the English element is very prominent in M. Boillot's book: he not only does full justice to Newton, Flamsteed, Halley, Bradley, Captain Cook, the Herschels, Hind, Airy, Nasmyth, Lord Rosse, and other Englishmen, but the entire volume shows that M. Boillot is very conversant with both the literature and science of our own country. The first chapter contains a short sketch of the labours and notions of the old astrologers, which will be very welcome to the general reader. Of Newton, M. Boillot speaks with the greatest enthusiasm:—"The great Newton, the creative mind, the precise thinker, and fruitful genius, meditating on Kepler's law and on the special movements of the moon, was dissatisfied with the result with which the science of his day furnished him. He saw that the force then called *weight* or *heaviness* might well extend to the moon, and he verified the truth of his idea. His mind, stimulated by this first success, assumed increased activity, and finished by dissipating all the clouds that had obscured the view of the grandest scientific discovery that was ever made—the principle of universal attraction." The chapter which records the services that have been performed for astronomical science by the combined efforts of the Observatories of Paris and Greenwich, aided by the astronomers of other countries, during the last ten years, and the observations on the consequences of the spectral analysis, are full of interest.

ANNUAIRE DE L'ECONOMIE POLITIQUE ET DE LA STATISTIQUE. By Maurice Block. 1865. (Guillaumin and Cie, Paris.)—This modest annual, now in its twenty-

second year, contains a vast amount of information, well arranged and well printed, in a handy form, and at a moderate price. It is divided into four parts, the first treating of France in general, the second of Paris in particular, the third of Algeria and the colonies—a new feature, introduced for the first time this year—and the fourth of foreign states, besides supplementary matter. The wonderful changes which the city of Paris and the Department of the Seine have undergone during the last twelve or fifteen years, and which are still in progress, give a peculiar interest to that portion of the work which treats of the metropolis. We find the ordinary receipts of the municipality for 1864 set down at very nearly a hundred and twenty millions of francs, and estimated for the current year at rather over a hundred and thirty millions of francs. The principal items are the following:—Octroi duties, paid at the barriers of the city on articles of ordinary consumption such as food, wine, oil, fuel, &c., upwards of eighty-eight millions; market dues, nearly eight millions; water-works, five millions and a-half. In addition there are further ordinary, supplementary, and extraordinary receipts, making up the grand total revenue of the municipality to upwards of one hundred and fifty-five and a half millions. The estimates are made to balance, so that the same sum represents the expenditure. The population of the city was, in 1861, 1,696,141, and the annual increase since, about 7,500 per annum, making a total of rather less than a million and three-quarters for the current year. If we divide the gross total of the above estimate by the total number of the inhabitants of Paris, we find that the expenditure is equal to rather more than eighty francs, or full £3 11s. per head. In the year 1863, the total of all expenses—ordinary, extraordinary, and supplemental—amounted to very nearly two hundred and ten millions of francs, or, on an average, very nearly £5 per head. These figures are derived from the published reports of the Prefect of the Seine, and it must be remembered that they represent the municipal expenditure alone, exclusive of the general taxation of the empire. The ordinary expenditure of the current year is set down at equal to £3,365,845, the principal items being, in round numbers:—Annual interest on municipal debt, £537,150; expenses of the prefecture and twenty mairies, £124,000; collection of octroi dues, £310,000; National Guard, Gardes de Paris, &c., nearly £120,000; charitable institutions, £411,879; primary instruction, £178,924; survey and plan of Paris, £69,436; roads and quarries, £679,176; water and sewers, £103,288; promenades and plantations, £115,440; police, £495,673. The extraordinary and supplementary expenditure is estimated at equal to £2,837,756, of which sum £412,596 is devoted to further interest and charges on the city debt, and the greater portion of the remainder to the improvements and embellishments of the capital, the reconstruction of the abattoirs, and the completion of the roads and other works in those parts of the former *banlieues* which now form integral portions of the city. As regards the amount of indigence in Paris, the returns make a very satisfactory appearance. In 1832, it seems there was one person receiving public assistance to every 11.16 of the population; in 1838, it had fallen to one in 15.37; between that period and 1847 it had risen again to one in 13 or 14; in 1850, it had fallen to one in 16.88; and in 1861 it was only one in 18.47. The total number receiving relief in that year was 101,570, and the sum distributed was equal to £168,000, of which one-fourth was derived from testamentary and voluntary contributions. Deducting from this total the amount expended in medical assistance rendered at the homes of the poor, it appears that on an average each person relieved received about 27s., or three times as much as the average in the tenth year of the first republic. The number of houses demolished and constructed during the twelvemonth ending with September, 1864 in Paris, was as follows:—1,383 demolished, of which 271 were in consequence of municipal improvement, and 3,098 erected,

leaving a balance of 1,715 houses, or 15,676 sets of apartments, number corresponding to a population of about 45,000 persons. The total increase in the number of apartments created, by demolition and reconstruction, to September last is given at 629,421, by far the larger portion being in the new or outlying districts of the city, such as those of Popincourt, the Gobelins, the Observatory, Vaugirard, Passy, Batignolles, Montmartre, the Butte Chaumont and Menilmontant. The chapter relative to Algeria and the colonies informs us that the European population of Algeria, which only numbered 700 in 1830, had risen to 37,374 in 1841, and to 213,061 in 1863; in the year 1862 the French subjects numbered 118,804, and the natives of the European States 86,073; but the per centage of increase is in favour of the latter, although the actual increase is slightly on the side of the French immigration. The French army in Algeria amounted in 1861 to 63,786, and the civilians employed, and are included in the general population given above, to 11,151, or together equal to about 40 per cent. of the total population. At the same period the native population was about five millions and a-half. As regards commerce the returns are not encouraging, for the total of imports and exports had fallen from 167 millions of francs in 1858 to less than 139½ millions in 1862. There was, however, an increase of about 40 per cent. in the exports of 1863, with a slight diminution of the imports. A comparative table of the mercantile marine of the world will be interesting to English readers. It appears that while in Belgium there exists but one ton of shipping for every 162 inhabitants, the ratio in France is 1 in 38; in Spain, 1 in 18.4; in Sweden, 1 in 9.9; in the United States, 1 in 6.1; in England and in Holland, 1 in 5.5; in Greece, 1 in 4; in Norway, 1 in 2.1; in Hamburg and the Free Cities, 1 in 0.9; and in Bremen, 1 in 0.6.

Forthcoming Publications.

ART FOLIAGE. By James K. Colling, F.R.I.B.A. The work will be divided into three parts, and consist of:—1. An analysis of form, being a selection from the best and most useful geometrical ornaments, which have been used for decoration in the various periods of art, and in different parts of the globe, with an analytical description and comparison of their various combinations. 2. A series of studies from natural foliage—in the branch, the bud, the leaf, the flower, and the fruit—accompanied by letter-press description and wood-cuts. 3. A series of original designs for foliated enrichments suited to the various branches of the ornamental arts, including stone and wood carving, painted decoration, inlaying in wood, stone, and marble, wall papers, metal work, &c., accompanied by a detailed description of each plate, explaining the sources from which the designs have been derived, and an endeavour to elucidate the principles which should guide the artist in the signing from nature; the primary object being to show how natural form was idealised by ancient and mediæval artists, and in what manner the same sources may be again appealed to, to gain new beauty and fresh inspiration.

Notes.

THE PHILADELPHIA SKETCH CLUB offer a prize of \$200 dollars for the finest work of art illustrative of the great American rebellion. Contributors must be, at the date that they send in their contributions, residents of the United States.

FRENCH ACADEMY OF INSCRIPTIONS AND BELLES-LETTRES.—The numismatic prize of this Academy, founded by M. Allier de Hauteroche, has been awarded to Mr. John Evans, for his work, published last year in London, on the coins of the Ancient Britons.

UNIVERSAL EXHIBITION OF 1867.—The *minimum* of guarantee having been subscribed for, the Imperial Commission has added nineteen members to its representatives of the guarantors provided for in the final decree. The list includes several names well known in the financial and industrial world, as, for instance, E. Perèire, P. Talbot, the Duc d'Albúfera, James de Rothschild, Sallandrouze de Lamornaix, and Halphen.

PRIZE IN VOLTAIC ELECTRICITY.—The French Government has just announced the renewal of the grand prize of 50,000 francs to be given, in five years' time, to the author of a discovery which shall render the voltaic electrically applicable as a source of heat, as a motive power for lighting, or otherwise, in chemistry, mechanics, or the arts. This prize was awarded, in September last, to the late Professor Ohm, for the well-known apparatus which bears his name. In case no invention deemed worthy of the prize should be brought forward within the time specified, the period may be prolonged for another five years. The prize is, we believe, open to all the world, as it is not so stated.

GREAT DRAINAGE WORKS.—In consequence of the disastrous inundations which occurred in 1856, when the great basins of France were inundated, a commission of inquiry and surveys were made, and in 1858 a law was passed for the carrying out such works as should be necessary in the towns which had suffered most against future inundations. Works have been executed with that view in several towns, at an outlay of twenty-two millions of francs (£350,000). As regards the great valleys, the Government appointed an inspector-general for the Seine, the Loire, the Rhone, and the Garonne, the result of all the surveys and inquiries that have been made was made known to the Corps Legislatif by the late Minister of Agriculture, in the following words:—"Are you aware, gentlemen, what it would cost to reduce the level of the waters in these valleys two or three feet, during great inundations? In the valley of the Loire it would require eighty-five millions of francs (thirteen millions sterling), and the same for that of the Rhone. We have not dared to undertake such an enterprise, for the country to make such sacrifices in order to avoid a misfortune that only occurs two or three times in a century." The valley of the Rhone was inundated in the years 1840, 1841, and 1856, and that of the Loire in 1846 and 1856. The opinion of those who have been consulted on the subject is that such inundations cannot be prevented by any changes that may be made in the distribution of timber in the localities, but that the facts observed during eight or ten centuries prove that they are the result of a concurrence of a certain number of atmospheric circumstances which fortunately happen very seldom. Another conviction forced upon the minds of the engineers is that the plans proposed are of no great efficiency, and upon this head a report was made of the results of all the examinations that have taken place under the general council of engineers in charge of the roads and bridges of the empire.

RAILWAYS.—A very important problem, that of the construction of railroads connecting small places with each other, and with the main lines, is being resolved in France. The initiative belongs to the department of the Interior, whose Conseil-Général, in 1858, came to the decision that it was desirable to create a second system of roads uniting the principal places in each commune, and to offer these to companies or local speculators for the formation of railroads. There was, however, considerable opposition, one party objecting that the funds of the commune, as it would be called in England, could not be applied to the formation of roads to be converted into railroads, and another, that local railroads were the dreams of theorists. Last year, however, the Government obtained the support of the Ministers of State and Agriculture, M. Rouher and M. Behic, who supported

the proposal in the Conseils-Généraux of the Puy-de-Dôme and of the Bouches-du-Rhône. The prefect of the Bas-Rhin had, in the meantime, pushed forward his scheme, and in 1859 he obtained the sanction of the departmental authorities. He then opened up correspondence with the Great Eastern Railway of France, but the negotiations ended in nothing, and it was determined to form local companies for the purpose, and in 1861 a supplementary tax of twenty-six centimes (about a shilling in the pound), extending from 1861 to 1871, was made for the special purpose, and the work was commenced. On the 25th September, 1864, the first of these departmental lines, about forty-seven miles in length, was opened for traffic. The government recognised the importance of the new movement, the ministers of the interior and of commerce determined on framing a special law upon the subject, and a commission issued from the office of the latter minister to collect full information upon the subject. The example of the Bas-Rhin was soon imitated by its neighbour, the department of Haut-Rhin, in which a line from Haguenau to Niederbroun was opened on the 18th, and another from Sainte Marie-aux-Mines to Schelestadt on the 29th of December last. The department of Sarthe has voted the means for carrying out three such local lines. Ain, which is very badly off as regards railway communication, is now engaged on the question; and several other departments have adopted the idea and are now occupied with its realisation. In that of the Seine-inférieure surveys are being made for a line to connect St. Valéry-en-Caux with the Rouen and Havre railway, and which is intended to form part of a complete system which will unite the whole of the small places on that coast with the trunk line in question. The results, in a financial point of view, can only be guessed at by the short experience of the line in the Bas-Rhin; this road was opened for passengers on the 25th of September, and for heavy traffic, in part, on the 24th October, and completely on the 29th December last, when the weather was very bad, and the conditions consequently disadvantageous. The total receipts, from the 27th September to the 31st December, were equal to £2,939, or, on an average, of £320 for little more than $\frac{1}{16}$ of a mile. The profit resulting is given at 2,000 francs per kilomètre, or about £130 per English mile. The nature of the traffic is a very important question. The Barr line has fifteen stations, that is to say, one for each commune; this was used by 70,000 persons, who paid a total of 60,293 francs, or, on an average, 86 centimes per passenger. This is tolerably conclusive evidence that the traffic of the line was eminently local and independent of the general railway traffic of the country. There is another proof in the fact that the total of arrivals and departures at the station of Strasbourg, on the main line, during the same period, was only 47,768, which leaves 22,232 for the purely local circulation, without taking into account those which may have travelled for local purposes between the chief town and intermediate stations on the trunk line. It is not intended that great speed should be attained on these local lines, and therefore the question of curves and gradients becomes of smaller importance. In the Haute-Marne the minimum radius is fixed at 250 mètres; in the Indre it has been set at 300. The inclines adopted in the Haute-Marne vary from 0.02 to 0.018 per mètre. Lastly, some of the local lines will be worked by horses, while the engines and carriages employed on the others are of a smaller and less costly kind than those used on the main lines. In the Bas-Rhin the expense of the new roads has been 45,000 francs per kilomètre, while it has cost the Great Eastern Company, which has become the *concessionaire* of the line, 60,000 francs per kilomètre to convert the new roads into railroads and provide machinery and material. Thus the total cost of these local lines may be taken roughly at an average of 115,000 francs per kilomètre, while the Paris and Orleans cost 368,000 francs, and the Rouen line 404,000 francs per kilomètre. It is not easy to exaggerate the results which may arise

from the complete carrying out of this system of rural railways, and any fact connected with it is of importance.

Patents.

From Commissioners of Patents Journal, June 30th.

GRANTS OF PROVISIONAL PROTECTION.

- Artificial fuel—1600—C. J. Collins.
Bottles and stoppers—1670—H. B. Fox.

Boilers, multitubular—1614—H. Ormson.
Buildings, partitions, roofs, &c., of—1606—J. J. Badner.
Carriages, break for—1604—J. Griffiths.
Carriage windows, arrangements for opening and shutting—1613—S. Courthauld and C. W. Atkinson.
Coal, &c., machinery for compressing—1606—H. G. Fairbairn.
Collars and cuffs, machine for curling or curving—1590—J. Spence.
Cotton-spinning—1674—J. de Hemptinne.
Doors and windows, &c., fastenings for—1678—G. E. Mack and W. H. Howes.
Doors and windows, apparatus for maintaining in position when open and for securing when shut—1581—A. H. Gilmore.
Fibrous materials, apparatus for printing—1590—J. Henderson.
Fibrous substances, preparing and spinning—1665—S. Bell, Broughton, and R. Hunter.
Furnaces—1690—R. A. Brooman.
Fire-arms, breech-loading—1562—J. R. Cooper.
Frames for looking-glasses—1664—H. Hunt and R. Hunter.
Fuses for shells for ordnance—1606—G. Haseltine.
Gas, purification of—1591—J. Thomas.
Hammers, steam—1607—B. and S. Massey.
Iron and steel manufacture, apparatus used in—1606—H. Allen.
Iron ships, sheathing—1612—W. R. Mulley.
Kilns for firing porcelain—1682—R. A. Brooman.
Leather and fabrics, ornamenting—1389—W. Clark.
Locomotive engines, &c.—1601—J. H. Johnson.
Metals, machinery for cutting—1571—W. W. Hulse.
Paper manufacture—1602—T. Routledge.
Paper manufacture—1606—J. A. Millington and A. Allatt.
Paraffin, purifying—1606—G. E. Poynter.
Phthalic acid and chloroxynaphthalic acid—1606—F. A. Leavelle and J. Castheiaz.

Railway signals—1603—E. S. Horridge.
Rocks, cutting and excavating—1567—G. Haseltine.
Safety valves—1576—C. Vernon and W. Hodgkins.
Sewing machines—1606—J. Draper.
Sewing machines—1684—J. Glazebrook and M. N. and B. R. M.
Sewing machines—1592—J. Hayes.
Sewing machines—1611—G. E. and J. Keats.
Ships, sheathing the bottoms of—1567—B. S. Cohen.
Splints for fractures—1607—C. A. Hemingway.
Steering apparatus for ships and vessels—1677—W. H. Harkiss.
Ships cables, apparatus for stopping and easing—1608—C. A. Harkiss.
Tea, drying and curing—1604—A. Robinson.
Traps for rabbit-catching—1375—R. T. Birt.
Wickets for the game of cricket—1478—W. H. Stanley.
Wood, impregnating with various substances—1673—W. E. 604.

INVENTIONS WITH COMPLETE SPECIFICATION FILED.

Nails for horse-shoes—1693—P. A. le Comte de Fontaine.
Sewing machines—1678—G. Haseltine.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following is a continuation of the information relating to Musical Education on the continent, collected by this Committee:—

NATIONAL CONSERVATOIRE OF MUSIC AND ELOCUTION, FRANCE.

The following are the complete regulations now in force:—

In the name of the French people.

The Minister of the Interior,—Having regard to the decision of the 14th March, 1848, appointing a special commission for the purpose of seeking modifications to be introduced into the management and the teaching of the Conservatoire; having regard to the report made by this commission; * having regard to the report made by the Government commissioner on the *théâtres lyriques* of the Conservatoire; on the advice of the commission, decrees as follows:—

DIVISION I.

CHAPTER I.

ARTICLE I.—The national conservatoire of music and elocution is devoted to the gratuitous teaching of vocal and instrumental music and to dramatic declamation.

ARTICLE II.—This teaching is divided into eight sections:—

1. Study of the Solfeggio oral harmony, the study of keyed instruments, the learning of parts, which form the elementary instruction.
2. Singing.
3. Lyric elocution.
4. The piano and harp.
5. Stringed instruments.
6. Wind instruments.
7. Harmony, the organ, and composition.
8. Dramatic elocution.

ARTICLE III.—An elementary and popular course of singing of a higher degree than that taught in the communal schools is open at the Conservatoire for adult males.

ARTICLE IV.—A library composed of musical works, and of books relative to the musical and dramatic arts, forms part of the establishment.

* The members of this commission were:—Messrs. Auber, Halévy, Couperin, Ponsseur, Levasseur, Benoist, Girard, Melfred, Marcot, Bazin, Samson, Provost, Louis Perrot, Rety.

DIVISION II.

CHAPTER II.—DIRECTION AND ADMINISTRATION.

ARTICLE V.—The Conservatoire is placed under the authority of a director, who directs all the works, and presides over all committees, in which he has the casting vote.

ARTICLE VI.—The director is appointed by the Minister of the Interior. In case of illness or absence, the minister designates the person who is to fulfil his duties.

ARTICLE VII.—The administration is composed besides of:—

1. A secretary attached to the direction.
2. An accountant entrusted with the receipt of money.
3. A superintendent of classes.
4. A head librarian.
5. An overseer of the library.

ARTICLE VIII.—All these functionaries, as well as those employed in the establishment, are appointed by the Minister of the Interior. Their salaries and their advancement are regulated in the following manner:—The commencing salary of the secretary is £80 (2,000 fr.); that of the accountable agent is £60 (1,500 fr.); that of the head librarian is £100 (2,500 fr.); that of the superintendent of classes, and of the overseer of the library, £48 (1,200 fr.); with increase of £12 (300 fr.) every five years, till a maximum is attained of £160 (4,000 fr.) for the secretary; £120 (3,000 fr.) for the accountable agent; £96 (2,400 fr.) for the superintendent of classes and the overseer of the library. The salary of the head librarian may be raised to £120 (3,000 fr.) after five years of service. The salaries of the servants in the establishment are from £16 to £32 the maximum. They are increased by the Minister of the Interior at the request of the Director.

DIVISION III.

CHAPTER III.—THE INSTRUCTION.

SECTION I.—ELEMENTARY INSTRUCTION.

§ 1.—Solfeggio.

ARTICLE IX.—There are two kinds of Solfeggio teaching, namely, collective and individual.

ARTICLE X.—There are two classes of collective Solfeggio teaching. The number of pupils is unlimited. One of the classes is conducted by a professor; the other by an assistant-professor.

ARTICLE XI.—There are twelve classes of individual Solfeggio teaching. None of these classes may consist of more than twelve pupils. They are conducted by two professors, four assistant professors, and six teachers.

ARTICLE XII.—The director may appoint the teachers for any supplementary classes of Solfeggio that may be considered necessary.

ARTICLE XIII.—The duration of the course of collective Solfeggio is one year; that of individual Solfeggio is two years, except in certain cases, of which the committee of teaching is to be judge.

§ 2.—*Oral Harmony.*

ARTICLE XIV.—There is a class of oral harmony conducted by a professor. The number of pupils is unlimited.

§ 3.—*Study of Keyed Instruments.*

ARTICLE XV.—There are five classes for the study of keyed instruments. Two for male pupils, conducted by an assistant professor and a teacher; three for female pupils, conducted by an assistant professor and two teachers.

ARTICLE XVI.—These classes, to which at the most only eight pupils and two listeners (*auditeurs*) are admitted, are destined exclusively for the pupils of singing, of harmony, and of composition.

§ 4.—*Study of Parts.*

ARTICLE XVII.—There is a class for the study of parts annexed to the classes for lyric declamation.

SECTION II.—SINGING.

ARTICLE XVIII.—There are eight classes for singing, conducted by professors.

ARTICLE XIX.—If needed, there may also be formed classes which will be conducted by assistant professors.

ARTICLE XX.—Each class consists of eight pupils and two listeners.

ARTICLE XXI.—One class is specially designed for the execution of concerted pieces for the pupils of the singing classes. The pupils of the classes for composition are bound to take part in it. This class is held once a week by the singing professors in turn.

SECTION III.—LYRIC DECLAMATION.

ARTICLE XXII.—There are four classes for lyric declamation; two for serious opera; two for comic opera.

ARTICLE XXIII.—These classes are conducted by professors, who must be musicians.

SECTION IV.—PIANO AND HARP.

ARTICLE XXIV.—There are five classes for the piano, of which two, for male pupils, are conducted by professors, and three for female pupils are conducted by two professors and one assistant professor. Each class is limited to eight pupils and two listeners.

SECTION V.—STRINGED INSTRUMENTS.

ARTICLE XXV.—There are three classes for the violin, two classes for the violoncello, and one class for the double bass. Each of these classes is conducted by a professor, and is limited to eight pupils and two listeners.

SECTION VI.—WIND INSTRUMENTS.

ARTICLE XXVI.—There is a class for each of the following instruments:—Flute, hautboy, clarinet, horn, chromatic horn, bassoon, trumpet, trombone. All these classes are conducted by professors, and are limited to eight pupils and two listeners each.

ARTICLE XXVII.—There is a class of instrumental part music. Its programmes are so composed that the pupils for the piano, and stringed and wind instruments may take part in it. This class is held once a week by one of the instrumental professors in turn.

SECTION VII.—HARMONY, ORGAN, AND COMPOSITION.

ARTICLE XXVIII.—There are six classes for harmony, namely:—Two for written harmony for the male pupils, held by the professors, having at the most twelve pupils and four listeners. For the male pupils, two for harmony, and for practical accompaniment, held by professors, having at the most eight pupils and four listeners. For the female pupils, two for harmony and for practical accompaniment, one of which is held by a professor and the other by an assistant professor, having the same number of pupils and of listeners. The whole course of harmony and of accompaniment lasts three years at most.

ARTICLE XXIX.—There is a class for the improvisation conducted by a professor. The class is limited to twelve pupils and two listeners.

ARTICLE XXX.—There are four classes for composition, which are limited to twelve pupils and two listeners each, and are conducted by professors. The class is divided into a course of counterpoint and a course of ideal composition.

ARTICLE XXXI.—No pupil is permitted to follow at the same time the classes for harmony and those for composition. Every pupil who aspires to follow the course of composition has to undergo a preliminary examination in harmony.

SECTION VIII.—DRAMATIC ELOCUTION.

ARTICLE XXXII.—There are three classes for declamation, conducted by professors. Each class gives two lessons a week. All the pupils of the classes for declamation are bound to attend at the lessons of the professor.

ARTICLE XXXIII.—There is a dancing master for those pupils who are destined for the ballet. Both of them are sub-masters.

DIVISION IV.

CHAPTER IV.—THE PROFESSORS.

ARTICLE XXXIV.—The body of teachers is composed of professors, assistant professors, and teachers.

ARTICLE XXXV.—The professors are appointed by the Minister of the Interior from two lists: one for all the classes attached to the musical teaching, the one by the Committee of Musical Studies, the other by the Committee of the Conservatoire; and for the classes of dramatic declamation, the one by the Committee of Dramatic Declamation, the other by the director. These two lists are addressed to the Minister of the Interior by the Committee of the Conservatoire.

ARTICLE XXXVI.—The assistant professors are appointed by the Minister of the Interior from three candidates, which is presented by the professors.

ARTICLE XXXVII.—All the professors are divided into four classes, of which the salaries are fixed as follows:—

<i>Professors.</i>	
1st Class	£80 (2,000 frs.)
2nd Class	£72 (1,800 frs.)
3rd Class	£60 (1,500 frs.)
4th Class	£48 (1,200 frs.)

<i>Assistant-Professors.</i>	
1st Class	£40 (1,000 frs.)
2nd Class	£36 (900 frs.)
3rd Class	£24 (600 frs.)
4th Class	£12 (300 frs.)

ARTICLE XXXVIII.—There are two exceptions to this scale of salaries in the case of the professors. 1st. The professors of composition, who receive a salary of £80 [2,000 frs.] 2nd. The professors of elementary class, who receive salaries according to the following scale for the four classes:—

1st	£64 (1,600 frs.)
2nd	£56 (1,400 frs.)
3rd	£48 (1,200 frs.)
4th	£40 (1,000 frs.)

ARTICLE XXXIX.—The assistant professors of elementary classes receive the same salary as the professors of higher classes.

ARTICLE XL.—Every professor, or assistant professor, on his entrance, takes rank in the fourth class. Nevertheless, in an elementary class who is appointed to a higher class of the service, takes rank in that class which is immediately above that which he occupies as an elementary professor.

ARTICLE XLI.—After three years of service

the four classes, each professor has the right to pass into the class above, and receive a salary accordingly. In the case of there being no spare funds, he has a right to the first money that shall become vacant after his promotion. In the case when two professors shall be promoted on the same day, the allowance of money shall be made to him who has served longest.

ARTICLE XLII.—The professors and assistant professors are bound to give three lessons of two hours each per week. Those who, without leave formally granted, or without being authorised by the director, shall fail to give three lessons in the month, shall be deprived of their salary for the said month.

ARTICLE XLIII.—The pensioning of the professors is directed by the Minister of the Interior, on the advice of the theatrical commission.

ARTICLE XLIV.—The professors may be dismissed on account of unpunctuality, or for any other grave reason, on the report of the director or the Government commissioner, and the advice of the theatrical commission.

ARTICLE XLV.—The teachers are appointed by the director, on the nomination of the professors to whom they are attached. They have to give preparatory instruction, under the direction of the professors, to the pupils admitted into the classes. Their duties are only temporary, and must not last longer than three years, during which they themselves may take part in the lessons of the school.

DIVISION V.

CHAPTER V.—COMMITTEE OF INSTRUCTION.

ARTICLE XLVI.—The instruction is regulated by the director, in accordance with the deliberations of the committees of musical and dramatic studies.

ARTICLES XLVII.—The committee of musical studies is composed of twelve members, of whom nine, including the director and the Government Commissioner, belong to the Conservatoire; the three other members are chosen by persons who are not members of the establishment.

ARTICLE XLVIII.—The committee of dramatic studies is composed of the director, the government commissioner, the professor of the classes of declamation, and of three members who have nothing to do with the establishment. The government commissioners for the Théâtre Français and the Odéon have likewise to be present at its sittings.

ARTICLE XLIX.—The members of the committee of musical studies and of that of dramatic studies are appointed by the minister of the interior, on the proposal of the director. They are appointed for three years at least.

ARTICLE L.—The professors of the Conservatoire, who are members of the committee of musical studies, must be taken from the different sections of the instruction.

CHAPTER VI.—THE CLASSES AND THEIR MANAGEMENT.

ARTICLE LI.—The scholastic year begins on the 1st October, and finishes immediately after the competitive examinations.

ARTICLE LII.—All the classes are conducted within the walls of the Conservatoire.

ARTICLE LIII.—The instruction of the male is separated from that of the female pupils, except in the classes of lyric and dramatic declamation.

ARTICLE LIV.—The mothers of female pupils are allowed to be present at the lessons.

ARTICLE LV.—The director fixes the days and the hours of the classes of each professor. He distributes into the different classes the pupils admitted by the committees. He can make a pupil change classes if he considers that this change will assist his progress.

CHAPTER VII.—THE PUPILS, THEIR ADMISSION, THEIR RIGHTS, AND THEIR DUTIES.

ARTICLE LVI.—Candidates for the classes of the Conservatoire must have their names put down in the secretary's books.

ARTICLE LVII.—No candidate will be admitted who

is less than nine, or more than twenty-two years old. Beyond this limit admission is granted only in the case when the candidate is considered sufficiently advanced to finish his studies in two years, or when he is gifted with extraordinary talent.

ARTICLE LVIII.—The candidates are examined and admitted by the committees.

ARTICLE LIX.—There are two examinations for admission—one in the month of December, the other in the month of June, at the conclusion of the half-yearly examinations of the classes. There is a third examination in the month of March, but only for candidates for the singing classes.

ARTICLE LX.—After their first examination the pupils are admitted, but only provisionally. Their final admission is granted only after the half-yearly examination which follows that of their temporary admission.

ARTICLE LXI.—Every pupil admitted—even those temporarily—must send up to the secretary a certificate of his birth, and another certifying that he has been vaccinated.

ARTICLE LXII.—After his final admission, the pupil has the right to remain in the classes at least one year.

ARTICLE LXIII.—The professors have the right to be present at the examination of candidates, each in his department.

ARTICLE LXIV.—The director may admit, without the concurrence of the committee of musical studies, candidates for the classes of solfeggio, part-singing, and instrumental part music. He may likewise admit candidates, or those pupils who desire to follow the courses which follow, to the classes of composition, counterpoint, and fugue, harmony, keyed instruments, the study of parts, lyric declamation, and theatrical deportment.

ARTICLE LXV.—The name of every pupil that misses his classes twice in a month without a legitimate excuse will be erased from the register.

ARTICLE LXVI.—No pupil may, under pain of dismissal, contract an engagement with any theatre, play a part, sing or execute any piece in a theatre, or orchestra, or at a public concert, without the express permission of the director.

ARTICLE LXVII.—Foreign candidates may be received with our special authorization. They enjoy the same privileges and have to fulfil the same duties as the national pupils.

ARTICLE LXVIII.—A report on the entrance and leaving of the pupils is sent to the Minister of the Interior every three months.

CHAPTER VIII.

ARTICLE LXIX.—There is a boarding-house for ten male pupils who are specially destined for lyric studies.

ARTICLE LXX.—An equal number of exhibitions of £32 (800 frs.) each is granted to the female pupils.

ARTICLE LXXI.—Eight exhibitions of £32 [800 frs.] each are granted to pupils of both sexes who follow the classes for special declamation.

ARTICLE LXXII.—The pupils that are admitted to the boarding-house are boarded, clothed, and maintained at the expense of the state.

ARTICLE LXXIII.—The admission to the boarding-house and the distribution of the exhibitions take place only after a competition before the committee of instruction. The candidates for the boarding-house are admitted on trial for six months; their final admission can only take place after a new examination.

ARTICLE LXXIV.—Every pupil admitted to the boarding-house, or to whom an exhibition is granted, contracts in so doing to make his début at the expiration of his studies at one of the theatres (which receives a grant from the state). This obligation gives him the right also to make his début at one of these theatres.

ARTICLE LXXV.—The boarding-house is placed under the superintendence of a principal musician. A code of regulations of government and discipline will provide for measures relative to the boarding-house, the external

establishment, the details of the classes, and of the internal arrangements.

ARTICLE LXXVI.—If the government considers it right to make a candidate come from the departments, twopence halfpenny a mile (*quinze centimes par kilomètre*) is granted to him for the expenses of his journey to Paris, and two shillings (*deux francs cinquante centimes*) a day at Paris, to be reckoned from the day of arrival to that of departure, if he has not been admitted; in this latter case he receives the same indemnity of twopence half-penny a mile for his return.

CHAPTER IX.—THE HALF-YEARLY EXAMINATIONS, COMPETITIONS, AND EXERCISES.

ARTICLE LXXVII.—All the classes are examined by the committees of instruction in December and in June, in order to judge the results of the studies.

ARTICLE LXXVIII.—There is also a supplementary examination in March for the classes of singing and dramatic declamation.

ARTICLE LXXIX.—The half-yearly examination in June has likewise for its object the determination of those pupils who are to take part in the competitive examinations.

ARTICLE LXXX.—All the classes have competitive examinations. The competitions of the classes of Solfeccio, the study of keyed instruments, and oral harmony are not public. The competitions in composition, harmony, and accompaniment take place in private. The pupils of the class of lyric composition compete at the Institute for the grand prizes in musical composition.

ARTICLE LXXXI.—Every class, whatever be the title or rank of its professors, may bring to compete any pupils who may be judged worthy by the committee.

ARTICLE LXXXII.—The pupils of the same sex and of the same speciality, whatever be the number of the classes or that of the competitors, compete together. The pupils of both sexes are only examined together in the competitions in special and lyric elocution, and in oral harmony.

ARTICLE LXXXIII.—The pupils of the Solfeccio class are not allowed to compete when more than fifteen years old, except in cases of which the committee of instruction is to be judge.

ARTICLE LXXXIV.—The pupils who have studied less than six months, and those who, having made their *début* in theatres, remain nevertheless in the classes in order to render themselves more perfect, are not allowed to compete.

ARTICLE LXXXV.—Every pupil who, after two years and a half of study, has not been admitted to the competitions, has his name erased from the register. Those pupils also are dismissed from the Conservatoire who, having competed three times, have obtained neither a prize nor an accessit; and also those who, having obtained a second prize, have competed unsuccessfully twice for the first prize.

ARTICLE LXXXVI.—The public competitions commence on the first Monday in August.

ARTICLE LXXXVII.—The subjects for competition are determined every year by the committees of instruction on the proposition of the director.

ARTICLE LXXXVIII.—There can only be granted one first prize, one second, and three progressive accessits in all the branches of instruction, for the pupils of each sex, in the classes in which they compete separately.

ARTICLE LXXXIX.—In the case in which the same prize shall be assigned to two or more pupils, the prize shall belong to him who shall have most votes in his favour, and in the case of an equal number of votes, to the eldest, to the exclusion of the others.

ARTICLE XC.—Nevertheless, in the case where the jury shall agree unanimously that the pupils have shown equal merit, a first prize may be granted to each of them.

ARTICLE XCI.—A first prize, a second, and progressive accessits are granted separately to the male and female pupils who compete in the classes for lyric and dramatic elocution.

ARTICLE XCII.—Two honourable mentions, authenticated by medals, are granted at the competition in the studies of keyed instruments.

ARTICLE XCIII.—The jury of each competition, presided over by the director, is composed of four members of the Conservatoire and four non-members appointed by the minister at the proposal of the director. The jury for special declamation is composed entirely of non-members of the Conservatoire.

ARTICLE XCIV.—The professors of the school, or other members of the jury, must decline adjudicating in those competitions in which the pupils to whom they have given instruction in the year take part. All prizes or accessits gained in contravention of this regulation are annulled.

ARTICLE XLV.—The jury first decides if each prize ought to be granted. The president announces the result of this decision, and the prizes are then granted to those that have the majority of votes, by means of *cartes* papers on which each member writes his name. The voting papers are handed over to the president, who places them in the urn, then ascertains the result, and makes it known, proclaiming the number of votes obtained by each competitor, and then the names of the prizemen. The same course is followed with regard to the accessits.

ARTICLE XLVI.—The distribution of prizes takes place in November. Prizes are given to the prizemen, and medals to those who have gained accessits. With them is given a certificate, bearing the name of the pupil, the nature of the prize or accessit, and the date of the year in which it has been obtained.

ARTICLE XLVII.—A pupil who has gained a first prize may remain in his class one year longer, but he is over and above the fixed number.

ARTICLE XLVIII.—In November and in June six lyric and dramatic exercises, are held in the large room of the Conservatoire. The pupils who are named by the director to take part in them cannot be exempted without a legitimate excuse.

DIVISION VI.

CHAPTER X.—THE LIBRARY.

ARTICLE XCIX.—The library of the Conservatoire is public. It is increasing by all new works being deposited there, in virtue of the ordinance of the 29th March, 1834, and by purchase, for which a special sum of money is granted.

ARTICLE C.—The chief librarian has to keep a double catalogue of all the works.

ARTICLE CI.—No work may be lent beyond the Conservatoire without the authorisation of the director.

ARTICLE CII.—There will be added to the library a collection of dramatic masterpieces of all kinds, and of didactic works on the theatrical art, and on the art of declamation.

GENERAL ORDER.

ARTICLE CIII.—The Director and the Government Commissioner for lyric theatres and the Conservatoire are entrusted with the carrying out of the present regulations, under the superintendence of the Theatrical Commission created by the decree of the 2nd January, 1850.

Signed, J. BAROCHÉ,

The Secretary-General DELMAS.

Paris, 22nd November, 1850.

Proceedings of Institutions.

CARLISLE MECHANICS' INSTITUTE.—The last report says that while the year has been marked by no extraordinary event, the Institute has made sure and sound progress. 21 new works have been added in the library, 23 renewed, and 74 re-bound. There are at present over 4,050 volumes in the library. 9,410 volumes have been taken out by the members during the year. During the winter months

three classes have been in operation, which, on the whole, have been well attended. During the season seven lectures have been given—two on Astronomy, by Mr. Mackintosh; one on Earthquakes, by Mr. Lowe; three on America, by the president of the Institute; and one by Mr. Wheatley, on Water. There is a decrease of 16 members as compared with last year. The number is as follows:—Full members and annual subscribers, 327; reading members, 115; total, 442. The Carlisle penny readings have this year been under the auspices of the committee, and they were attended with very great success. The balance-sheet shows that the receipts were £241 12s. 9d., and there is a small balance in favour of the Institution.

LEICESTER CHURCH OF ENGLAND INSTITUTE.—The seventh annual report congratulates the members upon the increase in the number of junior subscribers during the past year. The total number of junior quarterly subscriptions for the year 1863 was 267; that for 1864 is 278. This total amount has, however, been more unequally distributed through the various quarters than in any previous year; the number of junior members in the first quarter being 78, in the second 47, in the third 88, in the fourth 115. In view of this, and in order to secure a larger number of members during the summer quarters, the committee recommend that the annual subscription for the junior members be lowered from ten shillings to eight shillings, payable in advance; the quarterly subscription continuing to be, as before, half a crown. The committee regret to say that the subscriptions of the senior members have fallen off during the past year, and that the balance due to the treasurer has slightly increased. The best thanks of the committee are due to the teachers of the classes for their invaluable assistance. The balance-sheet shows that the expenditure has been £90 5s. 6d., and that there is a balance due to the treasurer of £18 9s. 11d.

WAKEFIELD MECHANICS' INSTITUTION.—The twenty-fourth annual report shows that the number of members was 710. The library has received the addition of 365 volumes during the year, making a total of 6,156 volumes. The elementary evening classes exhibit a steady attendance on the part of the pupils. The number on the books in the adult class was 36, with an average attendance of 14. The number on the books in the boys' class is 50, and the average attendance 15. In the girls' class, although the highest number attending has been 23, yet greater progress has been made than during the preceding year. The drawing class has had an attendance equal to last year, and the progress of the pupils has been, on the whole, satisfactory. The chess club maintains its position as one of the best in the provinces in connection with a mechanics' institution. Twenty-one lectures were delivered during the winter months, the attendance at which showed a falling off from previous years. Amongst them may be mentioned:—Mrs. Clara Lucas Balfour—"Henry the Eighth;" Rev. Hugh Stowell Brown—"Common Sense;" John Rawson, Esq.—"The Life and Times of John Milton;" Wm. Proctor, Esq., M.D., F.C.S.—"On the Colouring Principles of Coal Tar;" E. A. Leatham, Esq., M.A., M.P.—"William, Lord Russell;" Henry Wood, Esq.—"A Glance at Westminster Hall;" G. Dawson, Esq., M.A.—"Dr. Samuel Johnson;" Edmund Wheeler, Esq., C.E., F.R.A.S.—"An inquiry respecting the rational and intellectual powers of animals, and their instinctive faculties as compared with man;" P. O'Callaghan, Esq., B.A.—"The condition of the Primæval Inhabitants of the British Islands;" Rev. H. Griffiths—"The Age of Great Reptiles;" S. W. North, Esq., M.R.C.S.—"Antiquity of Man." The Saturday night savings' bank has continued to attract its usual amount of attention. The number of depositors has been 7,856, being an increase over last year. In the penny readings the attendance showed a great falling off from the previous year, the average for the whole time being only 99. The largest attendance was 260; the smallest, 35. The receipts were £9 1s. 6d.; the expenditure, £7 13s. 11d.

The treasurer's account shows that the receipts have been £283 17s. 2d.

WELCHPOOL READING SOCIETY.—The report of the committee for 1864 says that the subscription list proves that the present position is better adapted for the purposes of the society. The committee have ventured during the past winter to introduce penny readings in furtherance of the general objects of the society, and they entertain a hope of being able from this source to make a considerable addition to the library by the purchase of new books. The financial statement shows that the expenses have been £81 4s. 9d., and that there is a balance due to the treasurer of £21 13s. 9d. This has arisen from the great expense incurred in furnishing the house which was taken in New-street.

EXAMINATION PAPERS 1865.

(Continued from page 550.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

ASTRONOMY.

THREE HOURS ALLOWED.

1. Define a day; a solar day; a mean astronomical day; a lunar day; and a sidereal day.
2. State the difference between the civil, or common method of reckoning time, and the astronomical method.
3. Give the rule for determining astronomical time from civil time.
4. What is the equation of time, and for what purpose is it used.
5. Does the equation of time ever vanish, and if so when?
6. Does the equation of time vary from year to year, and if so why?
7. State what methods you know to determine mean time by observation.
8. Define sidereal time at mean noon.
9. The sidereal time at mean noon at Greenwich on January 1st, 1866, will be 18h. 43m. 38.3s., what will be the mean solar time corresponding to January 1st, 21h. 44m. 7.9s. sidereal time?
10. Convert 6h. Greenwich mean time on January 1st, 1866, into sidereal time for the same meridian.
11. Give an expression for finding the length of the day at any place.
12. What is the latitude of those places where the sun does not set for 24 hours on the 21st of June; and also of those places where the sun does not set for 24 hours on the 21st of December.
13. When is the sun due east on a given day?
14. Define moon's semi-diameter, and state when it is used, and for what purposes.
15. Define moon's horizontal parallax, state when and how it is used, and for what purpose.
16. The right ascension of the sun on

	b.	m.	s.
January 1, 1866, at mean noon	18	47	31
" 2, " "	18	51	55
" 3, " "	18	56	20
- What is the right ascension of the sun at Greenwich on Jan. 1st, 18h. mean time?
17. What is the right ascension of the sun on January 1, 1866, at 6h. Venice mean time, the longitude of Venice being 12° 21' 21" east of Greenwich?
18. Explain Kepler's laws.
19. Mention what is known of variable periodic stars.
20. Mention what is known of the prismatic spectra of stars and of planetary nebulae.
21. Mention what you know of astronomical instruments, particularly the transit, mural-circle, transit-circle, and equatorial, with their uses.
22. Explain the use of the method of differences in the interpolation of series.

23. Given right ascen. $\begin{matrix} \text{h. m. s.} \\ 2 \ 57 \ 50.74 \end{matrix}$ on 1st day at mean midnight

$\begin{matrix} 2 \ 56 \ 53.87 \end{matrix}$ on 2nd "
 $\begin{matrix} 2 \ 55 \ 58.06 \end{matrix}$ on 3rd "

Required accurately, using second differences, the right ascension on the 2nd day at 11h. 39m. mean time.

24. Given, the sun's declination at mean noon on

$\begin{matrix} \text{h. m. s.} \\ \text{Jan. 19, 1866} = 23 \ 26 \ 14.8 \\ \text{" 20, " } = 23 \ 26 \ 56.8 \\ \text{" 21, " } = 23 \ 27 \ 14.0 \\ \text{" 22, " } = 23 \ 27 \ 6.4 \end{matrix}$

Required, the exact declination on the 21st day at 4h. 38m. mean solar time.

PRINCIPLES OF MECHANICS.

THREE HOURS ALLOWED.

1. State, without proof, the fundamental propositions which belong to statics, dynamics, and hydrostatics respectively.

2. Find the conditions of equilibrium of any number of forces acting in any direction on a material particle. Ex.: Three ropes, attached by a ring to a heavy block, are each stretched, at right angles to each other, by a weight of 50 lbs. What weight should be attached to a single rope that it may produce an equal effect upon the block, and how must it be placed with regard to the other three ropes?

3. Describe the common steelyard, and show how to graduate it. Ex.: A steelyard, having a weight of 10 lbs. at one end, and a scale-pan weighing 6 lbs. at the other end, is used as a balance by moving the rod backwards and forwards over a fulcrum, on which the whole rests; neglecting the weight of the steelyard, show how to graduate it.

4. Define the moment of a force about a point; show how it may be geometrically represented, and hence show that the sum of the moments of two non-parallel forces about a point in their plane equals the moment of their resultant about the same point. Show that the above statement is true if the forces be parallel. Ex.: Two parallel forces, 8 and 9, act at a distance of 17 inches from each other; what is the moment of their resultant about a point 12 inches distant from that force which is nearest to it, an inch being taken as the unit of length?

5. How do we obtain a measurement of variable velocity at any particular instant? What is the law of the velocity of freely falling bodies? Ex.: A body is projected downwards with a velocity of 80 feet per second; determine the velocity at the end of five seconds; if instead it were projected upwards, when would its velocity cease?

6. A body is acted upon continually by a given pressure; show what acceleration is given to its motion. Ex.: A body weighing 30 lbs. slides along a smooth horizontal plane under a constant pressure of 15 lbs.; determine (1) the velocity it acquires every second; (2) the velocity at the end of 5 seconds; (3) the space passed over in 5 seconds. What would be these results if the plane were rough, and the co-efficient of friction were .2?

7. A body slides down a smooth curve; state and prove what velocity it will acquire at the end of the curve. Ex.: A stone is tied to the end of a string of 10 feet in length, and describes a vertical circle of which the string is the radius; if at the highest point it move at the rate of 25 feet per second, what will be its velocity at the lowest point?

8. What is a cycloid? Show that the time of oscillation of a particle moving in a cycloid is independent of the extent of the arc of oscillation. Ex.: If the radius of the generating circle be 10 feet, what is the time of an oscillation?

9. What is the fundamental principle, known as D'Alembert's principle, employed in rigid dynamics?

Ex.: A sphere has a spherical eccentric cavity filled with water, and rolls on a rough horizontal plane; find its motion.

10. What are the differences between elastic and non-elastic fluids? Give examples of each.

11. Prove that the pressure at any point below the surface of a uniform fluid which is at rest under gravity alone varies with the depth. What is the pressure tending to drive in the cork of an empty bottle sunk to the depth of 800 fathoms in seawater (S.G. = 1.028), when the barometer is 30 inches (S.G. of mercury = 13.6, the area of the cork being a square inch? N.B.—1 cubic foot of distilled water weighs 1,000 oz.

12. Describe a common hydrostatic balance and show how by means of it to find the S.G. of a solid body—: heavier, (2) lighter than distilled water, the latter being used as the unit of measurement. Ex.: A crystal of saltpetre weighs 19 grains; when covered with water (S.G. = .96) the whole weighs 43 grains in air; find the S.G. of the saltpetre.

13. Describe a condenser, and find the corresponding densities of the air before and after a given number of strokes.

14. Describe the essential parts of a double-acting condensing steam-engine. State what you know of the latest mechanical improvements applied to this kind of engine.

PRACTICAL MECHANICS.

THREE HOURS ALLOWED.

1. In toothed-wheel work what is meant by the *pitch-circle* and the *pitch of a tooth*; what is the diameter of the pitch circle of a wheel having 88 teeth of $2\frac{1}{2}$ inch pitch?

2. Explain the contrivance of the *crank and connecting-rod*, for converting circular into reciprocating motion, and show that the movement which would result from a crank with an infinite connecting rod may be imitated by the use of an *eccentric circle*.

3. Explain the following mechanical contrivances: (1) the anchor escapement, (2) the mangle wheel, (3) the Geneva stop, (4) the fusee.

4. A wheel (A) is fixed in space; an arm carrying two other wheels (B) and (C), is capable of revolving about an axis through the centre of (A), and it is further arranged that the three wheels shall gear together, so as to form a train (A), (B), (C); what will be the motion imparted to (C) by the revolution of the arm, (1) when (C) is equal to (A), and (2) when it contains half as many teeth as (A); explain your answer, and point out the value of the first combination in machinery for twisting strands into rope.

5. Explain the *parallel motion* of a beam-engine.

6. Upon what principle is machinery for drilling made self-acting? Select an example which illustrates your statement.

7. Describe some arrangement which would serve to indicate the number of revolutions made by a carriage wheel in a given time.

8. Explain Newcomen's atmospheric engine, and show how it was altered and improved by Watt.

9. Why is it advantageous to work a steam-engine expansively; if steam of a given pressure be cut off when the piston has described one-fourth of its stroke, find the work done in the cylinder. What is the lap of a slide-valve, and what effect does it produce in the working of the engine?

10. Sketch a double-beat valve, and explain its action.

11. Explain any form of gauge for measuring the pressure of steam in a boiler.

12. Describe the general arrangement of a locomotive engine and boiler, and explain Stephenson's link motion for reversing the engine.

(To be continued.)

THE MUSICAL UNION INSTITUTE.

The following is extracted from Mr. Ella's *Musical Record* :—

The objects sought to be accomplished by the formation of an Institute have never ceased to occupy my attention since the idea was first mooted in the *Record* of 1849. The interest which the lamented Prince Consort took in the promotion of the arts in general, his knowledge of and taste for music in particular, were most encouraging; and his express desire to the late noble President, the Earl of Westmorland, to carry out a design similar to the one I have attempted, was communicated, confidentially, to me in 1853. In a letter addressed to me in that year by a liberal patron of the art, a thousand pounds was promised in aid of the scheme, provided my small beginnings were joined to that of the Prince Consort for a public library. During the short time that elapsed from the opening of the Musical Union Institute until the lamented death of that excellent Prince, the donations exceeded in amount my most sanguine expectations. The death, however, of the Prince at once threw a damp on the public mind, and further contributions in hope of realising all that was aimed at fell short of what I had reason to anticipate.

This disappointment was the more to be deplored, since, in order to provide for the expected donations and purchase of musical publications, a large portion of the funds was already expended in furniture for the residence of a paid custodian, with ample accommodation for an extensive library.

It is now proposed by the treasurer and trustees to relieve me of the custody of books purchased and presented to the Institute. At the same time, with the funds at my disposal, I shall continue to increase the collection of music and musical literature, and add it to the property to be conveyed to the South Kensington Educational department of the Fine Arts.

To those spontaneous donors who encouraged my efforts to carry out a long cherished object, I cannot sufficiently express my gratitude. In acknowledgment of the support received from donors to the Musical Union Institute, I propose, with the sanction of the Committee, to issue singly free admissions to the *Matinées* of the Musical Union, viz., to donors of £20, four; £10, two; and £5, one, each season.

J. ELLA.

(COPY.)

London, 18, Hanover-square, May 18, 1865.

To the Secretary of the Department of Science and Art.

SIR,—Having long witnessed, with gratification, the facilities afforded at the South Kensington Museum for education in the Arts of Design, etc., and various branches of scientific pursuits, with the formation of libraries for study and reference, I have ventured to hope that music, the most popular and neglected of the arts in England, might also be specially encouraged at the South Kensington Museum.

An arrangement might, perhaps, be made to accommodate an extensive library of music, full scores of the great masterworks, and musical literature, with a collection illustrating the history and progress of musical instruments, for the use of the public in general and students in particular. Considering the great difficulties, cost, and risk, which attend the trials of new compositions of the highest class of art, I would suggest that it might be expedient that the Government should afford facilities analogous to those which have been given to the Royal Academy of Arts for the exhibition of painting, etc., for such trials, and also that lectures might be given on every branch of the art, the whole eventually becoming a recognised institute for musical education in this country.

That such an Institute was contemplated by the lamented Prince Consort, I have reason to know, and, with the view of aiding its accomplishment, I proposed, in

the name of the trustees, W. Tite, Esq., M.P., and T. Brasse, Esq.,* and donors of the Musical Union Institute, under my direction, to submit to them the propriety of offering the gift of its collection of music and musical literature.

On certain specified conditions, at my decease or before, I propose that my private collection of music, musical literature, pictures, prints, autographs, and musical instruments, be added thereto, and the sum of one thousand pounds, or more, be given in aid thereof. Other gifts, I feel sure, will follow, and ultimately London will be spared the reflection of being the only city in Europe without a National Institute and Library exclusively devoted to the interests of the musical art.

I request you to submit this proposal to the Lord President of the Council for his consideration.

I remain, Sir, your obedient servant,

(Signed) JOHN ELLA.

Hon. Mem. Phil. Acad. Rome,
Founder and Director of the Musical Union.

(COPY)

42, Lowndes-square, June 27th, 1865.

MY LORD,—The "Musical Union Institute" was established in 1850 by Mr. Ella. Mr. Brasse and myself were appointed trustees; Sir George Clerk was the president; and a most respectable body of subscribers and donors soon joined the Association. We have subsequently done our best to carry out the intentions of the founder, and to support his views. Those views were to collect a library of music and musical literature, to form a museum of musical instruments, and to afford accommodation for the trials of music and encouragement to young and meritorious artists. All this we have endeavoured to carry out and support, and to a certain extent we have succeeded.

It has, however, occurred to Mr. Ella that this Institution might find a more permanent home at South Kensington, and I am authorised by a public meeting of the donors to offer to your lordship and the Council the collection of books belonging to the Institute.

In making this offer, we are requested to attach this condition: That the Council will carry out, as far as is consistent with the means at their disposal, the original objects of the Institution. I am to submit this proposition to your lordship, and to offer any explanation in my power of the views of Mr. Ella in proposing the removal of the Institute to South Kensington.

In furtherance of the above objects, I am authorised to say that as soon as accommodation is made for its reception, the harpsichord (A.D. 1651) of the great Handel, now the property of Messrs. Broadwoods, will be presented to the library.

I enclose an account of the inauguration ceremony, at which Mr. Brasse, myself, and the Council were present, which fully states all the objects sought to be obtained by the Institution, and a supplementary paper published under its sanction.

I have the honour to be, &c.,

(Signed)

W. TITE.

Treasurer and Trustee.

The Rt. Hon. Lord Granville, &c.

The following answer to Mr. Tite's letter is couched in similar terms to one in reply to Mr. Ella's, in May last :—

Council of Education, Kensington Museum, 29th June, 1865.

SIR,—I am directed by the lord president to acknowledge the receipt of your letter, dated the 27th, and addressed to him, in which you are so kind as to offer, on behalf of the Musical Union Institute, a collection of books, and the harpsichord of Handel, on the condition that the department will carry out, as far as it is consistent with the means at its disposal, the original objects

* Donors of £100 each.

of the Musical Union Institute; and in reply I beg to inform you that the lords of the Committee of Council on Education have much pleasure in accepting the gift for the South Kensington Museum, on the conditions that you have named. Thanking you for your own personal interest in the subject,

I have the honour to be, Sir,
Your obedient servant,
HENRY COLE.

Fine Arts.

ART CONVENTIONS.—Three other acts, which aid towards the completion of international right in works of taste and intellect, have just been officially announced in Paris, namely, the signature of conventions respecting literary and artistic property between France and Saxony, Baden, and Nassau.

DISCOVERY OF A LOST RAPHAEL.—A picture by Raphael, known as the *Madonna di Loreto*, had been lost for a long time, and is said to have been recently discovered in the shop of a dealer at Mantua, by M. Tortella, of Verona. It was covered with such a thick coat of dirt that the lines of the composition could scarcely be traced, but was easily cleaned. The picture has since been examined by Professor Blass and other acknowledged judges, all of whom pronounced it not only to be a true Raphael, but in his best style. It is in admirable preservation, and measures four feet in height and three in width.

PRIZE COMPETITION IN BRONZES IN PARIS.—The manufacturers of bronzes have announced a competition amongst the artists and workmen employed in that important and elegant branch of Paris industry. The prizes to be distributed are to consist of medals and honourable mentions, and the following amounts in money:—For sculptors and ornamental modellers, each 800*fr.*; chasers, 1,600*fr.*; designers, 500*fr.*; founders, 600*fr.*; turners, 400*fr.*; mounters, 800*fr.* The works are to be sent in by the 16th of November. It is not stated whether there will be a public exhibition of the works, but it is to be hoped that there will, not only in justice to the artists and workmen themselves, but also as an excellent means of general art education.

MUSEUM OF MEDALS.—The Duc de Luynes some time since presented his magnificent collection of medals to the Bibliothèque Impériale of Paris, on condition that it should be maintained and exhibited to the public in a completely independent condition. In pursuance of the terms of the donation the medals have been arranged in a rotunda, and several adjoining apartments in the new portion of the library building, and a special door and staircase are now being constructed by which the public will be admitted to the Luynes gallery.

Manufactures.

BUTTER-MAKING.—It is well known that cream may be converted into butter by simply being buried in the ground, but it is not generally known that this mode is in common use in Normandy and some other parts of France. The process is as follows:—The cream is placed in a linen bag, of moderate thickness, which is carefully secured and placed in a hole in the ground, about a foot and a half deep; it is then covered up and left for twenty-four or twenty-five hours. When taken out the cream is very hard, and only requires beating for a short time with a wooden mallet, after which half a glass of water is thrown upon it, which causes the butter-milk to separate from the butter. If the quantity of cream to be converted into butter is large, it is left more than twenty-five hours in the ground. In winter, when the ground is frozen, the operation is performed in a cellar, the bag being well covered up with sand. Some persons place the bag containing the cream within a second bag, in order to prevent

the chance of any taint from the earth. This system saves labour, and is stated to produce a larger amount of butter than churning, and of excellent quality, and is, moreover, said never to fail.

STEAM FIRE-ENGINES AT THE COLOGNE INTERNATIONAL EXHIBITION.—The following is a copy of the official report concerning the decision of the jury at the trial of steam fire-engines held at Cologne:—The adjudicators, when judging of the steam fire-engines, paid attention chiefly to the following points:—1. The time required for getting sufficient steam to work the engine. 2. The quantity of water in general, and especially its density in proportion to the distance over which the water was thrown. 3. The height of the stream. 4. The general construction of the engine, and especially its durability and steadiness while being worked. 5. The weight, from which to draw conclusions as to their transportability. As regards the getting of steam for working the engines, the engine of Messrs. Merryweather and Sons of London, effected this in 7 minutes 28 seconds; that of Messrs. Shand, Mason, and Co., of London, in 11 minutes 28 seconds; and that of Messrs. Wirth and Co., of Frankfurt-on-the-Maine, in 16½ minutes. At a distance of 40 feet the largest quantity of water was thrown by the engine of Messrs. Shand, Mason, and Co.; the second in this respect were Messrs. Wirth and Co.; whilst as regards the compactness of the stream the latter decidedly took the first place, and Messrs. Shand, Mason, and Co. were second in this respect. At a distance of 60 feet, Messrs. Wirth and Co. took the first place, and Messrs. Merryweather and Sons the second place. As, however, the dimensions and working power of the engines are taken into consideration, then Messrs. Merryweather and Sons are fairly entitled to the first place; there is also to mention that the engine of Messrs. Wirth and Co. was worked during a wind that was more favourable than that under which the other two had to stand the trial. Concerning the heights of the streams, the engine of Messrs. Wirth and Co. was first, even if full consideration is given to the unfavourable wind which the other two engines had to work against. All practical questions, as regards the construction of steam fire-engines, have not yet been decided. All three engines are of solid workmanship, and fully warrant, during the usual duration of working time, as regards steadiness, every advantage that could be wished for. The weights of the engines are as follows:—Messrs. Merryweather and Sons, 3,813 lbs.; Messrs. Shand, Mason, and Co., 6,128 lbs.; Messrs. Wirth and Co., 5,833 lbs. Considering the short space of time in which Messrs. Merryweather and Sons' engine commenced working after the time of lighting the fire, and considering the proportionately equal results in other respects, and, further, in consideration of the strikingly light weight of the engine, the adjudicators declare that they have awarded to the steam fire-engine of Messrs. Merryweather and Sons, of London, the money prize of 500 thalers, and a gold medal to the steam fire-engine of Messrs. Shand, Mason, and Co., of London; also a silver medal, granted by the ministry, to the steam fire-engine of Messrs. Wirth and Co., of Frankfurt-on-the-Maine.

Colonies.

NATAL EXHIBITION.—A Natal journal of April last says:—"It has been announced that arrangements are in progress for holding an exhibition in this city (Pietermaritzburg) at an early period. The object of the exhibition is to encourage industrious and productive habits amongst the natives, and it is hoped that it may also serve as a valuable suggestion in directing the course of native labour."

THE CLIMATE OF AUSTRALIA.—The great characteristics of the climate of Australia appears to be its dryness and purity of solar light, and freedom from humidity and the

sequent smaller proportion of deleterious gases and malaria in combination with an almost total absence of animal and vegetable decomposition; the astringent and venical properties of the atmosphere may be observed in its action on gun and other metals, which may be exposed out of doors, day and night for months (except in dry weather), without contracting any oxidation; also the facility with which all animal and organic substances are dissolved and volatilised, and the bones bleached to a snowy whiteness in a comparatively short period. In summer the carcase of a horse or bullock becomes a beautifully bleached skeleton in 10 to 14 days, the knife easily having been employed to take off the hide. In no other country is the climate so congenial to man's physical vigour as that of the Australian colonies—both man and beast can undergo all the fatigue of daily labour with less exhaustion and greater endurance than in any other country.

SHALE OIL IN NEW SOUTH WALES.—A discovery of considerable importance is said to have been made in the Hawera district. It had long been known that a highly inflammable substance abounded in that locality, but it was only recently that the fact of its containing a large amount of kerosene oil has been discovered. It appears that at a short time ago two gentlemen, practically acquainted with the manufacture of oils, paid a visit to the district. They took specimens of the shale in which the oil was expected to be found back with them to Sydney, and submitted them to analysis, which showed them to be very rich in oil. Twenty-one pounds of shale, put into a common iron pot, with a worm attached, in a short time yielded a quantity of oil, which was of very good marketable quality. The quantity yielded by the twenty-one pounds of shale was one gallon, and this, too, with a most imperfect apparatus. It is believed that, with a proper apparatus, the shale will yield fifty per cent. of oil. The oil can be produced and packed in tuns at one shilling and sixpence per gallon, whilst the price in England during the past few years has ruled from three shillings and nine-pence to six shillings per gallon.

WOODS OF NEW SOUTH WALES.—There are in the museum at Sydney hundreds of specimens of wood, the principal of which are rosewood, beefwood, cypress, pine, forest oak, and tulip wood. 308 specimens of softwood, as well as hardwood, were sent to the International Exhibition of 1862, and a variety of cabinets were made with duplicates of them, by Messrs. Howard & Son, of Oxford-street. Rosewood is probably the most beautiful of those which have yet been worked either in the colony. Although called rosewood there, it is entirely different in colour from the purple red rosewood of Brazil, the Canary Islands, &c. Its colour is truly the same as the mahogany of Honduras and Camaguey, and undoubtedly equal in beauty of grain as well as durability to the products of these places. The fine acacia which furnish these woods grow to an immense size. The timber is found to be very durable in wet soils, and therefore is in great demand for posts and rails. It is easily worked. Beefwood in colour and grain is truly beautiful, and would be most useful for veneers. Cypress and forest oak are very fine but different species of acacia. Tulip wood is also a very fine wood, but apt to split in

colony, from the year 1850 to 1863. The volume can be bought at the office for the sale of parliamentary papers, price 4d.

Notes.

PARIS GREAT EXHIBITION OF 1867.—It is said that the Champ de Mars has been definitely decided on for the locality of the next great International Exhibition, and that the preparatory works will be commenced on the sixteenth of August, the day after that of the Imperial fête. The building to be erected there will, however, only contain the industrial portion of the Exhibition; the fine arts will be represented in the Palais de l'Industrie, in the Champs Elysées, on the opposite bank of the Seine, where the annual salons or exhibitions of the works of living artists are now held.

THE FRENCH GRAND PRIX EN SCIENCE.—In 1859, Napoleon III. instituted by decree a grand triennial prize of twenty thousand francs, to be awarded in turn by the five academies of the French Institut, for the work or discovery reflecting the greatest honour or doing the greatest service to the country, published or made during the ten years preceding the award. In 1861 this prize of honour was given by the Académie Française, to M. Thiers, for his "History of the Consulate and the Empire;" in 1863 it was awarded by the Académie des Inscriptions et Belles Lettres, to M. J. Oppert, for his labours in connection with the cuneiform inscriptions of the valley of the Euphrates; this year the prize has been given by the Académie des Sciences, to M. Wurtz, Professor in the Faculty of Medicine in the University of Paris, for his labours and discoveries in organic chemistry. M. Wurtz's name is especially connected with the discovery of the ammoniacal compounds and glucose, and his chief work is entitled "*Leçons de Philosophie Chimique*."

MECHANICAL MUSIC.—A question of some importance to musical composers and publishers was discussed a few days since by the French Legislature. Certain French and Swiss manufacturers have recently introduced a system by which various tunes may be played on mechanical organs and other instruments, with the aid of metal plates or wood blocks; and one ingenious maker, at Marseilles, has succeeded, it is said, in using cardboard and even paper forms, which he can multiply and sell at very moderate prices. A bill was introduced to legalise such applications, but it was warmly opposed, on the ground that it would be sanctioning an infringement of the rights of musical composers and proprietors of musical compositions. It was argued by the supporters of the bill that the method in question did not fall under the law of copyright, and that such productions were not equivalent to publication, or editions, of the works in question. A letter was read from Rossini, in which the *maestro* declared that he loved to hear his music played in the streets; but, on the other hand, a memorial was presented against the proposed measure, to which were attached the signatures of Auber, Berlioz, Thomas, and many other composers. The Corps Législatif passed the bill by a majority of 188 against 34, but the Senate, on a report brought up by M. Mérimée, rejected it.

GAS IN PARIS.—The first attempt in lighting the streets of Paris with gas was made on the last night in the year 1829, but it was not until after the revolution of July, in the following year, that it was generally adopted in the principal quarters of the city. In 1855 the consumption was under forty-one million cubic mètres; in 1860 it had reached seventy-five and a half millions; and in 1863 nearly a hundred and one millions. The pipes made a total of more than a thousand kilomètres, or about sixty miles, in the last named year. There are ten gas works in Paris, eight of which belong to the amalgamated Compagnie Parisienne, one to the Invalides, and the other to the Portable Gas Company. These ten establishments employ about two thousand seven hundred workmen, and

Publications Issued.

STATISTICS OF THE BRITISH COLONIES.—The statistical department of the Board of Trade has just presented to Parliament an "Abstract of Colonial Statistics" on the subject of the "Statistical Abstract of the United Kingdom." This small volume gives, in the most portable and accessible form, the general statistics of each British

forty-three steam engines of a total nominal power of about five hundred horses. The General Gas Company employs also about five hundred men during two or three hours a day to light and extinguish the lamps. Great improvements are being made in the lighting of the city. From the corner of the Rue Royale to the Rond Point a new lamp is being interpolated between each of the original pairs, to the great enlightenment of the Champs Elysees.

VENTILATION OF SEWERS.—M. Robinet, a French chemist, has put forth the following plan of clearing the sewers of Paris, in which a large number of accidents have occurred. He proposes to supply the great factories with air for their furnaces by means of tubes communicating with the interior of the sewers. By this means the latter will be cleared of mephitic gases, which will be destroyed by combustion in the furnaces. The quantity of coal consumed during the year in Paris is above 700,000 tons, and supposing that only one-tenth of this combustion can be utilized, M. Robinet calculates that four millions of cubic metres of fresh air, which is more than seven times the contents of the sewers, might be made to enter them daily. M. Robinet proposes to apply the same principle to hospitals, casernes, cesspools, and other places where impure air accumulates. This scheme corresponds with a system of ventilation expounded some time since by General Morin, and practised by him to a certain extent in the Conservatoire des Arts-et-Metiers, of which he is the director-in-chief.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following is the evidence of Mr. Lucas, Principal of the Royal Academy of Music:—

The Committee met on the 22nd May, at 3 o'clock, Mr. HENRY COLE, C.B., in the chair. Present—Sir John Harrington, Bart.; Sir G. Clerk, Bart.; Mr. Bowring, C.B.; Mr. Bowley; Lieut.-Col. Scott, R.E.; Capt. Donnelly, R.E.

Mr. C. LUCAS gave evidence as follows:—

1. You are Principal of the Royal Academy of Music?—I am.
2. And, with the concurrence of the Directors of the Academy, are so kind as to attend here to give us information as to the working of the Academy?—Yes.
3. You hand in (referring to a document in his hand—See Appendix A., p. 572) a statement of the income and expenditure of the Royal Academy of Music for the year 1864?—Yes.
4. Does this include the parliamentary grant of £500?—It does.
5. Also a statement of the amount of tuition given to each student per week?—I may explain that more fully.
6. How long have you held the office of principal of the Academy?—I was appointed to the office in July, 1859.
7. Who was your immediate predecessor in that office?—Mr. Cipriani Potter.
8. Was he the first principal of the Academy?—No; Mr. Crotch. I was myself a pupil of Dr. Crotch at the Academy.
9. Your prospectus shows that the constitution of the Academy consists of a president, four vice-presidents, thirty directors, and a committee of management?—Yes; that is provided by the charter.
10. And it appears the Academy is incorporated by Royal Charter?—Yes.
11. The date of which is 1830, but the Academy was founded in 1822?—It was started in 1822, but was opened in 1823.
12. It also appears an attempt was made in the year 1820, to start a national school of music, but that its aim was simply the introduction and support of the Italian Opera?—They called it the Academy of Music at that time. When what is now her Majesty's theatre was first started, it was called the Academy of Music, when Hansli, Bononcini, and others, wrote operas there. It is merely from the similar name.

13. Would you put in evidence the prospectus of the Royal Academy and the regulations for its management?—Yes. (See Appendix B., p. 572.)

14. Where are your present premises?—Tenterden-street, Hanover-square.

15. Have they always been there?—Yes.

16. And always of the same extent?—When we had boarders they were more extensive. We used to have boarders.

17. You have no boarders now?—No.

18. Why not?—The expense was too great.

19. They are simply day students?—Yes; male and female.

20. Are the premises convenient?—No; very far from it.

21. Is there space sufficient?—No.

22. Do the students for the most part live in the immediate neighbourhood of the premises?—No; they live in various parts. That is one of the great difficulties we have in arranging the periods of their lessons so as to save them time. Supposing they live three or four miles off, it is very awkward.

23. What are the hours of the students' attendance?—Generally speaking, from ten till four; sometimes from nine till four.

24. Do they get refreshment on the premises?—No.

25. Must they go out for refreshment?—Yes; or bring it with them.

26. Have you convenience for refreshments?—No; no special convenience.

27. Do you find inconvenience from the want of such accommodation within the premises?—The lessons are arranged now so that no pupil need be there more than four hours per day. Supposing the pupil were in a singing class, he would be engaged in that for two hours, in the piano class one hour or two hours, and then he might go home and practice. Then another day they go to something else for a similar time. The classes are so arranged; for instance, if a person has a singing lesson for ten o'clock, he remains with the class afterwards for about two hours. The system is this:—Every pupil gets an individual lesson, but it is all done in classes. I put in a statement (Appendix C., p. 573) which is a correct account of the number of lessons each pupil receives per week.

28. For what length of time is the individual lesson?—Half-an-hour. It is in this way:—If the principal study be the pianoforte the pupil has an individual lesson for half-an-hour; but the class consists of four pupils, and each pupil would be present the whole time, hearing the remarks of the teacher. That is a general rule, particularly if all the pupils in the class are about equally advanced. It is practically having a lesson of two hours, but individually the master devotes half-an-hour

to each pupil. Then they go from that to singing, and receive a lesson for half-an-hour each in that class.

29. Do you mean that every pupil has half-an-hour's individual instruction?—Yes; twice a week, excepting in harmony, Italian, and elocution.

30. In those they are taught all together?—For instruction in harmony, we have four pupils in the hour.

31. Do I understand you to say that, of the pupils learning singing, or instrumental performance of any kind, each one has half an hour's personal instruction?—Yes; twice a week.

32. Are the teachers numerous enough to admit of that, or the pupils too few?—It is, perhaps, both.

33. How many pupils at the present time are learning singing.—Nineteen ladies and five males—twenty-four in all, as principal study. Others learn singing. The statement of the classes and professors' attendances for this term answers this in detail.

34. Receiving individual instruction in the way you mention?—Yes; I should wish to explain a little further about their studies. It is this: If a lady goes there and learns the pianoforte as the principal instrument, she has two half-hour's individual instruction, besides attending the class two hours. Then she has a singing lesson and lessons in harmony twice a week. Then, twice a week she is obliged to attend a sight-singing class and orchestral singing.

35. Whether she have a voice or not?—Yes.

36. Do the pupils make choice of their instrument themselves?—Yes: they make their selection.

37. For instance? if a pupil chooses the violin for his instrument, he has to attend a sight-singing class?—Yes; and the orchestral and choral practices. The difference with ladies, who make singing their principal study, is, that they have but one lesson per week on the pianoforte, and one lesson per week in harmony; but then they have Italian twice a-week, and elocution once a-week; which makes the number of hours of individual instruction about the same; and they have also to attend sight-singing, and orchestral and choral practices. It is the same with the male pupils; if the violin be the principal study, they have two lessons per week on the pianoforte, and in harmony, and they attend the sight-singing practice—that is to make them able to read music well.

38. What do you do in the case of the pianoforte players?—They rehearse solos and concertos, with accompaniments. The orchestral and choral practices are on Tuesdays and Fridays. The pupils are brought to those practices to make them acquainted with hearing an orchestra.

39. You make them singers for the nonce?—If they do not play in the orchestra they sing in the choruses.

40. We quitted the subject of the premises rather abruptly. May I ask what is the present tenure of your premises?—The lease has expired. We are now tenants from year to year.

41. Subject to the usual notice?—The landlord, I believe, has no particular wish to disturb us. The fact may be stated that the premises were originally held under a long lease, which has now expired, and we are now only annual tenants.

42. Are you responsible for repairs?—We were under the lease.

43. But you are so no longer?—That depends perhaps on a matter of law.

44. It is no part of your present current expenditure to provide for the repairs of the premises?—We have expenses for repairs.

45. Do you expend funds for repairs without the security of a lease?—Not since the lease has expired.

46. Have you any projects in view for the alteration of the premises?—That is hardly possible; we want both funds and space to do so.

47. Then you have no intention of increasing the accommodation of the present premises?—No; most decidedly not.

48. But you wish for other and better accommodation than you have now?—Decidedly.

49. Does your landlord hold out any hopes of improvement of the present premises?—No; not at all.

50. Are you situate in a neighbourhood you altogether approve of?—No.

51. Perhaps the contrary?—Yes; very much so.

52. I gather that last year there were 59 pupils in the Academy; and this year there are 71?—Yes.

53. Is the course of instruction at the Academy divided into sessions?—We have three terms in the year of about thirteen weeks each. It used formerly to be divided into four quarters; but we found the attendance very small in the summer months, and, therefore, have a long holiday, like most of the colleges.

54. We hear that in 1864 you had fifty-nine pupils and that you have now seventy-one. What has been the average number of the last few years?—They have varied from sixty to eighty. I think on an average have about thirty come every year and thirty gone.

55. In the early history of the Academy, what was the average number of students?—When the Academy was first opened I was myself among the first pupils, and at that time there were eighteen males and eighteen females.

56. After it got into full operation what was the number?—I have known, I think, as many as 160 pupils at a time.

57.—Has there ever been more than 120?—Yes; I think so.

58. I should like to know what is the maximum number. I will endeavour to give it you.

59. I understand you to say that there is orchestral and choral practice every week?—Twice a week.

60. Of what pupils does that orchestral practice consist?—At the present moment we are very deficient in wind instruments.

61.—It appears from this return which I hold in my hand, that there are only three pupils in the Academy now who are learning stringed instruments, and none who is learning a wind instrument?—There are only three making the violin their principal study, but several others learning that instrument, and some wind instruments as second studies. (See Appendix C.)

62. Are you able to make up a complete orchestra of the present pupils of the Academy?—Not completely; we do as well as we can.

63. Can you tell me off-hand how many of the pupils are available for the orchestra?—I should think we have 18 or 20; that is about what my orchestra consists of at the present moment.

64. There are only 5 male vocalists and 17 male pianists, therefore they must be taken principally out of the pianists?—Yes.

65. When you speak of the orchestra, do you include voices and all?—Yes.

66. What I want to arrive at is how many male pupils you can apply to instruments in your orchestra; I do not mean singers?—I should say at least 20. For instance, if the piano is the principal instrument of a pupil, he is obliged to learn an orchestral instrument as well. There is one who plays the flute, another the oboe, two others the violin, some the viola, others the violincello.

67. Do you consider that an advantage in their education? You are obliged from want of funds, apparently, to make up an orchestra in the best way you can, and therefore you bring the pupils into the orchestra; but if you had sufficient orchestral pupils, would you by preference bring in the pianoforte pupils also?—Most certainly, for this reason; however little they may know of the instrument, if they get into composition they will know how to write for the instruments. For that reason every pupil is allowed to take part in the orchestra.

68. Are you aware whether that is the practice abroad?—Not I believe in many cases.

69. Then it arises out of your necessity?—I think that is one of the advantages of the education in this country.

I maintain that students get a better musical education here than they do in the conservatoires of the Continent.

70. You think it an advantage to a pupil who wishes to devote his attention mainly to the pianoforte that he should play the flute?—Yes, I think so. If you look at the regulations of the Academy all that is explained.

71. The rent and taxes of your premises appear to amount to about £300 per annum.—Yes.

72. You say you have only a yearly tenancy of the premises. In the face of the enormous increase of rentals of houses would not that be a difficulty to the Academy in providing new premises, and might you not set aside a larger sum for the improvement of the present premises?—I think it might be difficult to get the accommodation we have now at the same rent; that is, to the same extent.

73. You tell us the accommodation is insufficient?—Yes; on account of the deficiency of funds we put up with many inconveniences. The premises have a less amount of accommodation than formerly, and we think we should have to pay increased rent for the same amount of accommodation elsewhere.

74. I hardly suppose these regulations are those by which the establishment is at present governed?—Yes, they are.

75. Then I apprehend there must be a mistake in your statement that those who wished to learn singing only are called upon to play an orchestral instrument?—Singing pupils have taken the double bass, for instance, but that is not insisted upon. Every singer is taught the pianoforte.

76. Then a pupil who wishes to learn singing must learn also the pianoforte, or some other instrument?—He must learn the pianoforte, but not necessarily any other instrument.

77. Are there any free scholars of the academy?—We have two scholarships which are entirely free, and two others which are partly so.

78. At Vienna the directors of the Academy have the power to give free education to pupils who have distinguished themselves at the commencement of their course, but it is a condition that they should be natives of Vienna. In other cases it is at their discretion to charge half-fees. May I ask if there is anything of that kind in the Royal Academy here?—I may state in the earlier days of the Academy a student, who has since become a distinguished professor, was boarded and educated for several years free; but that was at a time when the funds enabled the directors to do so.

79.—In some other cases has not a portion of the fees been remitted?—In some cases pupils have been admitted at reduced fees.

80.—I think it is desirable we should have from Mr. Lucas, if he will be kind enough to give it us, a statement of the particulars with regard to the system of giving so many lessons per week. I want to get a statement of the exact number of hours during which the pupils receive instruction in the week, and the tuition given to each pupil separately by the teacher?—You mean the number of pupils to each teacher.

81. Yes? and how often he attends.

81a. Do you think it would be advisable to pay the different professors by salary?—Yes, if we had funds to do so.

82. You have different rates of remuneration to your professors?—Yes.

83. Regulated by the *status* of the professor, and the time he gives to the Academy?—I may say all the professors are extremely liberal in their charges to the Academy. In the Conservatoire of Paris they pay their professors, not by the lesson, but by the year.

84. I want particularly to get Mr. Lucas's views on that subject. As it is now, the expense of each pupil is £45 a-year, or nearly that?—We have so arranged matters that the contributions of the pupils, as nearly as may be, reimburse the remuneration to the professors; then there their proportion of the rent and the general expenses.

85. It does more than that; because, by this paper, it appears that musical tuition alone costs only £27 a-year per pupil, whereas their subscription is £33!—Some of them cost more than they pay.

86. I understand you to say you do not pay your professors by annual salary?—No; by the hour.

87. You would prefer their being paid by salary?—Yes; I think so.

88. To pay by salary would be more expensive to the Academy?—Yes.

89. Have you considered the question of the desirability of paying the professors by salary with a proportion of the fees of the pupils, it being found in other public institutions a very convenient mode of payment?—No; I have not considered that question as yet.

90. As far as you know, is it true or not that professors of music habitually charge less for tuition at schools than they do for private tuition?—Some may, and no doubt do so. There are all sorts of prices paid.

91. And do they not charge now considerably less at the Academy than they do for private tuition? I believe some professors charge as low as half.—Yes; but, generally speaking, when they teach at schools, they have a sufficient number of pupils there to occupy them for half a day or more at a stretch; and then at schools they teach by the quarter or term; and they take the chance of all the pupils not always coming to receive their lessons.

92. Is it not to be presumed that professors would continue to teach at the Royal Academy at the same rate of remuneration as they are receiving now?—That is a question I can scarcely answer.

93. I presume there is some little distinction to be derived from being a teacher at the Royal Academy, and if it were established on a more important basis than at present, there would be all the more distinction in teaching there; therefore, I presume any reduction they now make would be made there?—I do not apprehend there would be much difficulty about that.

94. Are you able to state the essential difference between the Royal Academy of Music and the foreign Conservatoires?—First of all in the constitution and management. The management of the Royal Academy is explained in that prospectus, but most of the foreign Conservatoires are managed by the government.

95. Is that, in your opinion, an advantage?—In this respect, that the pupils are educated without charge.

96. Do you think it an advantage that the students should pay nothing for their education?—I think so. When this Academy was first opened, there were ten students elected on the foundation, and they were boarded and educated, and paid £10 a year. Then they admitted eight males and eight females, and these were called extra students. I was one of the first of that class, and I had to pay £30 a year.

97. You were boarded for that amount?—Yes; and educated.

98. Can you give any reason why music should be taught gratuitously when it is usual to pay for all else?—The principal reason is, as in the case we have been speaking about; generally you find great natural talent where there are no means to pay for the education. At Eton, Winchester, and other colleges, there are free students, why should not music be placed in the same scale?

99. But making the exception in favour of great talent—putting that aside for the moment which cannot pay for itself, and which it may be desirable to encourage, do you think, as a general principle, musical education should be gratuitous?—No.

100. You have mentioned the foreign Conservatoires. Is it not the case, in most of them, that the musical and operatic establishments are supported by the Government to a certain extent?—Yes.

101. In Leipzig there is no state subvention. The Academy is independent of the Government, and is supported by the subscriptions of the pupils and the dona-

tions of the public. It is the same in Vienna. It is the same, I believe, in Naples, Milan, and Brussels.

102. You have been asked about the foreign opera-houses being subsidized by the state; do you think they are better than our own?—In this country they are entirely the speculation of private individuals.

103. I mean the music itself; for instance, that the Italian opera of London is not as good as the Italian opera of Naples?—It is quite as good.

104. And as that of Paris?—Yes.

105. You think, notwithstanding our opera-houses are not subsidised by the state, we hold our own against those which are?—Yes.

106. As to the constitution and management, do you think there is any great difference between the management of the Royal Academy of Music and that of the foreign Conservatoires?—Yes; there is a great difference. The only Conservatoire I know much about is that of Paris. I was there at the time Cherubini was principal. He resided on the establishment.

107. You do not?—No; I have somewhat similar duties to perform. I have to go to the Academy to see that the masters and pupils attend, and all musical matters are referred to me, subject to the veto of the committee.

108. Does the committee meet often?—Once a week; but frequently in the autumn it is difficult to get the committee together; but when they meet, if I have made any memoranda, they are read over, and the committee either confirm or reject them.

109. Do the committee and the directors have joint meetings?—Sometimes; now and then. When there is business of great importance the whole of the directors are summoned to meet.

110. Latterly, I believe there have been some competitors to the Academy in teaching music?—Yes; the speculations of private individuals.

111. Do you think that may have interfered with the prosperity of the Academy?—Yes, to some extent. One is called the London Academy, where they profess to teach cheaper than the Academy; but the pupils do not get half so much instruction, and they are obliged to take private lessons, as they do in Leipsic. They pay £12 a year. I was speaking this morning to a person who was educated at Leipsic, and I found that the pupils there do not get the amount of lessons that we give them, and they are obliged to get private lessons as well. They have nominally orchestral practice once a week, but they have no teaching in wind instruments, nor even contra-bass.

112. You had a grant of £500 from Parliament last year?—Yes, for the first time.

113. I suppose the effect of that has not yet been much felt?—The effect of it has been that we are within our means now.

114. You appear to have a balance of £200?—Yes, on the last year's expenditure.

115. I see there is a balance in hand from the previous year?—No; it generally averaged that the amount was £500 short.

116. For how long was that?—For many years that was the case. When there were boarders, sometimes the yearly deficit was £1,200.

117. Was your application to Parliament for an annual subvention?—Yes.

118. Is there any reason to think it will be repeated?—It stands in the estimates for the present year.

119. Would you like the amount increased?—Oh, certainly.

120. Do you think you could show good cause why it should be increased?—Yes; it would enable us to assist pupils who have no means at their command.

121. Is not the present contribution of £33 a-year more than the friends of many of the pupils are able to pay with convenience?—Yes. There are some pupils from the country; and though they get an excellent musical education for the sum they pay, they are at the

additional expenso of their living in London under such circumstances, can remain at under an expense of £80 to £100 per annu

122. If the House of Commons were willing the grant so as to enable the Academy to scholarships, should you think that a pro assisting the Academy?—Yes; I should ce

123. And you see no objection to open c the scholarships?—None whatever.

124. Or any objection to the competition widely over the whole country?—Not the l

125. So that each locality might have sharing in a state subsidy of that characte large question, which I am scarcely prepa at present.

126. Have you any mode of competitive at present?—Yes; for the scholarships.

127. Are they much sought after at the?—Oh, yes; for the scholarships vacant la consisting of one male and one female, I ladies competed for the latter.

128. They have to provide for their livi get their education free?—Yes.

129. The competition takes place in Lom

130. What proportion of the pupils are c these scholarships?—I should think about l Generally speaking the pupils of the Ac pretty well the tether or capabilities of their fe

131. Are the pupils of the Academy ever competitions by those outside it?—Yes; some

132. Would it be fair to ask you what i you would suggest in the Royal Academy l increased funds?—The reducing of the co the pupils would be a great advantage.

133. Does not the present amount of the required from the pupils in your opinion remaining at the Academy for so long a p quired to complete their musical education tainly. That is one of our greatest difficultie leave too soon.

134. Do you ever take a fee which cove instruction for a long period?—No; only t term.

135. Should you feel that you exposed tion to any great risk by guaranteeing a struction over two or three years, and taki fee to induce persons to enter for that perio possible to say. One pupil will do more in than another will in three years. I do not ought to remain less than three years.

136. Would it not, in your opinion, be g take a lower proportional fee for three year for each single term?—The fee barely cove education now.

137. Supposing the House of Commons liberal view than at present is the case in a sical education, would you see any objecti creased subsidy taking the form of scholar the United Kingdom?—No; I should be v

138. Government paying the fees?—Ce degrees you may get everybody in.

139. You see no objection to the Govern the fees for three years in advance?—None.

140. You would get a higher class of pu of talent, then?—Yes; probably so. We out better pupils. I have alluded to the c examinations when the Academy first opened. the pupils who went in then turned out there was a choice, but since then we have to take in almost anybody.

141. You consider the pupils have not same mark as formerly?—Perhaps not, on t

142. Because you have not been able t such low terms?—We were not able to pick

143. Are you aware that the state doe towards musical education by requiring tal to teach music?—Yes.

144. Have you ever had any pupils in the Academy from the training schools?—No; I do not think we have.

145. I will now call your attention to question No. 5, issued by the committee, which is as follows:—"Is any union between the Royal Academy and similar schools, cathedral choirs, or local institutions, desirable or otherwise?" In reference to that question it is necessary, perhaps, that I should read this letter, which has been addressed to the dean and chapters:—

"Royal Academy of Music, 4, Tenterden-street,
Hanover-square, London.

"VERY REVEREND SIR,—I am directed by the Committee of the Royal Academy of Music to forward the enclosed particulars of the institution, and to request the favour of your kind attention to one of the objects proposed by its friends and promoters, the cultivation of ecclesiastical music; and, in order to further their views, I have the honour to inform you that a resolution has been passed offering to the deans and chapters of cathedrals in Great Britain and Ireland the musical education, on reduced terms, of any one of their choristers who, on leaving the choir from loss of voice, may be possessed of musical talent and may wish to follow the profession of music, and more especially that branch of it connected with our church service.

"The necessity for a complete musical education for such persons is manifest; and the Royal Academy of Music having now received the assistance of a grant of public money, the committee are desirous of opening the advantages of the institution to every class of musicians, among whom the student of church music is claims of the highest order.

"The usual fees for students are eleven guineas per ann; but the committee have determined that a subscription of 20 guineas per annum shall entitle any dean and chapter to have one pupil in the Academy [who must have been a chorister in their cathedral], who shall remain there as a student for at least two years.

"I have the honour to be,

"Very Reverend Sir,

"Your obedient servant,

"J. GIMSON, Secretary."

146. Have you received any answers to that circular?—Yes.

147. Accepting the proposal?—They have not as yet availed themselves of it by sending any person up, but they have expressed their satisfaction at the nature of the offer made to them. There has not been time to receive many replies.

148. Has it ever occurred to the authorities of the Royal Academy that as the Ecclesiastical Commissioners are interested themselves in appropriating the revenues of cathedrals, they might with propriety be asked to carry out the intentions of our ancestors in promoting the study of ecclesiastical music, and do so through the instrumentality of the Royal Academy by applying some funds at their disposal for that purpose?—I am organist of Hanover Church, Regent-street, and soon after I was appointed I induced the committee of the Royal Academy of Music to require the pupils to sing in the choir there. My object in that was, we had gentlemen who came there to sing whose voices were such that they would turn out anything but Marios. I thought they would get a knowledge of and cultivate music, so as to be capable of taking a position in a cathedral choir. Then our treble sopranos were ladies. Strangely enough the gentlemen never took the same interest in that study, while my best lady-singers soon got engagements at the different churches. It is not a few thought as to the cultivation and study of ecclesiastical music.

149. My question went to this—The Royal Academy of Music is suffering from want of funds. The Royal Academy might promote the study of ecclesiastical music in the whole country by its central action. The Ecclesiastical Commissioners have busied themselves with

ecclesiastical revenues for church purposes; might not, therefore, the Royal Academy of Music ask the Commissioners to give some pecuniary assistance in promoting instruction in ecclesiastical music in the different cathedral towns and churches of the country?—Mr. BOWLEY, a member of the committee observed—The Ecclesiastical Commissioners have obtained the funds of cathedral choirs, therefore the question will be strengthened. They took away a portion of the musical funds, and we may now ask them to give some back.

150. Do you consider the state of cathedral music capable of improvement?—Most certainly. It suffers from the same disease as the Royal Academy—want of funds. In most cathedrals there was sufficient money to support the choirs, but it has been used for other purposes. I was myself a chorister-boy, but received no musical education beyond learning the services and anthems.

151. I have in my hand the copy of another circular issued by the Royal Academy of Music, addressed to the various military bandmasters, or rather the colonels of regiments. May I ask you if you have any connection with Kneller Hall?—No; I believe there was some communication with the late Earl of Westmoreland, but his lordship did not approve of Government interference with the Royal Academy of Music.

152. You had not then arrived at obtaining the £500 grant?—No; not in his lordship's lifetime.

153. The Academy has issued the following circular?—Yes.

"Royal Academy of Music, 4, Tenterden-street,
Hanover-square, 17th May, 1865.

"SIR,—The committee of the Royal Academy of Music have desired me to forward you a prospectus of the institution, stating its objects, &c., &c., and to call your attention particularly to the part respecting band-masters.

"Although, since the establishment of the Academy, the professors of this country have been enabled to hold their ground, and compete honourably and successfully with foreign artists generally, yet it is much to be regretted that, as far as regards military bands in England, they are very inferior to those of France, Germany, and Belgium.

"To remedy this by degrees, the committee have resolved to admit persons wishing to become band-masters on certain conditions, in order that by receiving a sound education they may become fully qualified to accept such appointments.

"It would enable them to arrange music suitably for their various bands and performers, and thus be the means of economising the funds appropriated for the band players.

"The committee have much pleasure in stating that three of the best bands in the service of Her Majesty, viz., the Grenadier, Coldstream, and Fusilier Guards, are presided over by gentlemen who received their education in the Royal Academy of Music.

"Subjoined is a copy of a letter in which you will see that His Royal Highness the Duke of Cambridge, Commander-in-Chief, highly approves of the resolution of the committee of the Academy.

"Any further information you might wish for will be readily given on application to Mr. C. Lucas, the Principal, or to me, the Secretary.

"I have the honour to be,

"Sir, your obedient servant,

"J. GIMSON, Secretary.

"Lt.-Colonel T. Addison."

[Copy]

"Horse Guards, March 21st, 1865.

"SIR,—I am desired by the Duke of Cambridge to acknowledge the receipt of your letter, and the enclosed resolution, which has given his Royal Highness great satisfaction. His Royal Highness considers that the directors of the Royal Academy of Music have conferred a great boon on the performers of wind instruments who

may intend to fill the position of masters in military bands, and which entirely meets with his Royal Highness's approval.

"I have the honour to be

"Your most obedient servant,

(Signed)

"J. MACDONALD.

"Right Hon. Sir G. Clerk, Bart."

154. I understand you to say that the Academy has no connection with the training schools for singing throughout the country?—No, it has not.

155. Have you any library at the Academy?—Yes; but on a very small scale indeed.

156. How many volumes may you have?—We have several volumes of scores of operas and symphonies.

157. I believe there is no great number of works on musical science?—We have very few.

158. Has the Academy any relations with the various musical societies existing in London and elsewhere?—Only in this respect, that the orchestras of the Royal Italian Opera and at Exeter Hall are made up one-fourth perhaps of pupils of the Academy.

159. There are no official relations between you?—No.

160. Do you not think something might be done in the way of promoting the advance of your students by enabling them to be present at the performances of the various musical institutions of the metropolis?—We subscribe to the Philharmonic concerts, and have certain admissions to them.

161. Probably, if the funds permitted, you would subscribe to others with the same view?—Yes.

162. You think advantage would be derived from it?—Certainly.

163. Have you any collection or museum of musical instruments at the Academy?—None whatever, and I am not aware of the existence of any such museum in the country. The best of the kind I know of is that at Edinburgh.

164. That is under Professor Donaldson, I believe?—Yes; we have nothing of the kind. It would be highly valuable and interesting to have a collection of all the musical instruments ever heard or read of. There is an instrument we read of in Milton, when he speaks of "the jocund rebeck's sound." Has any one living ever seen a rebeck?

165. You may see a cast of one at South Kensington, brought from Exeter Cathedral.—I consider there ought to be such a collection in London.

166. You have of course heard of payment by results, as connected with primary education?—Yes.

167. Should you think it advisable to pay by results in musical education? as thus, supposing Parliament decided to give more money to the Academy, that the payment should be conditional on your proving your worthiness to receive it, by the proficiency of your pupils every year?—I think I do not see much objection to that, not to take it universally. In some years we turn out a larger number of good musicians than in others.

168. Do you think it would be acceptable to the Royal Academy that the amount of the Parliamentary grant should be dependent, in some way to be hereafter determined upon, on the successful results of the teaching?—Yes; I have no objection to that myself. If Parliament would interfere with us so much the better.

169. You would not object to a system of inspection?—Not at all.

170. Inspection and examination?—Not at all.

171. You would rather court it than otherwise?—Yes.

172. Do you make any use of the musical library of the British Museum?—We cannot take anything out of it. Some of the students go there to see any work they wish to consult. I have been there myself while Mr. Oliphant was the manager. It is not very available for our students.

173. Of what does a musical library consist, or of what ought it to consist?—For our purposes we want scores and parts of operas, symphonies, &c.

[The Committee adjourned.]

APPENDIX A.

INCOME AND EXPENDITURE OF THE ROYAL ACADEMY OF MUSIC, IN THE YEAR 1864.

APPENDIX B.

PROSPECTUS OF ROYAL ACADEMY OF MUSIC.

The institution known as the Royal Academy of Music is the first successful attempt to establish a national school of music in England. That founded under the same name in 1720 did not pretend to be educational: its object then proposed being only the introduction and support of the Italian Opera, and it ceased as an institution in a few years.

Various other proposals appeared from time to time, but none came to maturity excepting this, which was founded under Royal and distinguished patronage in 1822, incorporated by Royal Charter in 1830, and recognised as well as the Royal Academy of Painting, as a national institution for the cultivation of the fine arts, by a Parliamentary grant in furtherance of its objects.

Being thus established on a permanent basis, and having during the past forty-two years successfully shown by the number of talented professors whom it has sent forth into the world, that the objects for which it was founded are being realised, and that a large amount of good to the art generally has been accomplished, as well as that the individual interests of the members of the musical profession have been materially improved, it is hoped that the Royal Academy of Music will receive liberal support from all who wish to promote, or in any way interested in, the progress of music in this country.

From its commencement to the present time it has educated upwards of 1,300 students, 118 of these gratuitously, and 315 on terms reduced to meet the circumstances of those pupils who showed more than ordinary talent. Among those whom it has educated are some of the most distinguished composers, singers, and instrumental performers of the day; many of them having achieved European reputation.

In order to continue these advantages to the art of music in this country, and if possible to enlarge the sphere of gratuitous instruction, the committee of management earnestly call on all the friends of the Institution, the professors of the different branches of the art, and the musical public generally, to come forward

with that liberal assistance which is indispensably necessary to enable them to carry out their future plans.

The Royal Academy of Music is under the especial Patronage of Her Majesty the Queen, their Royal Highnesses the Prince and Princess of Wales, and His Majesty the King of the Belgians.

The governing body is composed of a President, four Vice-Presidents, and a Board of Directors, from whom are elected a Committee of Management, who, with the Principal, superintend and regulate all the internal economy of the Institution.

The English and foreign professors employed are amongst the most eminent that can be met with in the various departments of instruction.

A resident matron presides over the young ladies' department.

The year is divided into three terms of thirteen weeks each, and the payment by each student is at present eleven guineas per term, with an entrance fee of five guineas. It is, however, proposed to form a junior department for less advanced pupils, who will be admitted into the senior department when fitted for it. The terms of payment for the junior department will be seven guineas per term, with an entrance fee of three guineas; and on their admission into the senior department, the additional two guineas completing the entrance fee is to be paid. Candidates for the junior department must have attained the age of ten years.

The funds for supporting the institution are raised by donations and subscriptions (her Majesty the Queen being an annual subscriber of 100 guineas), an annual Parliamentary grant, and the fees paid by the students.

All candidates for admission must previously pass an examination before the principal and professors appointed for that purpose, to show that they possess musical talent capable of cultivation; and to avoid unnecessary expense and inconvenience to candidates residing in the country, they may be primarily examined by any corresponding member, one at least of whom (a former student of the Royal Academy of Music) will be found in every principal town in the kingdom, and to whom a fee of five shillings will be paid by each candidate; or, in the event of such candidate being a chorister in a cathedral choir, a certificate from the organist will be accepted instead of such primary examination by a corresponding member.

There are two King's scholarships, a Westmorland scholarship, and a Potter exhibition attached to the Institution.

Gratuitous instruction in harmony and musical composition is given to such performers on wind instruments as may occupy, or may wish to occupy, the position of masters of military bands, in order that such persons may more efficiently qualify themselves for their duties therein.

All applications for admission to be made to the Secretary, at the Royal Academy of Music, Tenterden-street, Hanover-square, London, W.

Regulations.

1. All orders whatever for the government and regulation of the Academy emanate from the committee, whose orders are delivered, through their chairman, to the different officers of the establishment.

2. All branches of music are taught in the Academy. Should the particular branch for which the students enter be harmony, singing, harp, or pianoforte, the male students will be required to learn, in addition, any orchestral instrument the committee may require.

3. There are three terms in the year, Lent, Easter, and Michaelmas; with a vacation of four weeks at Christmas, a week at Easter, and a long vacation of eight weeks in summer. The payments are to be made in advance.

Student's Payments.—Senior department, 33 guineas per annum, or 11 guineas a term.

Entrance fee, 5 guineas.

Junior department, 21 guineas per annum, or 7 guineas a term.

Entrance fee, 3 guineas.

One term's written notice must be given when a pupil is to be withdrawn, or a term's extra payment will be required.

4. Students will be admitted at the commencement of each term. Candidates for admission must attend for examination by the board of examiners on some day in the previous week to be duly advertised, and with a recommendation from a subscriber, honorary member, member, or an associate.

5. The students will be required to pay implicit obedience to all persons placed in authority over them, and to attend punctually the hours appointed for their instruction, and at all orchestral practices, rehearsals, and performances; they are also required to be present during the entire time of attendance of their various classes.

6. All students will be especially required to attend the orchestral and sight singing practices on Tuesdays and Fridays.

7. All students will be required to learn harmony and the pianoforte.

8. Advanced students will be required to give instruction in the Academy.

9. No student will be allowed to undertake any public or private engagement, without first obtaining the sanction in writing of the committee recommended by the principal, and signed by him and also the chairman, and dated when granted.

10. No student shall publish any composition without the sanction of the committee; and a copy of all compositions so published must be presented to the library of the Academy.

11. On leaving the Academy, the students admitted under the above regulations must undergo an examination. Should the examination prove satisfactory, they will receive a diploma, and, in special cases, the additional distinction of being appointed an Associate of the Institution.

12. Any infringement or violation of the regulations, or any discreditable or improper conduct, will subject the student, at the discretion of the committee, to be dismissed from the Institution; or an associate, to the erasure of his or her name from the register.

The above regulations are appointed by the committee and directors, acting under the charter given by his late Most Gracious Majesty, King George IV.

Signed, GEORGE CLERK,
Chairman of the Committee of Management.

APPENDIX C.

ARRANGEMENTS OF CLASSES AND THE PROFESSORS' ATTENDANCE FOR EASTER TERM, 1865.

MONDAY AND THURSDAY.

GOVERNMENT ROOM.

Signor Arditi.—Singing Class, 10 to 12.—Brougham, Cooper, Willis, Wynne.

Mr. Lucas.—Harmony, 2 to 3.—Buer, Cronin, Harriott, Williams.

CONCERT ROOM.

Mr. W. Macfarren.—Pianoforte, 9 to 10.—Bambridge (1 lesson), Kemp; 10 to 11:30.—Buer, Harriott, Williams; 11:30 to 1.—Eales, Tylee, McDonald.

Herr Pauer.—Pianoforte, 1 to 2.—Henry.

Mr. Holmes.—Pianoforte, 2 to 4.—Chatterton, Merriman, Vaughan, Vokins.

K. ROOM.

Signor Garcia.—Singing, 10 to 11.—McCandlish, Horton.

Mrs. Netherclift.—Singing, 1 to 2.—Buer, Harriott, Williams; 2 to 4.—Kinkel, Piedra, S. Pitt, M. Pitt, Whyte.

I. ROOM.

Miss Whyte.—Singing, 10 to 11.—Eales, Tylee, Townsend; 11 to 12.—Henry, Lazarus, Odell; 12 to 2.—Chatterton, Merriman, Vokins, Vaughan, Sharpe.

Mr. H. Thomas.—Pianoforte, 2 to 4—Brougham, Cooper, Wynne, Watts, Willis, Horton, Townsend.

J. ROOM.

Miss Zimmermann.—Pianoforte, 10 to 11:30—S. Pitt, M. Pitt, McCandlish.

Mr. Lunn.—Harmony, 12 to 2—Brougham, Cooper, Wynne, Sharpe, Vaughan, Whyte.

Mr. Westlake.—Pianoforte, 2 to 4—Lazarus, Odell, Sharpe, Whyte.

COMMITTEE ROOM.

Herr Goldschmidt.—Pianoforte, 12 to 3—Hall, Jarrott, Thouless, Kinkel, Kingdon, Piedra.

B. ROOM.

Mr. W. Wells.—Singing, 11:30 to 12—Bell.

Mr. Holmes.—Pianoforte, 12:30 to 2—Bell, Johnson, Heywood.

C. ROOM.

Mr. Westlake.—Pianoforte, 1 to 2—Ralph, Rich.

TUESDAY AND FRIDAY.

CONCERT ROOM.

Sight Singing Class for all the Students, 1 to 2; Orchestral and Choral Practice, 2 to 4, for all the students, under the superintendence of Mr. Lucas.

Mr. Lacy.—Elocution, 10 to 1—Haines, Isaacs, McCandlish, McDonald, M. Pitt, Willis, Wynne, Bauermeister, Bradshaw, Brougham, Chadwick, Cooper, Forsyth, Greenaway.

Gentlemen's Class.—Wells, D. Smith.

K. ROOM.

Signor Maggioni.—Italian Language, 10 to 12—Bauermeister, Bradshaw, Brougham, Chadwick, Cooper, Forsyth, Greenaway, Haines, Isaacs, McDonald, Wynne, McCandlish, S. Pitt, Willis.

I. ROOM.

Dr. Steggall.—Harmony, 10 to 12—Chatterton, Eales, Gibbons, Lazarus, Merriman, Odell, S. Pitt, M. Pitt, Severn.

J. ROOM.

Mr. Bannister.—Harmony, 11 to 1—Chatfield, Hendry, Piedra, Tylee, Kemp, Pettitt, Smith.

COMMITTEE ROOM.

Mr. G. Macfarren.—Harmony, 10 to 12:30—Bambridge, Bell, Elliott, J. Jackson, Thouless, Kinkel, Kingdon, Johnson, McDonald.

B. ROOM.

Mr. Goos.—Harmony 12 to 1—Hull, Ralph, Snewing, J. Jackson.

Mr. Horton.—Oboe, 11 to 12—J. Jackson.

C. ROOM.

Mr. Folkes.—Violin, 11 to 1—Elliott, Mountain, Clement, Couldry, Kemp.

Mr. Turner.—Harmony, 9:30 to 10:30—Mountain, Rich, Heywood, Couldry.

A. ROOM.

Signor Maggioni.—Italian Language—Gentlemen's Class, 9:30 to 10—Hamilton, Wells, Smith.

Mr. Aylward.—Violoncello, 12 to 1—Bambridge.

Mr. Lazarus.—Clarinet, 11 to 12—Hallett.

G. ROOM.

Mr. Watson.—Violin, 9 to 11:30—Bell, Dewberry [viola], Heywood, Johnson, Junatt, Pettit [viola], Thouless [viola].

WEDNESDAY AND SATURDAY.

CONCERT ROOM.

Mr. Dorrell.—Pianoforte, 9 to 12—Elliott, Fox, Mountain, Gibbons, Severn, Bryant.

Mr. Cusins.—Pianoforte, 2 to 4:30—Bauermeister, Martin, Dewberry, Jackson, Couldry.

K. ROOM.

Mr. O'Leary.—Pianoforte, 9:30 to 12—Chatfield, Johnson, Isaacs, Forsyth, Chadwick, Wells, Clement.

Mrs. O'Leary.—Singing, 12 to 1:30—Bryant, Martin, Chatfield, Johnson, Severn.

I. ROOM.

Miss Gimson.—Pianoforte, 2 to 3—Greenaway, Bradshaw.

J. ROOM.

Mr. Banister.—Harmony, 12 to 2—Greenaway, Martin, Bradshaw, Bryant.

Mr. Banister.—Wednesday—Bauermeister, Chadwick, Forsyth, Isaacs, Bradshaw.

Mr. Banister.—Saturday—Greenaway, Martin, Bryant.

COMMITTEE ROOM.

Signor Schira.—Singing, 10 to 3—Bauermeister, Greenaway, Haines, McDonald, Chadwick, Forsyth, Isaacs, Bradshaw, Hamilton, C. Harper, H. Harper, Wells, Smith.

B. ROOM.

Dr. Steggall.—Organ, Wednesday, 9 to 12:30—Kingdon, Gibbons, Bambridge, Eyles, Fox, Pettit, Thomas.

Mr. Eyles.—Pianoforte, 1 to 2:30—Smith, J. James, Pettit.

C. ROOM.

Mr. Mason.—Pianoforte, 11 to 12—Snewing, Hallett.

A. ROOM.

Mr. Sainton.—Violin, 11 to 11:30—Ralph, Snewing, Jackson.

G. ROOM.

Mr. Lucas.—Harmony, 12 to 1—Couldry, Dewberry, Fox, Jackson.

Mr. Radclif.—Saturday, Flute, 2 to 3—Rich.

The tuition given to each student per week is as follows:—

Ladies.—If the principal study be the pianoforte, the student has two lessons of half-hour each on that instrument. Second study—two lessons in singing of twenty minutes each. Harmony—two lessons in classes of four to the hour. All students are obliged to attend the singing class and the orchestral and choral practices twice a week. If the principal study be singing, the student has two lessons of half-hour each. Second study, pianoforte—one lesson of half-hour. Harmony—one lesson in classes of four to the hour. Italian language—two lessons in classes of six to the hour. Sight singing and orchestral and choral practices as above.

Gentlemen.—If the principal study be violin, or any other orchestral instrument, two lessons of half-hour each. Second study, pianoforte—two lessons of twenty minutes each. Harmony—two lessons in classes of four to the hour. Sight-singing and orchestral practices. If the principal study be pianoforte, two lessons as above, and second study some orchestral instrument. Harmony as above. Sight-singing and orchestral practices. If the study be singing, the same course is adopted as before mentioned. Although each student only receives individual tuition, as stated above, all the students are required to attend their masters in classes of four and remain during the whole time of each class, consequently they have the advantage of hearing the remarks made to others. Some students, in addition to the above, receive lessons on the organ. All have the use of the music contained in the library of the Academy.

Proceedings of Institutions.

ALTON MECHANICS' INSTITUTION.—The twenty-seventh annual report says:—The committee have reason to believe, that notwithstanding they have to acknowledge a falling off in the number of members, the Institution continues in a healthy working condition. Of quarter members there are 14 less than last year, and 33 less than the year before. There has been an addition made to

the library of 48 volumes, bringing the total number up to 1,671, and besides these, 19 new volumes have been purchased to replace old ones which have been entirely worn out in the service. The issues of books for the year have been 2,559, or on an average about 49 per week. The lectures were 15 in number, and amongst them may be mentioned:—One on "Mahommed, his Words and Works," by W. Dowling, Esq., of the Inner Temple; one on "The Importance of an Acquaintance with Elementary Science," by J. C. Buckmaster, Esq., from the Science and Art Department; two on "Milton, his early Life, Times, and Poetry," by the Rev. J. T. Plummer; one on "Fishes, Fossil, and Recent," by Waterhouse Hawkins, Esq.; one on "The Life Boat, and her Works of Mercy," by the Rev. N. H. McGachen; one on "The Romance of the Bourbon Family," by Dr. J. C. Daniel; and one on "Adam Bede," by G. Groosmith, Esq. The number of subscribers amounts to 226, viz.:—Annual subscribers of 10s., 45; ditto of 1 guinea, 52; quarterly subscribers, 106; ditto who have paid part of the year and have left, 30. The statement of accounts shows that the expenditure has amounted to £155 Os. 5d., and that there is a balance due to the secretary of £18 15s. 5d.

PENBROKE-DOCK MECHANICS' INSTITUTE.—The fourteenth annual report says that in the condition of the Institute there is a steady improvement. The total number of members was 285, showing an increase of 13 during the twelve months. The library for circulation consisted of 2,090 volumes—101 of which had been added during the year. Upwards of 60 members have, since 1862, kindly volunteered an annual subscription of two shillings, in addition to their regular subscription, amounting to £162s. 6d., to be devoted entirely to the building fund. In reference to the annual examination by the Society of Arts, the Committee feel much pleasure in testifying to the increasing interest taken by the members in these educational tests; and, if an educational scheme, in connection with the Institute, were properly developed, a still further increase in the number of candidates would ensue. The balance sheet shows that the income was £118 5s. 6½d., and that there was a balance in hand of £9 13s. 1d.

REDDITCH LITERARY AND SCIENTIFIC INSTITUTE.—In the last report the abstract of accounts shows a balance due to the treasurer; but the money has been expended specially in the library department, for requirements not likely to occur again. The lectures have produced a profit, instead of a heavy loss, as in the previous year's account. The library has been increased, thoroughly re-arranged, and the books repaired, covered, and newly numbered; also new catalogues have been printed. The total number of volumes is now 1,074. The issues this year have been only 1,632, a decrease accounted for by the library having been closed about ten weeks, in consequence of the re-arrangement. The Working Men's Branch is progressing most satisfactorily; the newspapers and magazines supplied to that department have been increased. The Saturday evening entertainments have either increased than diminished in popularity and in popularity. A very successful effort has been made in a new direction—the establishment of science classes. In the first session 13 pupils (out of 14 candidates) passed a government examination; and about three times that number have attained such a stage on the road to scientific knowledge as will most probably lead them on to further efforts. The expenditure has amounted to £139 1s. 3d.

EXAMINATION PAPERS 1865.

(Continued from page 562.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

ELECTRICITY AND MAGNETISM.

THREE HOURS ALLOWED.

1. Describe the best construction of a mariner's compass. How are the needles best arranged, and why?
2. How have the diurnal changes in the earth's magnetism been accounted for?
3. Explain experimentally the phenomena of diamagnetism.
4. State the theory of electricity which you consider most in accordance with the present state of knowledge, and mention some experimental illustrations.
5. Distinguish between an electrometer and an electro-scope, and describe the condensing electro-scope.
6. Explain the conditions of efficiency in a lightning conductor.
7. In what respects does the electricity evolved from a machine differ in quality from that of a battery, and how may they be shown to be identical?
8. What is a so-called astatic needle, and what position will it assume when the two needles are exactly equal in force?
9. Explain the construction and use of a tangent-galvanometer.
10. Explain the cause of the rotation of a current round a magnet, or *vice versa*.
11. Describe the construction of any magneto-electric telegraph.
12. Explain the construction of a submarine cable, and the method of testing its insulation.
13. How is an induction-coil machine constructed, and by what special apparatus may the shocks be intensified?
14. Explain the process of electroplating.
15. By what means can the current be most economically produced for electro-metallurgy on the large scale?
16. What phenomena result from the transmission of a current through a living compound nerve?
17. What electric phenomena are manifested by portions of nerve and muscle of a recently killed animal?
18. What is the peculiar character of thermo-electric currents, and by what means can they be most readily produced?

LIGHT AND HEAT.

THREE HOURS ALLOWED.

GEOMETRICAL OPTICS.

1. Give the definitions of a beam of light, a ray of light, and a pencil of rays. Trace the visual pencil, or the pencil of rays by which the image is seen, when an eye in a given position sees the image of an object which is formed by a *plane mirror*; showing the form and position of the image from the law of the reflection of light, and stating whether the image which is seen is real or virtual.
2. Show how the image of an object is formed by a *concave* spherical mirror, both when the object is near the mirror and when it is distant. Show that the image of an object formed by a *concave* mirror is sometimes real and sometimes virtual, and show the circumstances in each case. Show how a combination of a concave mirror, a plane mirror, and an eye-lens constitute the Newtonian telescope, and show how the magnifying power is found.
3. Show how the *refraction* of light at a *convex* spherical surface of a dense refracting medium forms an image of a distant object within the medium. Apply this discussion to explain the formation of an image upon the retina of the eye, supposed in the first instance to be of a homogeneous structure. What discussions have arisen to explain why we see objects erect, when the image formed upon the retina is inverted?
4. Explain what is meant by an *achromatic* lens; and show how the achromatism is produced. State the advantages possessed by achromatic telescopes and microscopes over the simple forms of these instruments.

PHYSICAL OPTICS.

5. Explain what is meant by a beam of *plane polarized* light, and show the various methods by which such beams can be obtained. Explain the modes of testing the polarization. What is the state of the polarization of the two rays, which, originating in a ray of common light, have traversed a double refracting crystal?

6. Explain what is meant by the colours of *thin plates*, and show how the colours of the soap bubble, and of *thin films* of refracting substances generally, are explained on the doctrine of the interference of light. Describe some cases which occur in common experience where such an explanation will apply.

7. Describe the appearances seen when we place *a hair of the head* before the pupil of the eye, and look towards a distant lighted candle; these appearances being more distinct when we look through a pin-hole in a card, or a narrow slit parallel to the hair. Give the explanation of the phenomena which are seen.

8. Show the arrangements which are necessary in the polarizing microscope, and state how the phenomena which are seen in the field of view arise. Give some examples of objects which are proper for the polarizing microscope.

HEAT.

9. Give the distinction between the *temperature* and the *latent heat* of a body. If steam, and the water from which it arises, are of the same temperature, explain what amount of heat (or, better, of caloric as the cause of heat) has been required to change the water into steam. When the steam is condensed into water again, what amount of heat does it give out?

10. Describe the construction and graduation of the common *mercurial* thermometer; and show how to compare the different scales of degrees which have been used. When the temperature is 80° in England, what would it be called in France?

11. State the ordinary law of the *increase of volume* of the gases under constant pressure for increase of temperature. Does the same law apply to super-heated steam when removed from contact of the water from which it is produced; and to the vapours of the liquids generally, in similar circumstances?

12. Explain the *principle* of the construction of the double-acting condensing steam engine; and show how the communicating and abstracting of heat produces the mechanical force which is developed.

CHEMISTRY.

THREE HOURS ALLOWED.

No candidate is allowed to answer more than three questions in each division.

FIRST DIVISION.

1. 100 cubic centimetres of air ($6 \cdot 10371$ cubic inches) are mixed with 50 cubic centimetres of hydrogen at 15°C . What will be the volume of the residual mixture after explosion, at the same temperature and pressure?

2. Describe the construction and working of an apparatus for the preparation of pure and dry hydrogen. Explain by symbols the chemical changes which occur in the process.

3. How is ammonia obtained from crude coal gas? Describe and explain the chief reactions of ammonia.

4. How is marsh-gas obtained in a state of purity? How much heavier is it than hydrogen? How can you distinguish and separate it from olefiant gas?

5. Describe and explain the action of chlorine on a concentrated solution of potassic carbonate, also its action on slaked lime.

6. How would you prepare pure silica from an insoluble silicate such as felspar?

SECOND DIVISION.

1. An alloy of antimony and lead is given. How would you prepare pure metallic antimony from it?

2. A sample of copper is suspected to contain arsenic. How would you proceed in order to decide whether arsenic is contained in it?

3. Describe the action of sulphuretted hydrogen on aqueous solutions of the following compounds separately, viz., antimonious acid, corrosive sublimate, chromic acid, ferric chloride, *susquichloride* of iron, supposing that each of the solutions contains free hydrochloric acid. Explain the action in each case by an equation.

4. Explain the manufacture of white lead.

5. How is aluminium prepared? What alloy of aluminium is chiefly made?

6. How is caustic potash usually prepared? What are its chief impurities? How can the alkali be obtained pure?

THIRD DIVISION.

1. How is vinegar usually made? how purified? Describe the compounds of acetic acid and lead, giving their formula.

2. Describe and explain the process of etherification, giving the formula of the substances which take part in it.

3. What decomposition does benzoate of lime undergo when subjected to dry distillation? What is the decomposition when it is distilled with hydrate of lime?

4. How can pure uric acid be obtained from guano?

5. How would you test for cane sugar in the sap of a plant?

6. Describe the formation and properties of some compounds of metals with alcohol radicals, and show in what manner their constitution decides the atomic weights of the metals contained in them.

(To be continued.)

PARIS UNIVERSAL EXHIBITION OF 1867.

The Emperor has just issued the decree approving the decisions of the Imperial Commission relative to this great exhibition, which is to include Art, Agriculture and Industry.

It is decided that it shall take place in the Champ de Mars, in a temporary building, surrounded by a park, destined to receive living animals and plants as well as objects too large or unfit for exhibition within the building. The exhibition is to open on the first day of April and to close on the last day of October, thus extending its duration to seven months. Some of the regulations are of a novel character and deserve notice. In the first place a committee is to be appointed immediately, to make the exhibition, its objects, and regulations known thoroughly throughout the provinces of the empire; to make out, by the end of October in the present year, a list of the principal artists, agriculturists and manufacturers whose work will be valuable to the exhibition; to induce preliminary local exhibitions of agricultural products in each department; to form a commission composed of scientific men, agriculturists, manufacturers, foremen and other persons to study these exhibitions and report on the use which may be made of the information thus obtained; to arrange for the collection of funds for aiding the working classes in visiting the exhibition, and for the publication of the reports mentioned above.

It is announced that the official catalogue will be composed of two portions, to be arranged alphabetically, one part in the order of exhibitors names, the other that of objects, and on this account the materials for the catalogue, foreign as well as French, are to be supplied by the end of the present year.

The classification differs considerably from that of former exhibitions, and is divided into ten groups and ninety-five classes. The first group comprises the fine arts. The second group consists of the materials and applications of the liberal arts:—Printing, stationery, industrial art, photography, music, medical, mathematical, and scientific instruments, maps, geographical and educational apparatus. The third group includes furniture, linen, &c.

paper hangings, plaster and other ornaments, glass, porcelain, carpets, cutlery, goldsmiths' work, bronze, clocks and watches, apparatus for lighting and heating, perfumery, and small wares. The fourth group comprehends all objects of personal wear and decoration, including tissues, cotton, linen, woollen, and silk shawls, lace, hosiery, jewellery and other ornaments, arms, travelling equipments and toys. The fifth group includes mining and mineralogy, iron and steel wares, forest produce, animals, implements, and produce of the chase and fisheries, and of uncultivated lands, agricultural, chemical, and pharmaceutical productions, materials for, and products of, dyeing and printing, dressed furs and skins. The sixth group is to consist of instruments and processes of ordinary art, metallic, rural, agricultural, alimentary, chemical, &c., motive and other machinery, and tools of all kinds, carriages and carriage making, saddlery, railway and telegraphic plant, instruments and processes, civil engineering and public works, and maritime matters. Group the seventh takes in alimentary substances, fresh or preserved condiments and other stimulants, wine and other drinks. The eighth group includes living products, and the material of agriculture, useful insects, fish, &c. The ninth is devoted to horticultural products and materials of all kinds. The tenth and last group is to consist of objects exhibited with special reference to the material and moral welfare of the great mass of the population, and is to include matters connected with education, habitation, clothing and food, and amongst other things a collection of the costumes of all nations, with special reference to climate, profession, economy, and health, and an exhibition of the tools, processes and products of working men, who carry on their business with the aid only of their own family or of an apprentice, in relation with the objects of this group.

It will be observed that the classification does not comprise military and naval armaments; and, it may be added, that the commissioners express a desire to make any such alterations in their programme generally as may hereafter seem desirable, and, in fact, invite suggestions on that head.

As regards works of art, only those produced since the 1st of January, 1855, are admissible.

All objects are to be exhibited under the name of the producer, but the name of a regular agent may be added by permission of the exhibitor. Merchants and others will, however, be permitted, by special order, to exhibit products not shown by their manufacturers.

Cash prices may be affixed to the articles, and in the case of the economic furniture and clothing class, this is obligatory.

Each exhibitor will have the right to a card of admission to the exhibition, and recognised agents will be placed on the same footing.

The rates of admission, and what medals or other prizes are to be awarded, will be announced hereafter.

A scientific commission, to report, in concert with theuries, on the various classes of the exhibition; the delivery of lectures, for which a theatre is to be provided at hand; and classes for study, form part of the scheme.

To avoid delay and incompleteness at the time of the opening of the exhibition, the Imperial Commission has adopted a system differing in several respects from those which have hitherto prevailed. These changes will be indicated by the following extracts from one of the schedules attached to the report:—Notification of the amount of space to be allotted to foreign states is to be given before the fifteenth of next month. The outline plans of each foreign commission to be sent in before the end of October, and all the details before the end of January, 1866. The building and park to be finished by the 1st of December next year. All the stalls and fittings of exhibitors to be finished by the middle of January, 1867. All goods to be delivered within the exhibition building between the 15th of January and the 10th of March.

Everything to be in its place by the 28th of March; the two following days to be devoted to a thorough cleansing and brushing up of the whole exhibition; and the last day of March to a complete official review of the whole.

It will be perceived that two points which have been already much discussed are left untouched in the report, namely, the proposed arrangement of the exhibition in such a manner as to present both a geographical and a systematic classification; and the entire avoidance of galleries, and consequently of staircases.

Fine Arts.

FINE ART EXHIBITIONS IN THE FRENCH PROVINCES.—The growth of provincial exhibitions of works of art in France is one of the most remarkable facts of the day and shows how the love of the beautiful is spread over the whole country. Almost every week brings the announcement of a new one. Amongst those which have taken place, or are arranged for the current half-year, are those of Alençon, Bordeaux, Marseilles, Lyons, Nantes, Nîmes, Niort, Spa, Toulouse and Versailles. As these provincial exhibitions are held at various seasons—that of Lyons, one of the most important, opens in the latter part of December or the beginning of January—artists are able to send their works to two or three in the same year. To give an idea of the pecuniary effect of these provincial exhibitions with respect to artists, it may be mentioned that during the late exhibition at Bordeaux the purchases reached £2,639 in amount. The authorities of the town expended £256 for two pictures and three bronzes for their museum; the Society of the Friends of Art, by which the exhibition is managed, £880; and private individuals £1,500. Many of the works purchased, which numbered more than a hundred, were by Parisian artists, or artists well known in the Paris world of art, such as Antigna, Barye, Bliu, Brown, Mene, Rousseau, Boulangé, Chaplin, Corot, Fromentin and Landelle; but still more were by artists yet but little known beyond the provinces. To them these provincial exhibitions are of immense service, not only for the sale and exhibition of their own works, but on account of the opportunity they afford of seeing them exhibited side by side with those of artists of acknowledged standing and celebrity.

NEW PROCESS OF PICTURE CLEANING.—The *Pall-mall Gazette* says:—Oil pictures of ancient date become clouded by dust deposit; this can be wiped off. They also are obscured by an opacity in the varnish surface; this can be scraped away, but rarely without serious detriment to the picture. Too many flayed and glaring wrecks of what were once noble efforts of pictorial art exist to warn the artist covetous of immortality; but Professor Pettenkofer's process gives us hope that their numbers need not be increased—that the picture-cleaner's noxious vocation will soon be superseded. Science has disclosed the true means of restoration. The opacity of the varnish arises from a molecular change; the resinous particles of which it is composed becomes displaced in course of time, and when so displaced their transparent quality is lost. These atoms, once restored to their original cohesion, recover lucidity; and this can be effected by exposing the surface of the picture to the fumes of alcohol. The spirit, when absorbed, evaporates; the varnish coating has received new life, and is left as hard as it was before—perhaps harder. The hand of man throughout the operation has never approached the surface of the picture. Professor Pettenkofer has patented this application of alcohol, and the apparatus by which it is effected, but with great liberality he placed it freely at the disposal of the authorities of the National Gallery. After preliminary experiments, it has been tried with complete success, under Mr. Wornum's personal superintendence, on sixteen of the pictures in the public collection. "With such results," our authorities consider it "but just to the liberal and

scientific inventor to express a favourable opinion as to the utility of the process;" though they have no better means of advertising their opinion of its merits than an unread appendix to this year's estimates.

Manufactures.

CHINA GRASS.—The regular introduction of this fibre into manufacture is being steadily pursued in France. In the *Journal* of the last week of 1864, page 110, will be found an account of the experiments recorded up to that time. The subject has now been pushed some steps further, and the new results, although apparently highly satisfactory, exhibit modifications of former statements well deserving the attention of the manufacturing world. M. Ch. Legheer, cotton spinner, of Laval, has produced eight pieces of coutil, white and dyed of various colours, for trousers, which are pronounced excellent, the stuff being peculiarly silky, and the colours fresh and pure. These tissues are composed of mixtures of jumel cotton and China grass in the proportions of 50 per cent. of the latter fibre in the warp, and 60 per cent. in the weft. M. Legheer has recorded the results which he has obtained in a letter, of which the following extract contains the principal points. He declares that there is scarcely any waste whatever in the working of the China grass; that it works perfectly with the ordinary cotton spinning machinery; that it may be advantageously used as a substitute for cotton to the extent of from 60 per cent. to 75 per cent., and that the beauty and regularity of the tissue are most remarkable. The weaver who produced the specimens alluded to has offered to take all the China grass yarn that M. Legheer can produce for the next six months, to the extent of a ton a day, and M. Legheer, on his part, expresses his readiness to take a very large quantity, and to devote himself entirely to the spinning of it. As regards the cottonization, to use the expression of the writer, it is performed perfectly well by the ordinary carding machinery (*batteurs-cardeurs*), at the rate of from three to four hundred pounds per day. Moreover, M. Legheer says that when he can secure a good supply of the China grass he is convinced he can spin it without any mixture of cotton whatever, and produce yarns which will leave nothing to be desired. He does not, however, regard the fibre as a complete substitute for cotton, but believes it might advantageously replace the latter to the extent of from 60 to 75 per cent. Now comes the great question of cost and economy. The following are the results made known to the public. The expenses of working, dyeing, and bleaching cotton grass cloth, are said to be the same as for the same kind of fabrics composed of flax or cotton. As regards the material itself, it is said that while a tissue of pure cotton costs about 6*fr.* 07½ per kilogramme, one composed of half cotton and half China grass comes to 4*fr.* 72½, and a tissue composed of the latter fibre alone would only cost 3*fr.* 25 per kil. It is here observed, however, that the China grass at present employed is heavier than the cotton, but Messieurs Mallard and Bonneau, who supplied M. Legheer with the material, state that by carrying the operation of preparing the fibre a little further, they can produce it of the same lightness as cotton. But the question naturally arises whether such improvement in the preparation will not seriously alter the figures of the above estimate. The Chamber of Commerce of Rouen has pronounced most favourably on the fabrics composed of the mixed fibres, and all the world is acquainted with the fine tissues which have been produced, but nothing but practical experience on a large scale will settle the economic problem. M. Legheer's confident assertion respecting the absence, or almost entire absence, of any waste in working the China grass, is certainly a point of great importance, and is estimated as giving it an advantage, under this head, ranging

in value from 10 to 25 per cent., as compared with cotton of different kinds. M. Paul Dalloz, in commenting on these reports in the *Moniteur*, says, with reference to the absence of waste:—"And we had already counted on this waste for the manufacture of paper! Will China grass rob us of this hope? If so we beg Messieurs Mallard and Bonneau to try their methods of preparation on some other plant, the commonest in our fields, ferns for instance, and furnish our paper mills with the raw material, which shall deliver us from the paper loaded with duty, with which the printing office has been so long afflicted." M. Dalloz's appeal will produce a crop of sympathy in all the printing offices in the world, and perhaps eventually the gentlemen he appeals to, or some one else may supply the desired raw material, but it is not found yet. However, every little helps, and possibly repeated demands may have some effect. The Senate recently received a petition on the subject from seventy-nine paper makers, which was reported upon by M. Le Roy de Saint Arnaud, and referred to the Minister of Agriculture and Commerce. Promising as are the reports concerning the utility of China grass, not only for light gauzy articles, but for the production of solid tissues for ordinary wear, the grand problem of a good supply of the raw material remains, unfortunately, at present unsolved. Possibly the necessary supply may be obtained from India and China, in which case there is nothing more to be said, except indeed it can be produced nearer home more, or even as economically. Algeria offers one of the best chances of a supply of the fibre, and the Emperor paid considerable attention to the subject during his recent visit to his African dominions, and it is said that experiments made near Paris prove that the plant could be easily acclimatized in France. With the view of testing the questions both of production and manufacture, a society, composed of some of the most influential persons in the cotton trade, and in connection with a banking firm of high standing, has, it is said, been formed, which will supply capital to agriculturists for the special purpose in view, and also establish a factory near Rouen for the preparation of the fibre. There is no doubt that the matter is one of great importance, and it will be of great service to commerce and manufactures if the efforts of the company should be crowned with success.

EXHIBITION OF INDUSTRIAL ART.—The preparations for the Exhibition of Industrial Art, which is to open on the 10th of August this year in the Palais de l'Industrie in the Champs Elysées, under the management of the "Union Centrale des Beaux Arts appliqués à l'Industrie," whose establishment in the Place Royale has been noticed in the *Journal*, promise good results. The applications for space are very numerous, and there is no doubt that it will be by far the best exhibition of the kind that has been held in Paris. As already stated, it will include not only contemporary but retrospective art, and the contributions of collectors towards the latter promise to render it highly interesting. The plan adopted is to confine the works of the present day to the ground floor, and those of the past to the galleries. With the view of rendering the connection between the two floors more easy, a grand staircase is now in course of construction which will give direct access to the galleries from the centre of the nave, and thus, as it were, invite the public upstairs, and save visitors a search for the staircases, which at present are hidden in the angles of the building. This matter was well worth the attention of the managers, who have therein shown an enlightened regard to the value of easy and evident modes of ascent and descent. The Palais de l'Industrie is unfortunately constructed; the galleries are very wide in proportion to the building, and consequently a very large portion of the lower floor is ill-lighted. The new exhibition building to be used in 1867, is to be entirely without galleries, and there is no doubt that the convenience and general aspect of the exhibition will be immensely improved by their absence.

Colonies.

The following is a summary of the latest Australian intelligence, as given in the Messrs. Silver and Co.'s Emigration Circular, just published:—

VICTORIA.—Population on 31st March, 610,250, showing increase of 5,192 on first quarter of the year. Land occupied on 31st March, 6,064,963 acres, first selection made under the new Act. Colonial defence, water supply, and mining bills before Parliament. Establishment of a branch of the Royal Mint proposed. Abundant rain since active operations on gold fields and agricultural lands. A 70oz. gold nugget found at Bendigo. An explosive compound—said to have advantages over gunpowder—patented. Slate, fit for roofing purposes, discovered at Castlemaine. Competent female servants much in request.—May, 1865.

NEW SOUTH WALES.—Seasonable rains for agricultural operations, causing abundance of pasture, and favourable reports from most of the country districts. £40,000 voted for emigration, and £2,500 for sinking wells on the Darling and Lachlan. Another oil-yielding mineral discovered at New Hartley.—May, 1865.

SOUTH AUSTRALIA.—Colony in highly prosperous state. Revenue for quarter ending 31st March, £213,848; very large surplus in land. The question of making Adelaide free port under consideration. Excess of immigration, over emigration, since commencement of the year, 1,341, as immigrants still very much wanted; large votes being passed and Government desirous of having two ship-loads a month. Copious rains making farmers very busy. Several new hundreds declared, and surveying rapidly progressing. New road bill prepared. Railways on lease submitted for tenders. The central part of colony to be called Alexandria Land.—May, 1865.

QUEENSLAND.—Mail service *via* Torres Straits asked for. Large cotton yield expected; picking commenced. Restrictions on importation of stock about to be removed.—May, 1865.

NEW ZEALAND.—Wanganui campaign closed. Wellington exports for quarter ending March 31st, £111,702; imports, £58,029. Trade improving, many buildings in course of erection, and general prospects have a promising aspect in Wellington. Land for sale in the northern provinces, being surveyed. Okitiki digging yielding largely; new mines discovered. Railway proposed from Nelson to Blenheim.—May, 1865.

SALMON IN TASMANIA.—It has been stated that although 600 of the ova placed in the ponds in the River Plenty were successfully hatched into living fish, they have since been reduced to below 500, owing to mortality and the destruction by water rats, so that the great salmon acclimatization experiment is not now so cheering as it was at first considered.

Notes.

FISHING BY THE ELECTRIC LIGHT.—The *Courrier de l'éclairage*, a paper published at Lorient, gives an account of an experiment made recently at Belle-Isle to fish at night by means of electric light. The light was produced by a powerful electro-magnetic machine, constructed by M. Bazin, the well-known engineer. The experiment, which was conducted by M. Bazin on board the *Andalous*, the presence of 1,500 persons assembled on the pier, was completely successful, and the quantity of fish taken very large. As soon as the submarine lantern was immersed, shoals of fish of every kind came to sport in the illuminated circle, while the fishermen outside it spread their nets from their boats. The light illuminating the deep sea, the fish arriving in shoals, attracted by the titillating sun, the boats at the edge of the lighted circle,

the deep silence, interrupted only by the working of the electro-magnetic machine, is described as an imposing sight. It is said that M. Bazin is shortly to proceed to Bona, in Algeria, to establish a coral fishery by the assistance of his electric light. He proposes in the meantime to descend 400 feet into the sea and explore with his submarine instruments. The Minister of Marine has given orders for a ship of war to be placed at his disposal, and Admiral Choppart has appointed a commission, composed of engineers and naval officers, to attend M. Bazin's experiments officially.

FATAL EFFECTS OF LIGHTNING IN FRANCE.—M. Boudin has recently presented a report to the Paris Academy of Sciences, on the accidents caused by the electric fluid. It appears that during the years from 1835 to 1863 inclusive, 2,233 persons were killed instantaneously. In many instances where the lightning struck mixed groups of persons, it was observed the males suffered far more than the females. M. Boudin contradicts the assertion, which has been made and repeated with much confidence, that the beech tree is never struck by lightning, and declares on the contrary that many instances have been recorded of such accidents. Of thirty-four persons killed in the fields by lightning, in the year 1853, fifteen were struck when sheltered beneath trees; while, during the years 1841 to 1853, out of a hundred and seven killed in the fields, only twenty one were reported to have been near trees. Some of the cases which have occurred this year in Paris were very terrible. Two men were passing along the Rue du Rocher in a covered cart, such as is used to convey linen to and from the wash; the lightning struck the vehicle, killed one of the men and the horse on the spot, melted some of the iron work of the cart, but left the other man completely uninjured.

A MATHEMATICAL CARICATURIST.—M. Gavarni, the celebrated artist, whose clever illustrations are known almost as well in London, where he resided for some time, as in France, has just presented to the Academy of Sciences of Paris a treatise on mathematics.

Correspondence.

TRADE MARKS.—SIR,—When, some time since, I had the honour of addressing you on the subject of trade marks, the statute affecting them had not been enacted, and it was then not too late to entertain hopes that some provision might have been introduced into it for a system of trade-mark registration. The Act, however, has been passed without any such provision, and I anticipate that, before long, practical difficulties will arise in its application and working, and considerable litigation will ensue. Already persons appear dissatisfied with a protection which is weak, from what I may call essential defects. It is true that the extraordinary and unnecessary severity of the penalties which the Act imposes—a severity more in accordance with French than with British jurisprudence—renders the operation of the law almost nugatory. But, were this otherwise, there would still remain serious difficulties in the way of its operation, and grave drawbacks to its success. It seems difficult to believe that there is actually no register of reference which persons might consult to ascertain whether they are transgressing or not. A man may be at a considerable expense in having dies of particular trade marks made, and goods marked with them, and may afterwards learn the agreeable fact that the same marks, or something very like them, had already been appropriated by other persons. Machinery for registration already exists at the Design Office, and arrangements might be made there for recording trade marks without much (if any) increase of the present staff. Again, according to the very large, or liberal, words of the Act, a dot or line might be a trade mark; there is no real definition of what is to constitute a substantial or distinctive trade mark. It would assuredly have been

wiser had the statute contained some sort of general definition of the essentials of a trade mark, or at least some provision for such eventual definition, by administrative or ministerial rather than judicial decision, in case of need. Indeed, such decision might have been safely left (even without ready appeal) to the judgment of an intelligent and discreet registrar, seeing that, in few cases, would intrinsic rights have been prejudiced even by an adverse decision, the case differing from that of copyright in design. The manufacturing and commercial classes generally—with the exception, perhaps, of Birmingham manufacturers—do not appear to take great interest in the Act as yet. A member of your Society, Mr. Edmund Johnson, certainly endeavoured to call their attention to its provisions. If the question be thoroughly ventilated and considered, I believe the new Parliament would be urged to introduce certain modifications in this statute, in the directions which I have ventured to indicate, viz., by establishing a system of centralised registration, by defining, or appointing officers to define, the essentials or composition of a substantial trade mark; and by rendering the penalties more consonant with English notions, and sufficiently appropriate to the offence, to induce their infliction in ordinary course.—I am, &c., M. HENRY.

Fleet-street, July, 1865.

Patents.

From Commissioners of Patents Journal, July 14th.

GRANTS OF PROVISIONAL PROTECTION.

Boats and vessels, fittings for—1731—J. Cox.

Bobbin net or twist lace, production of—1757—S. Bates.

Bricks—1698—T. L. Jowett.

Carriages—1767—J. Harrington.

Carriages, drags for—1680—A. E. Dobbs.

Carriages, locomotive engines and railway—1646—G. Smith.

Carriage windows, railway and other—1718—J. K. Farnworth.

Castors—1689—R. Eastman.

Chair ladder—1232—J. B. Lavanchy.

Cheeses, table for dressing of—1722—W. Percival.

Chisels, &c., heating—1715—W. Brooks.

Circular endless railway—1771—W. E. Gedge.

Clay tobacco pipes—1683—L. White.

Coin, reception of—1675—J. M. Abrams.

Collars and cuffs—1741—R. A. Brooman.

Cotton gins—1714—J. H. Johnson.

Croquet mallets—1704—S. S. Bateson.

Dresses, linings for ladies'—1763—P. Passavant.

Eggs, desiccating—1632—C. A. Lamont.

Feeding bottle, food or fluid regulator for—1727—W. Botham.

Fire-arms, breech-loading—642—F. Tolhausen.

Furnaces—1620—R. A. Brooman.

Furnace bars and fire grates—1672—S. Godfrey.

Furnaces, self-acting apparatus for distributing feeding materials in high—1733—A. Prince.

Gas retorts—1737—W. Schofield.

Gas, supplying to burners—1687—H. S. Snell and F. E. Thomas.

Gunpowder—1679—J. Gale.

Hats, &c.—1707—W. E. Newton.

Hay, straw, &c., apparatus for cutting—1712—J. Spratt.

Hydro-carbons, apparatus for burning liquid—1711—R. A. Brooman.

Knitting machines—1747—G. Davies.

Lace, folding and carding—1238—T. W. Roe.

Life-boats—1688—H. A. Bonnerville.

Liquids, measuring—1674—E. K. Dutton.

Locks—1736—W. E. Newton.

Locomotive engines and in springs of railway carriages—1769—J. E. Wilson.

Magnesium for illuminating purposes—1698—J. Solomon.

Magnesium light—1696—G. R. Bamber.

Metallic tubes and rods—1749—J. Atkins.

Motive power, apparatus for generating—1686—W. Clark.

Motive power, hydraulic apparatus for producing—1701—J. G. Spanopho.

Motive power, machine for obtaining—1468—H. Mosely.

Needles—1686—W. Lusty.

Noxious exhalations, sanitary apparatus for preventing—1636—M. A. Muir and J. McIlwham.

Ornaments—1719—H. Emanuel.

Pecuary—1441—W. E. Gedge.

Pianofortes—1708—W. E. Newton.

Printing in colours—1702—R. A. Brooman.

Punching apparatus, portable—1706—J. Medhurst.

Quicksilver or mercury, amalgams of—1719—W. E. Newton.

Railways, permanent ways of—1765—J. Whittle.

Railways, points and crossings of—1751—W. McGregor.

Railways, securing the rails of—1713—J. Kirkham.

Railway trains, signalling on—1676—M. Siegrist.

Railway trains, stopping—1684—W. J. Murphy.

Railway trains, stopping and retarding—1769—J. Naveau.

Refrigerator—1700—M. Ashby.

Rice, &c., cleaning—1777—J. W. Gray.

Riveting and making rivets, machinery for—1709—H. M. Kessel.

Rivets, bolts, spikes, &c.—1696—E. Finch.

Sash windows, apparatus for preventing opening of, from outside—1728—E. Keynolds.

Ships, steering—1496—W. A. Brown.

Shirt front—1726—W. E. Newton.

Steam boilers, furnaces, and engines—1746—E. Elliott.

Surface condensers—1677—W. E. Newton.

Table or seat, portable—1691—R. A. Brooman.

Taps or valves—1686—E. G. Brewer.

Telegraphic communications, effecting and recording—1687—J. Henry.

Telegraphy, submarine and land—1763—I. Baggs.

Tubular structures—1755—E. Deane.

Twist lace machines—1723—R. Doot and J. Coxon.

Typographic and lithographic printing—1665—W. Clark.

Umbrellas and parasols—1673—N. de Becker.

Under vests—1721—J. Webster.

Vices—1761—L. H. G. Ehrhardt.

Water-closets—967—J. J. Darribet.

Weaving, looms for—1743—J. Keighley.

Woven fabrics, circular pressing machines for finishing—1711—J. Ingham.

Yarns, twisting, doubling, &c.—1644—E. Whalley.

Yarns, &c., to be woven, sizing machines for sizing—1729—D. Mercer, T. Mercer, J. Mercer, and J. Mercer.

INVENTION WITH COMPLETE SPECIFICATION FILED.

Steam and water valves—1634—N. Jenkins.

Announcements by the Council.

PRIZES TO ART-WORKMEN.

The Worshipful Company of Salters contribute £10 annually to this Prize Fund.

The Council of the Society of Arts hereby offer Prizes for Art-Workmanship, according to the following conditions:—

I. The works to be executed will be the property of the producers, but will be retained for exhibition, in London or elsewhere, for such length of time as the Council may think desirable.

II. The exhibitors are required to state in each case the price at which their works may be sold, or, if sold previously to exhibition, at what price they would be willing to produce a copy.

III. The awards in each class will be made, and the sums specified in each class will be paid, provided the works be considered of sufficient merit to deserve the premium; and, further, in cases of extraordinary merit additional awards will be given, accompanied with the sanction of the Society.

IV. Before the award of prizes is confirmed, the candidates must be prepared to execute some piece of work sufficient to satisfy the Council of their competency.

V. *Bona-fide* Art-workmen only can receive prizes.

VI. All articles for competition must be sent in to the Society's house on or before Thursday, the 14th of December, 1865, and must be delivered free of all charges. Each work sent in competition for a Prize must be marked with the Art-workman's name, or, if preferred, with a cypher, accompanied by a sealed envelope giving the name and address of the Art-workman. With the articles, a description for insertion in the catalogue should be sent.

VII. Although great care will be taken of articles sent for exhibition, the Council will not be responsible for any accident or damage of any kind occurring at any time.

VIII. Prizes may be attached to articles exhibited and made, and no charge will be made in respect of any sales.

X. All the prizes are open to male and female competitors, and in addition, as regards painting in porcelain, decorative painting, and wall mosaics, a second set of prizes, of the same amounts, will be awarded among male competitors. If a female desire to compete in the female class only, she must declare her intention accordingly. The originals of the works prescribed may be seen at the South Kensington Museum, in the gallery the entrance of the Sheepshanks pictures.

Castings may be seen at the Society of Arts, Adelphi, London, and the Schools of Art at Edinburgh, Dublin, Manchester, Glasgow, Birmingham, and Hanley in the Potteries.

Photographs, chromolithographs, engravings, rough casts in metal, &c., may be purchased at the Society of Arts, John-street, Adelphi, at the prices named.

The plaster casts may be obtained from Mr. D. Brucciani, 39, Russell-street, Covent-garden, W.C.

. The Council are happy to announce that several of the works which received first prizes in the competitions of 1863, 1864, and 1865 have been purchased by the Department of Science and Art, to be exhibited in the South Kensington Museum and the Art Schools in the United Kingdom.

FIRST DIVISION.

WORKS TO BE EXECUTED FROM PRESCRIBED DESIGNS.

For the successful rendering of the undermentioned designs in the various modes of workmanship according to the directions given in each case.

CLASS I.—CARVING IN MARBLE, STONE, OR WOOD.

(a.) *The Human Figure*.—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work executed in marble or stone, after the Boy and Dolphin cast from a chimney-piece, ascribed to *Donatello*. Original in the South Kensington Museum, No. 5,896. Dimensions to be one-eighth less than the cast (linear).—This design may be adhered to strictly or adapted to any architectural purpose.

[Cast—Fifteen Shillings; Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best work, executed in marble, stone, or wood after a carved chair-back in the South Kensington Museum. Dimensions to be two-thirds of the cast (linear).

[Cast—Twelve Shillings. Photograph—One Shilling.]

(c.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in stone, after a *Gothic bracket* in the Architectural Museum. Dimensions the same as the cast. In this design the details may be improved by the introduction of small animals, and the human head may be changed according to the taste of the art-workman.

[Cast—Ten Shillings; Photograph—One Shilling.]

(d.)—One prize of £20 for the best, and a second prize

of £10 for the next best, work carved in wood after a design by *Holbein*, as an *Inkstand* or *Watch-Holder* on three feet. Dimensions optional.

[Wood Engraving—Sixpence.]

(e.)—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work carved in wood after the *Head of a Harp* of the period of Louis XVI., in the South Kensington Museum, No. 8,531. The head and bust only need be fully completed. Dimensions the same as the cast.

[Cast—Thirty Shillings; Photograph—One Shilling.]

(f.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work carved in wood after an *Italian picture frame* in the possession of Henry Vaughan, Esq. Dimensions optional.—This design may be adhered to strictly or adapted in such manner as the workman may think fit.

[Photograph—Two Shillings.]

(g.) *Ornament carved and gilt*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in wood, carved and gilt after a *Console Table* in the South Kensington Museum, No. 6947, of the period of Louis XVI. The work to be carved roughly in wood, then to be prepared in the white by a gilder, then cut up or carved in the white by the carver, then to be gilt in mat and burnished gold. As such work may probably be executed by two persons, the prize will be apportioned as the judges may determine.

[Photograph—One Shilling.]

CLASS 2.—REPOUSÉE WORK IN ANY METAL.

(a.) *The Human Figure as a bas-relief*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after *Raphael's "Three Graces"*. Dimensions—The figures to be six inches high.

[Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a *Tazza* in silver, date 1683, the property of Sir W. C. Trevelyan, Bart., now in the South Kensington Museum. Dimensions—The same as the model.

[Photograph—One Shilling.]

CLASS 3.—HAMMERED WORK, IN IRON, BRASS, OR COPPER.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after the portion shown in the photograph of the Pediment of a Gate (German work, date about 1700) in the South Kensington Museum, No. 5,979. To be adapted for use as a bracket. Dimensions—Twelve inches deep.

[Photograph—One Shilling and Threepence.]

CLASS 4.—CARVING IN IVORY.

(a.) *Human Figure in the round*.—One prize of £15 for the best, and a second prize of £10 for the next best, work executed after a miniature statuette (Italian), No. 304 in the South Kensington Museum; dimensions—the same as the cast; or after a medallion portrait of Flaxman, by himself, No. 294 in the South Kensington Museum; dimensions—to be reduced in height by one-half (linear).

[Cast of Statuette and Photograph of Medallion—One Shilling each.]

(b.) *Ornament*.—One prize of £7 10s. for the best, and

a second prize of £5 for the next best, work executed after a pair of *Tablets*, in the possession of John Webb, Esq. Dimensions—The same as the cast.

[Cast—One Shilling.]

CLASS 5.—CHASING IN BRONZE.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a reduced copy of "*Clytie*." A rough casting in bronze, on which the chasing must be executed, will be supplied by the Society at cost price—£2 10s.

[Plaster Cast—Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after *Goutier*, from a cabinet in the possession of Her Majesty the Queen. A rough casting in bronze, on which the chasing must be executed, will be supplied by the Society at cost price—3s. 6d.

[Plaster Cast—One Shilling.]

CLASS 6.—ETCHING AND ENGRAVING ON METAL—FIELD WORK.

Ornament.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1523. No. 18,968 in the South Kensington Museum. To be engraved the height of the photograph, and, if round a cup or goblet, repeated so as to be not less than nine inches in length when stretched out.

[Photograph—Sixpence.]

CLASS 7.—ENAMEL PAINTING ON COPPER OR GOLD.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after *Raphael's design of the "Three Graces"*, executed in grisaille. Dimensions—The figures to be four inches high.

[Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a German arabesque (16th century). No. 19,003 in the South Kensington Museum. Dimensions—The same as the Photograph.

[Photograph—Sixpence.]

CLASS 8.—PAINTING ON PORCELAIN.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after *Raphael's "Two Children"*, in the cartoon of "*Iytra*." Dimensions—the same as the Photograph. This work is to be coloured according to the taste of the painter.

[Photograph—Ninepence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after arabesques by Lucas Van Leyden, 1523, No. 18,968 in the South Kensington Museum, and coloured according to the taste of the painter. Dimensions—Double the size of the Photograph (linear).

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section 13.

CLASS 9.—DECORATIVE PAINTING.

(a.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after an *ornament*, from *Casti & Pandino*, near Lodi, from a drawing in the South Kensington Museum.

ington Museum, No. 1,150. Dimensions—length 4ft.—width, enlarged from the print in the same proportion.

[Coloured Print—One Shilling.]

(b.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a *picture frame*, in the South Kensington Museum, No. 7,820. Dimensions—5 feet by 3 feet 11½ inches, outside measure. The works to be executed on canvass, either with or without stretchers, in cool colours. Some lines of the mouldings may be gilt.

[Photograph—One Shilling and Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section IX.

CLASS 10.—INLAYS IN WOOD (MARQUETRY, OR BUHL), IVORY OR METAL.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a specimen in the possession of the Hon. John Ashley. Dimensions—one-third larger than the Lithograph (linear).

[Outline Lithograph—Sixpence.]

CLASS 11.—CAMÉO CUTTING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after *Wyon's* heads of the Queen and Prince Consort, on the *Juror's* medal of 1851.

(b.) *Animal*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after *Wyon's* "S. George and the Dragon," on the Prince Consort's medal. Dimensions the same as the casts.

[Casts—Sixpence each.]

CLASS 12.—ENGRAVING ON GLASS.

Ornament.—One prize of £10 for the best, and a second prize of £3 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the engraving; and if round a glass or goblet, repeated so as not to be less than 9 inches long when stretched out.

[Photograph—Sixpence.]

CLASS 13.—WALL MOSAICS.

Human Head.—One prize of 10 for the best, and a second prize of £7 10s. for the next best, work executed after *Bertini's*, of Milan. A preparatory drawing must be made, coloured, after the lithograph, on which the lines and disposition of the tesserae must be marked. The dimensions of the work should be regulated by the size of the tesserae proposed to be used, which size may be left to the choice of the artist. Although desirable, it is not necessary to execute the whole subject in actual mosaic, but if a part only be done, the eye must be in such portion. A coloured drawing, with tesserae, may be seen at the Society's house, and in the South Kensington Museum, and tesserae of two sizes may be obtained from Messrs. Minton, Stoke-upon-Trent, Messrs. Maw and Co., Brosely, Shropshire, Messrs. Powell and Sons, Temple-street, Whitefriars, and Messrs. Jesse Rust and Co., Carlisle-street, Lambeth.

[Lithographic Outline Coloured—Two Shillings.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section IX.

CLASS 14.—GEM ENGRAVING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed

after a cameo portrait of Savonarola, No. 7,541 in the South Kensington Museum. Dimensions—the same as the cast.

[Cast—Sixpence.]

(b.) *Full-length figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a small Wedgwood medallion, No. 5,827 in the South Kensington Museum. Dimensions—the same as the cast.

[Cast—Sixpence.]

CLASS 15.—DIE SINKING.

Human Head.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after the head of the Prince Consort, by *Wyon*, on the Society's medal. Dimensions—half the size of the original (linear).

[White metal example—Sixpence.]

CLASS 16.—GLASS BLOWING.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an original in the South Kensington Museum, No. 1,818. Dimensions—as given in the wood engraving.

[Engraving—Sixpence.]

CLASS 17.—BOOKBINDING AND LEATHER WORK.

(a.) *Bookbinding*.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed in bookbinding, after an Italian specimen in the South Kensington Museum, No. 7,925. The work to be bound should be some classical author of the size given. Dimensions—the same as the photograph.

[Photograph—One Shilling.]

(b.) *Leatherwork*.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work of boiled and cut leatherwork for the outside covering of a jewel casket. Original in the South Kensington Museum, No. 7,768. Dimensions—one-half larger than the photograph (linear).

[Photograph—One Shilling.]

CLASS 18.—EMBROIDERY.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed, either after a German example in the Green Vaults at Dresden, or an Italian Silk in the South Kensington Museum, No. 7,468, which may be adapted to a screen. Dimensions—according to the taste of the embroiderer.

[Photograph—German, Sixpence; Italian, One Shilling.]

CLASS 19.—ILLUMINATIONS.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, copy made from an Altar Card, attributed to Giulio Clovio, in the South Kensington Museum, No. 2,958, or from a MS. border, date 1450, No. 3,057, in the South Kensington Museum. Dimensions—one-half larger than the Photograph (linear).

[Photograph—Two Shillings.]

SECOND DIVISION.

WORKS TO BE EXECUTED WITHOUT PRESCRIBED DESIGNS.

CLASS 20.—MODELLING.

The Worshipful Company of Plasterers, London, offer the following:—

Ornament.—One prize of £10 for the best, and a second prize of £5 for the next best, floriated bracket or truss in

the Italian Renaissance style—dimensions, 14 inches on the beam, 12 inches on the wall, and 8 inches on the face—to be designed and modelled by the competitor, or the designer and modeller may co-operate in the production, when the prize will be divided between them.

Artizans' apprentices and students may compete for these prizes, but not master tradesmen, masters in Schools of Art, or those training for masters in the Central School of the Department of Science and Art.

CLASS 21.—WOOD CARVING.

(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories.* 1st prize of £25 and the Society's Silver Medal. 2nd prize of £15. 3rd prize of £10.

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(By Order)

P. LE NEVE FOSTER, *Secretary.*

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following is a copy of the Charter granted in 1830 to the Royal Academy of Music:—

George the Fourth, by the Grace of God, of the United Kingdom of Great Britain and Ireland King, Defender of the Faith,—to all to whom these presents shall come greeting. Whereas our right trusty and right entirely beloved councillor, Edward Venables, Archbishop of York, Primate of England and Metropolitan; our Lord Almoner; our right trusty and right entirely beloved cousin and councillor, Arthur Duke of Wellington; our right trusty and well beloved councillors, John Fane, commonly called Lord Burghersh, and Sir John Leach, Knight, Vice-Chancellor of England, and others of our loving subjects, have, under our royal patronage, formed themselves into a Society or Institution to promote the cultivation of the science of music, and to afford facilities for attaining perfection in it, by assisting with general instruction all persons desirous of acquiring a knowledge thereof; and having subscribed and collected considerable sums of money for that purpose, have humbly besought us to grant unto them and unto such other persons who are now, or who shall hereafter become, members of the said Society, our royal charter of incorporation for the purposes aforesaid.

Now know ye that we, being desirous to promote such object, have, of our special grace, certain knowledge, and mere motion, given and granted; and we do by these presents, for us, our heirs, and successors, give and grant that the said Edward Venables, Archbishop of York, Arthur Duke of Wellington, John Fane, commonly called Lord Burghersh, and Sir John Leach, and such others of our loving subjects as have formed themselves into, and are now members of, the said Society, or who shall at any time hereafter become members thereof, according to such bye-laws or regulations as shall be hereafter framed or enacted, and their successors be, and shall for ever hereafter continue and be, by virtue of these presents, one body politic and corporate, by the name of the "Royal Academy of Music;" and

them and their successors, for the purposes aforesaid, we do hereby constitute and declare to be one body politic and corporate, and by the same name to have perpetual succession, and for ever hereafter to be persons able and capable in the law, and have power to purchase, receive, and possess, any goods and chattels whatsoever, and (notwithstanding the statutes of mortmain) to purchase, hold, and enjoy, to them and their successors, any lands, tenements, and hereditaments, whatsoever, not exceeding at the time or times of purchasing such lands, tenements, and hereditaments, respectively, the yearly value, as rack-rent, of one thousand pounds in the whole, without incurring the penalties or forfeitures of the statutes of mortmain, or any of them; and by the name aforesaid to sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended, in all courts and places whatsoever, of us, our heirs and successors, in all actions, suits, causes, and things, whatsoever, to do act and do, in all things relating to the said corporation, in as ample manner and form as any other our liege subjects being able and capable in the law, or any other body politic or corporate, in our said United Kingdom of Great Britain and Ireland, may or can act or do; and also to have and to use a common seal, and the same to alter, vary, break, and renew, as they shall from time to time think fit.

And we do hereby declare and grant that the number of members of the said body politic and corporate shall be indefinite, and that for the better rule and government of the said body politic and corporate, and for the better direction, management, and execution, of the business and concerns thereof, there shall be, from the date of these presents thenceforth and for ever, a Board of Directors, Committee of Management, and treasurer of the said body politic and corporate; and the said Board of Directors shall consist of thirty members, to be elected or appointed from among the members of the said body politic and corporate, one of which thirty members shall be President, and four shall be Vice-Presidents of the said body politic and corporate, and that any five of the Directors, if either the President or one of the Vice-Presidents shall be one of that number, or any five of the Directors, if the President or one of the Vice-Presidents shall not be one of that number, shall be a quorum. And we do hereby nominate and appoint that the said Edward Venables, Archbishop of York, Arthur Duke of Wellington, John Fane, commonly called Lord Burghersh, and Sir John Leach, and such other twenty-six members of the said body politic and corporate as they, the said Edward Venables, Archbishop of York, Arthur Duke of Wellington, John Fane, commonly called Lord Burghersh, and Sir John Leach, or any two of them, shall appoint, shall be the first Board of Directors, and that the first President and the first Vice-Presidents of the said Society shall be likewise appointed by the said Edward Venables, Archbishop of York, Arthur Duke of Wellington, John Fane, commonly called Lord Burghersh, and Sir John Leach, or any two of them, out of such of the members of the said Society as shall have been previously named Directors; and that any President, Vice-President, or Director, shall have full power to resign and vacate his office by giving to the Board of Directors one calendar month's previous notice of his intention so to do.

And that the Board of Directors shall have the power of convening a general meeting of the members of the said Society whenever they may deem expedient. And we do further declare and grant that the Board of Directors shall have the power to make such rules, orders, and bye-laws, as they shall deem useful and necessary for the regulation and management of the said body politic and corporate, and of the estates, goods, and business thereof, and for fixing and determining the manner of electing the future President, Vice-Presidents, Directors, and Committee of Management, and the Chairman thereof, and the period of their continuance:

ice respectively, and also for fixing and determining the hours and places of holding any general meetings of the said body politic and corporate, and for the admission of members, and the privileges to be conferred upon them, and the classes to which they may respectively be pointed to belong, and the annual or other sum or sums of money to be paid by the members of the said body politic and corporate, whether upon admission otherwise, towards carrying on the purposes of the said body politic and corporate; and such rules, orders, and bye-laws, from time to time to vary, alter, or repeal, and to make such new or other rules, orders, and bye-laws, as they shall think most useful and expedient, so that the same be not repugnant to these presents, or to the laws of this our realm.

And for the further rule and government of the said body politic and corporate, and for the further and better direction, management, and execution, of the business and concerns thereof, we do further declare and grant that there shall be a Committee of Management, which shall consist of not more than seven, nor less than seven, members, to be elected out among the members of the said body politic and corporate. And we do hereby nominate and appoint at the said John Fane, commonly called Lord Burghersh, and such other members of the said body politic and corporate, not being more than fifteen, nor less than seven, other members, including the said John Fane, commonly called Lord Burghersh, as the said Court of Directors shall appoint, shall be the first Committee of Management, the said John Fane, commonly called Lord Burghersh, to be the first Chairman. And it is our further will and pleasure that the said John Fane, commonly called Lord Burghersh, shall be and continue Chairman of the Committee of Management: and during the term of his natural life, or until he shall resign; and that every future chairman shall continue in office for such time as shall be declared in the bye-laws or regulations of the said body politic and corporate hereafter to be enacted. And that in case also often as the said John Fane, commonly called Lord Burghersh, shall, at any time during his continuance in office, be absent from England, the Committee of Management shall elect from amongst the members of the Committee a person to be Chairman of the said Committee during the absence of the said John Fane, commonly called Lord Burghersh, and no longer. And it is our further will and pleasure that any member of the Committee shall have full power to resign and vacate his office by giving to the Board of Directors one calendar month's previous notice of his intention so to do; and at the Committee of Management shall nominate and appoint, out of the members of the said body politic and corporate, a fit and proper person to be treasurer of the said Society who shall continue in his office during the pleasure of the Committee, unless he shall resign or vacate the said office. And it is our further will and pleasure that no business shall be transacted at any meeting of the Committee unless three members of the Committee shall be present; and that at the Committee of Management the person in the chair shall, in addition to the privilege of voting with the other members of the Committee, have a second or casting-vote on all questions where the votes shall happen to be equal. And it is our further will and pleasure that the Committee of Management shall have the whole and exclusive direction, management, and superintendence of the students, of the Academy for the education of the students; and also shall have the appointment and removal of the principal musical professor, and of all the other musical professors, and of all the music and other masters, and the subordinate officers and servants of the Society, and shall define and regulate their respective duties, and fix and pay out of the funds of the Society their respective salaries, and shall also have, in every other respect, the entire management and

regulation of the expenditure of the Society; and shall also have full power to draw on the treasurer for such monies as they shall require for the purposes of the Society, and shall also have full power to propose to the Board of Directors such additions to, and alterations in, the rules, orders, bye-laws, and regulations of the said body politic and corporate as they shall think proper; and also shall have full power to appoint such persons, being musical professors resident in England, or officers of any foreign musical institution, to be honorary members of the said body politic and corporate, as they shall deem expedient, every such appointment being in writing, and signed by the Chairman of the Committee. And it is our further will and pleasure that the Committee of Management, at a meeting to be especially called for that purpose, of which due notice shall be given, shall have full power to remove from the said body politic and corporate any member or honorary member of the same, such member or honorary member having been first duly summoned to attend such meeting; but no member or honorary member of the said body politic and corporate shall be removed except by the votes of two-thirds of the members of the Committee. And it is our further will and pleasure that on a certain day, to be fixed by the Board of Directors, in the month of March in every year, the Committee shall lay before the Board of Directors an account of the receipts and expenditure of the Society for the preceding year, and that account shall be audited by two auditors, to be appointed by the Board of Directors from amongst the Directors. And it is our further will and pleasure that all orders and directions to the professors, masters, and subordinate officers and servants of the Society, which shall have been made and determined upon by the Committee of Management for the promotion of the objects of the Society, shall be given and delivered by or through the Chairman of the said Committee; and all the professors, masters, and other subordinate officers and servants of the Society, are hereby required punctually to obey and observe, in the execution of the duties of their respective offices, all the orders and directions which shall be so given and delivered to them by or through the Chairman of the Committee of Management. And it is our further will and pleasure that the Chairman of the Committee of Management shall have full power to call, at any time, an extraordinary meeting of the Board of Directors, and also a meeting of the Committee of Management, whenever he shall deem it expedient. In witness whereof we have caused these our letters to be made patent. Witness ourself, at our Palace of Westminster, this twenty-third day of June, in the eleventh year of our reign.

By writ of the Privy Seal.

SCOTT.

The following dimensions of the principal rooms at the Royal Academy of Music have been kindly supplied by Mr. Lucas:—

Governesses Room—21ft. 7in. by 15ft. 4in.; height, 15ft.

Concert Room—71ft. 8in. by 28ft.; height, 15ft.

Letter K.—26ft. 6in. by 28ft.; height, 11ft.

Letter I.—21ft. 7in. by 16ft. 4in.; height, 11ft.

Letter J.—21ft. by 14ft. 4in.; height, 11ft. Recess—6ft. 3in. by 9ft. 8in.

Committee Room—18ft. 6in. by 14ft. 3in.; height, 15ft.

Letter B.—17ft. 11in. by 10ft. 3in.; height, 10ft. 8in.

Letter C.—22ft. 4in. by 10ft. 8in. and 9ft. 6in.; height, 10ft. 6in.

Letter A. (Gentlemen's Waiting Room)—19ft. by 14ft. 7in.; height, 10ft. 6in.

Letter G.—22ft. 7in. by 9ft. 6in.; height, 7ft. 11in.

Secretary's Office—23ft. by 11ft. 10in. and 17ft.; height, 14ft.

Library—20ft. by 19ft. 6in.; height, 10ft.

Letter D.—16ft. 1in. by 11ft. 9in.; height, 8ft. 1in.

Ladies' Waiting Room—23ft. by 11ft. 10in. and 17ft.; height, 15ft.

Besides the above, there are sleeping rooms for the Governess and servants, also offices, &c.

ON THE IMPERIAL CONSERVATOIRE OF PARIS AND THE ROYAL ACADEMY OF MUSIC, LONDON.

By MANUEL GARCIA.

In comparing the Imperial Conservatoire of Paris with the Royal Academy of Music in London, we are forced to observe that the former has two immense advantages in its favour:—It is entirely supported by the State; its course of study is distinctive and complete. Hence arises a radical difference between the two schools, both as to their appliances and results.

The Conservatoire, as a national institution, has been allotted a suitable locality, which includes in its area various halls, class-rooms, and three theatres. Two of the latter are exclusively devoted to the use of the dramatic pupils and those who propose qualifying themselves for the lyric stage. The third and largest theatre is used for the public competitors, and is the well-known hall of the Conservatoire where operas are performed. Endowed with the necessary funds, the Conservatoire bestows a gratuitous education on nearly 600 pupils, besides presenting annually a purse with £40 to each of its ten most gifted students. All those pupils who are crowned in the public competition receive a prize worth £12.

Formerly boarders of both sexes were accommodated in the Conservatoire, but it is now thought advisable to admit only non-residents. Three times a year the pupils are subjected to an examination before a jury, and those who are not considered sufficiently promising are dismissed. At the same time a summons is sent through all France to supply the vacancies, and the influx of candidates is so great that frequently three hundred are examined at once, thus rendering it easy to make good selections.

Each candidate is obliged to read tolerably a piece of music at sight and sing something he has studied. This trial serves to prove whether he possesses a good voice, correct ear, and musical feeling. Besides these qualifications the pupil must be pleasing in appearance, and not more than twenty years old.

The English Royal Academy is a private institution, always uncertain of its future, and deriving its chief sources of income from the pupils, who pay the somewhat onerous sum of thirty-five guineas annually, besides an entrance fee of five guineas. This amount being much too large for the poorer classes (from which the pupils are almost exclusively drawn), it so reduces the number of aspirants that in its best days the Academy has never contained more than 120 pupils, and at the present moment can count but 72. Most of the scholars, eager to remove such a burden of expense from their families, curtail as much as possible the duration of their studies, and leave as soon as their talents, however incomplete, can be rendered in any measure available as a means of livelihood.

To the above-mentioned chief source of income may be added the voluntary subscriptions, which have greatly diminished since the death of Lord Westmoreland; next the proceeds of a concert, and lastly a grant of £500 recently obtained from parliament.

For its scholarships the Academy is obliged to depend entirely on private donations. Such are—

The King's Scholarship.....	35 guineas.
Lord Westmoreland's	10 "
Mr. Porter's.....	12 "

Total..... 57 "

The net income derived from all these sources is large enough to cover the ordinary expenses of the establish-

ment, but will not suffice for the least additional outlay. For instance, everyone remarks the awkwardness displayed on the boards by young debutants from the London school, and the natural remedy would be to prepare them properly in a theatre; but for want of funds a courtyard, which formed part of the premises of the Academy, and which might have been easily converted into a theatre, has been given up in order to decrease the rent. For a similar reason the Academy is forced to a certain degree of laxity in the choice of candidates, accepting nearly all those who present themselves, without much regard to age or aptitude. What success can possibly be hoped for under such conditions?

We proceed now to an examination of the studies.

The Conservatoire forms, at the same time:—Composers, singers, instrumentalists for orchestra, pianists, organists, comedians, and tragedians.

The studies are superintended by a director and 13 professors, the management of the establishment being exclusively on the director. At the time I belonged to this staff of professors, it comprised

Masters for composition.
16 " for solfeggi.
7 singing masters.
Masters for deportment.
" for declamation.
" for various instruments.

The pupils who make singing their principal study (the only class with which I propose occupying myself in this paper) if unable to read music with facility, are sent into one of the 16 classes for Solfeggi, and there receive elementary instruction. They are then removed into a singing class, where they remain two or three years and undergo during that period several examinations. The places left vacant by departing or dismissed pupils are appropriated to the new comers, and if there are more accepted candidates than can be located they are admitted as listeners while waiting for a vacancy.

When the pupil is sufficiently advanced he joins to the study of singing that of deportment—superintended by a ballet-master, who teaches him to walk and move gracefully, also to express in action all possible situations and emotions. The declamation class then follows, in which the pupil recites the parts he has learnt by heart. These successive exercises habituate him so completely to the stage that at his first appearance he presents himself to the public with the ease and confidence of an accomplished actor.

Besides all this a student of merit has commonly to quit the Conservatoire to pass through the first ordeal of a public competition, both as to singing and taking parts in an opera. One meeting is held for the singers alone, and at this a first and second prize is awarded.

The jury always consists of ten or twelve musicians of eminence, who are all, with the exception of the director, strangers to the Conservatoire. Their judgment is therefore disinterested, and a powerful recommendation to the pupil who is crowned. He who on such an occasion obtains the first prize both for singing and declamation has a right to three débuts at the Opéra Comique. The public competitions terminate with the performance of an opera. In these representations the holders of first prizes first, and it is not unusual to find, on quitting the stage, a manager of some theatre awaiting them with the offer of an engagement.

If from an examination of the French Conservatoire we pass to that of the English Academy, we find the nearly all the advantages of the former are wanting in the latter.

In the first place, at the Academy, Solfeggi is not studied, to the serious detriment of progress in its stages, and, finally, of thoroughness in the acquirement of the artist. It is true that at the Academy there is a class for reading at sight, but in it the notes are not nat-

nd still less do the pupils sol-fa* in the seventh class; secondly, there is no class for deportment; thirdly, the studies do not last long enough, as the pupils are bent on stopping as soon as possible the expenses of their education. The public concerts given by the Academy are wanting in importance, because they give rise to no public decision, and because musical celebrities are not appealed to, or in any way interested in them. Lastly, they end in nothing, and are of no material benefit to the pupil.

From all these facts I draw the inevitable conclusion it is a self-supporting Royal Academy of Music is a failure. An establishment of this kind to be able to compete with the Paris Conservatoire it must have a larger area, at least one theatre placed at its disposal. It must have funds enough to offer a free education to some hundreds of students, and by thus addressing itself to the masses it might meet with some highly gifted natures, by whose influence, after severe and solid preparation, the state of the English theatres might be raised, and national drama finally issue from that state of subservience to foreign drama from which it has so long suffered, though not unduly. Such an object is well worth the expenditure of some thousands per annum.

In France music and painting are placed on the same footing, each receiving aid and protection from government. In England, painting alone is thus recognised and favoured, perhaps because this Art is useful in some branches of industry.

Putting aside all consideration of the pure and ennobling enjoyments music affords to man (leaving pure, because the most chaste and spiritual of all the arts), has it not likewise a real value as an object of commercial enterprise? Does not the impetus which it gives to trade through theatres, concerts, festivals, instrument making, carving and printing, instruction in all branches of the arts, &c., bestow the means of subsistence on thousands of families? Not being furnished with the necessary documents, I cannot here establish the relative mercantile importance of the two arts, but that of music seems to me fully entitled to the same share of encouragement as is bestowed upon painting by the English government.

The military music of France does not depend upon the Conservatoire, being taught in the military gymnasium, where are formed bandmasters and instrumentalists. Mr. St. John, a Member of the Institute, and many years at the head of this school, could, with the present director, give much valuable information on the subject.

Proceedings of Institutions.

THIRSK MECHANICS' INSTITUTE.—The twentieth annual report for last year congratulates the members on the continued progress of the Institution. It has been one of the most prosperous years since its establishment. The singing-room continues to be well attended. The library, which contains more than 1,000 volumes, 49 of which have been added during the year, has been extensively increased, and the issue of the books has been 3,172. The circulation necessitates a considerable expenditure on rebinding, replacing worn out volumes, and providing a supply of the new literature of the day. The committee regret that so small a sum remains for these purposes. The committee regret that Mr. Scott, the

secretary, was compelled, by unavoidable circumstances, to resign a situation he had filled with credit to himself and great advantage to the Institute. The number of members for the past and two preceding years is as follows:—For 1863, 164; for 1863, 159; for 1864, 168. The chess and draught class continues to meet on Tuesday and Friday evenings, and affords recreation to a respectable and orderly class of members. The examination scheme of the Society of Arts was introduced here in 1862, and has been most successful. At first comparatively few candidates presented themselves, but the number has largely increased. Of the prizes offered by the Leeds Educational Board, the 1st and 2nd boys, the 1st girl, and three others came to Thirsk. The great success of the Thirsk candidates has raised this Institution to a higher position among the Yorkshire Institutions than it ever before obtained. Various local prizes are being offered to successful candidates. The balance-sheet shows that the finances of the Institute are in a favourable condition; the receipts were £86 3s. 2d., and there was a balance in hand of £11 8s. 1d.

EXAMINATION PAPERS, 1865.

(Continued from page 576.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

MINING AND METALLURGY.

THREE HOURS ALLOWED.

1. Describe the apparatus most commonly employed for the treatment of auriferous quartz.
2. Which is the principal ore of antimony, and how is metallic antimony commercially obtained from it?
3. How is coke manufactured from small coal, and what are the conditions necessary for the production of coke of good quality?
4. Name the principal varieties of ironstone employed in the United Kingdom, and state from what sources they are severally obtained.
5. How does black oxide of manganese usually occur, and for what purposes is it chiefly employed?
6. Describe in outline the metallurgical treatment of the copper-shales of Mansfeld.
7. How would you estimate by assay the amount of lead and silver contained in a sample of ordinary lead ore?
8. Sketch and describe the stove generally employed for heating the blast of iron-furnaces.
9. Describe the crushing-mill made use of in Cornwall for the preparation of copper ores.
10. What are the essential characteristics of a good fire-clay?
11. What is Kaolin, where is it found, and how is it prepared for market?
12. Name the various ores of zinc, and state their several compositions.

BOTANY.

THREE HOURS ALLOWED.

The Candidate is expected to answer correctly three questions in Section I. and six questions in Section II., including descriptions of at least two of the fresh specimens. Nos. 8, 9, and 10 each stand for an answer.

SECTION I.—VEGETABLE PHYSIOLOGY.

1. Describe the structure and function of roots.
2. Upon what structural and physiological conditions does the success of a graft depend?
3. What are hybrids? What are their characteristic peculiarities?
4. Describe the structure and function of pollen. Name three British genera, belonging to different natural orders, in which its structure is very exceptional.

5. What organs are frequently specially modified in climbing plants.

6. Describe the probable course of the *ascending* and *descending sap* in an apple-tree.

SECTION II.—PRACTICAL BOTANY.

1. Name six *fruits* commonly cultivated in Britain, which are free from adhesion (*superior*), and six which are adherent (*inferior*), indicating which are *apocarpous* and which *syncarpous*.

2. Describe the principal modifications of the fruit in British genera of *Cruciferae*.

3. Give the principal distinguishing characters of the four *cereals* most largely grown in Britain.

4. Describe the structure of the flower and fruit of the (1) *Chestnut* and (2) *Horse-Chestnut*.

5. What is meant by the term *anatropous*?

6. Distinguish *Gramineae* from *Cyperaceae*.

7. Name the *natural order* to which the plants marked A, B, and C, respectively belong, with *reasons* for your opinion.

8, 9, and 10. Describe the three plants marked A, B, and C, in the proper sequence of their organs, and in accordance with the examples given in Lindley's "Descriptive Botany" and Oliver's "Lessons" (Appendix).

AGRICULTURE.

THREE HOURS ALLOWED.

I.

1. What are the principal means at our command for the improvement of light and heavy soils respectively?

2. State the practice and theory of the application of lime to the land—the uses it is believed to serve in the soil—the several modes (including quantities and times) of applying it—the results which are expected from its application.

3. State the purposes served by the plough, the harrow, the roller, and the grubber or cultivator upon the farm.

II.

4. Give a detailed account of the cultivation of the wheat crop after clover and beans respectively; and describe half-a-dozen good sorts.

5. Enumerate the operations, from the previous corn stubble to the folding of sheep upon the crop, included in the cultivation of the turnip crop; and state the probable cost of each.

6. State the proper application (as regards quantity, time of year, and crop) of farm-yard manure, and of such artificial and imported manures as you may think it necessary to bring on a 400-acre farm of light soil cultivated on the four-field rotation of crops.

III.

7. What is the annual cost of working a pair of horses on a farm? specifying quantities and cost of food, wages of man, blacksmith's bill, and the other charges which enter into the account.

8. Describe the year's management of a breeding flock month by month.

9. How much turnips, mangold wurzel, hay, straw, and bought food (oil cake, meal, &c.) will a score of oxen, costing, say £18 a piece, brought home on October 1, in a fit condition to fatten during winter, have consumed by March 1, and what should they then be worth?

ANIMAL PHYSIOLOGY.

THREE HOURS ALLOWED.

1. Describe the general structure of a long bone, supposed to be recently taken from the living body. Then give an account of the microscopic characters of the osseous tissue, especially noticing any structural arrangements which appear adapted to serve in the nutrition of the bone.

2. Give an outline of the physiological uses of the

blood, and mention the constituent parts of that fluid which are concerned in each chief office.

3. What is meant by the "pancreas," where is it situated, what is its purpose or use in the living animal economy, and in what manner does it accomplish that purpose?

4. Give the composition of the atmosphere, including its proper and adventitious constituents. How and to what extent is it rendered unfit for breathing by a succession of human respirations? What other impurities, mechanical or chemical, may also contaminate it, a houses, workshops, factories, or ships?

5. Describe the "external auditory passage," its length, width, direction, and mode of closure at the bottom. Also describe the "Eustachian tube," its connections and the kind of animals it exists in—What are the uses of those two parts; and how may these be ascertained with?

6. Define a reflex and a sensori-motor movement; give one example of each; state the anatomical structures necessary for their performance, and mention organs which they serve in the animal economy.

(To be continued.)

PARIS EXHIBITION OF 1867.

The arrangement of an International Exhibition systematically, without separating the contributions of each nation, has been allowed to be a great desideratum. A method of realising this was sketched out in the report of the Imperial Commission for the Paris Exhibition of 1855, published in 1857; and a writer in the *Bauing News*, of London, proposed a plan of carrying out such an arrangement for the Universal Exhibition of 1862. The mode adopted in these cases was that of a longitudinal disposition of the classes, and a transversal one for the various countries, so that in one direction would be exhibited all the articles of the same class, while in the other might be seen all the productions of any one nation. The same principle has been adopted for the Exhibition of 1867, but with an important difference in the mode of carrying it into effect. The new building is to be on a form, and divided into as many radii as there are classes, namely, ninety-five, as many zones as there are exhibiting nations. A visitor starting from the centre of the building, and proceeding towards the circumference, or *versus*, will thus be enabled to examine all the contributions of one kind and from all countries in succession; while if, on the contrary, he desire to see all the productions of any particular country, he will only have to make the tour of the zone or circle appropriated to it. This arrangement is said to be the result of a long and careful study of the subject by M. Le Play, who was Director-General of the Paris Exhibition of 1855, and Imperial Commissioner at the London Exhibition of 1862, and is appointed Director of the Exhibition of 1867. Such an arrangement has every thing to recommend it; it will save the time of the man of business and the scientific inquirer, and will give to the whole a systematic form that will greatly enhance the value of the Exhibition in an educational point of view. There will, certainly, be some practical difficulties to overcome; the continuity will be broken here and there by the absence of some classes of articles, and it will be necessary to look for exuberance or poverty in others, but the principle is excellent, and it is to be hoped that nothing will prevent its being carried into practice.

M. Krantz, the chief engineer for roads and bridges in the department of the Ardèche, has been appointed to direct the works of the Exhibition.

PROPOSED EXHIBITION OF NATIONAL PORTRAITS.

On Thursday afternoon, the 18th inst., a meeting was held at the South Kensington Museum, for the purpose of promoting a National Portrait Exhibition. The Earl

Derby presided, and amongst others present were Earl Granville, the Duke of Buccleuch, Lord Houghton, the Earl of Clarendon, Lord Taunton, Viscount Sydney, the Marquis of Lansdowne, the Dean of Windsor, Messrs. J. P. Knight, R.A., E. A. Bowring, C.B., J. Spedding, T. D. Hardy, G. Scharf, R. Redgrave, R.A., Rev. Canon Brock, Henry Cole, C.B., &c.

Lord DEBY, upon taking the chair, explained how it was that he occupied that position. The fact was that some time ago, before the Miniature Exhibition was opened, Mr. Redgrave called upon him with reference to any contribution which he might be able to offer, and in the course of conversation he (the noble lord) suggested an idea, which had occurred to him several years ago, which he thought would be of great interest, viz., an exhibition of a chronologically-arranged series of national portraits of historical characters. Mr. Redgrave adopted the suggestion, and reported the conversation to the Committee of Council on Education. That committee took the matter up, and requested him to put down the substance of the propositions which he had ventured to submit. In consequence of that he wrote a letter, extracts from which had been circulated, in which he explained the views he held. He heard nothing more of the matter until he received a printed paper, giving an extract from his letter, signifying the approval of the Committee of Council on Education; and in the list of those noblemen and gentlemen favourable, his name was inserted as president. This certainly took him by surprise, but he felt that he could not decline. They were not there for the purpose of passing any resolutions, but as a committee of advice. The object was to form a collection of portraits—probably beginning about the middle of the fifteenth century, and coming down to a very recent period. These portraits, he thought, should be arranged in chronological order. Not only would this give them a most interesting exhibition of great historical men, royal personages, statesmen, warriors, men of letters, &c., but also an opportunity of tracing the progress of British art during that period, and of studying the works of such men as Holbein, Vandyck, Lely, Kneller, Gainsborough, Romney, Lawrence, Hudson, and others. He thought that to the students of history, as well as to the general public, such an exhibition would be of the greatest possible interest. It was a question to be settled by circumstances whether the exhibition should be for two or three years. That would depend upon the number of contributions and the space at their disposal. It was very important that they should consider the best means of addressing the proprietors of the numerous portraits scattered throughout the country. Mr. Samuel Redgrave, who had been so successful with regard to the Miniature Exhibition, had kindly undertaken the necessary correspondence; and it was proposed that the exhibition should take place in the arcade which served as refreshment-rooms during the Exhibition of 1862. There were high side windows, and, having a north light, the place was not subject to an inconvenient glare. Within the last half-hour Lord Granville, Mr. Cole, and himself, visited the place. On one side was a blank wall, and on the other a series of windows, divided by bays. It was proposed to have a passage on the window side, and have screens at intervals of 18 or 20 feet, so as to afford more space. There would be a side light upon all the pictures except those occupying the bottom of the bays. These would be subject to the disadvantage of having the light opposite to them. They had calculated that if they gave each picture 24 square feet of room, there would be space for 800 portraits. There would be three entrances—one in the Exhibition-road, one in the Prince Albert-road, and another from the Horticultural-gardens. It was proposed to open the exhibition in April, 1866, and of course it would depend upon the number of portraits how many exhibitions there would be. If they had three exhibitions he thought they should begin with the earliest time, and to come down to the present; if they had only two, that

the first period should come down to 1688, and the second to the present time. He would recommend that the pictures should be distributed rather sparsely, and not crowded together. With regard to the promises of support, he had communications from several, and had received great encouragement. The moment the proposal took a definite form, he thought it desirable and respectful to her Majesty that she should be consulted, and that if possible they should obtain the valuable assistance of her approval and co-operation. He had therefore communicated with General Grey, who in his reply stated that her Majesty desired him to say that the proposal received her warm approval, and that she would be happy to assist in furthering the object; whatever her Majesty could do in contributing portraits from the Royal collections would be done. General Grey added that with respect to the collection at Windsor there might be some difficulty, as her Majesty resided there so much; but still it was very likely that something might be done even there. At Buckingham Palace there would be no difficulty. The letter concluded by saying that the proposal received her Majesty's best sanction. He (the noble lord) congratulated them upon this, as they could not begin under more favourable auspices. Lord Exeter had promised to do what he could; so had the Duke of Wellington.

Earl GRANVILLE considered that they were most fortunate in having Lord Derby as President, and thought they ought to thank him for his valuable suggestion.

Mr. SCHARF suggested that they should take three different classes of persons instead of the chronological order—say royal personages first, then warriors, &c., and, thirdly, men of letters, or some such order.

Lord DEBY thought the chronological order would be preferable to a division like that suggested by Mr. Scharf, as it would be more interesting and instructive. There was one question which he should like Mr. Scharf to answer, as he was the representative of the National Portrait Gallery. He should like to know how far they (the National Portrait Company), and other public bodies, would be justified in contributing from their own stores. How far, for instance, the trustees of the British Museum would feel themselves at liberty to assist. There was the Society of Antiquaries, again; how far would they be willing or able to contribute? In Downing-street there were apartments appropriated to the use of the Prime Minister, and in those rooms were portraits of past Prime Ministers arranged in successive order. Of course they would be very valuable if the Prime Minister would consent to their temporary removal.

Earl GRANVILLE agreed with the noble lord that it would be best to have a chronological arrangement. It was important to know what the action of the public bodies, such as the British Museum, would be.

Mr. SCHARF was certainly not entitled to speak authoritatively on the part of the authorities of the National Portrait Gallery; but when he had the pleasure of submitting to them the proposal of this committee, they at once expressed their cordial interest, and he thought they would do all in their power to promote the proposal.

The Earl of CLARENDON agreed with Lord Derby that the best arrangement would be that of chronological order. The pictures previous to 1688 would be most interesting, and the pictures which he had should be at the disposal of the committee.

Lord TAUNTON thought it was important that the proprietors of pictures should know, if possible, how long their portraits would be kept.

The Earl of DEBY said four or five months—April, May, June, and July—to be returned in August. What he thought was, that in April, 1866, there should be an exhibition of portraits coming down to the time of Charles II., or the Revolution; these pictures to be returned in August; and then, in 1867, an exhibition of those subsequent. If there were enough pictures for three exhibitions, then there would be another in 1868.

Lord TAUNTON suggested that busts should be included.

Mr. COLE stated that the building in which it was proposed to put the portraits would be thoroughly dry, heated by hot water, and guarded day and night. Letters had been received from the following, expressive of their cordial sympathy, and promising assistance:—The Duke of Buccleuch, Duke of Devonshire, Duke of Marlborough, Duke of Wellington, Duke of Cleveland, Marquis of Lansdowne, Lord Brownlow, Lord Spencer, Lord Claremont, Lord Sydney, Lord De L'Isle and Dudley, Sir Robert Peel, Mr. H. Hawkins, Mr. John Murray, the Dean of Christchurch, and others.

The Earl of DERBY said they had received between eighty and ninety letters of assent, and only two or three of dissent.

Earl GRANVILLE then proposed the best thanks of the meeting to the Earl of Derby for his kindness in taking the chair, and giving them the suggestions.

The resolution was at once adopted; and the noble chairman having thanked the meeting, the proceedings terminated.

Manufactures.

PORTUGUESE INTERNATIONAL EXHIBITION.—Arrivals from Oporto state that the Crystal Palace building is completed, and the annexes in an advanced state. The committee have, however, some intention of deferring the opening from August to September, in consequence of the very hot weather which prevails in August. The European countries are all filling up readily the space allotted them, and Great Britain will make a very fine display of her arts and manufactures. Messrs. Ransomes and Sims, of Ipswich, propose to fill the large space of 2,100 feet with Fowler's steam plough, steam threshing-machines, and various agricultural implements. Among the exhibitors of machinery, &c., are the Reading Iron Company, Messrs. Gwynne and Co., the Economic Permanent Way Company, N. Mills and Co., Birmingham. Tools and implements, &c., are also well represented by the Sheffield and Birmingham houses. In glass and pottery, among other exhibitors, are Messrs. Harper and Moore, of Stourbridge; Hope and Carter, Burslem; Maw and Co., Benthall Works, near Broseley; the Hill Pottery Company, Burslem. Messrs. Silver and Co. send furniture, portmanteaus, clothing, &c. Merryweather and Sons, one of their steam fire-engines. Carriages are represented by Hooper and Co., and Thrupp and Maberley, of London; Storey, of Nottingham, and others. Textiles are represented in woollens by Joseph Craven and Co., of Bradford, and others; Linens, by Gwynet and Co., and Johnson and Co., of Belfast; Irish poplins, by Pitt Brothers and Co., of Dublin; while Dodge, Skill, and Co., and others, send India-rubber goods.

COST OF IRON PLATING FOR SHIPS.—A correspondent, writing from Toulon, says that thirty-six plates for the armour of the *Taureau*, described as of *fer acéré* and twelve centimètres, equal to 4½ inches English, in thickness, which have just been delivered at the arsenal of the Mourillon, cost 80,841 francs, and only represent about one-tenth of the whole of the armour of the vessel in question. He adds that the plating of the frigates of the type of the *Gloire* and *Provence* costs, on an average, 800,000 francs, or £32,000. In addition to this he says that, considering the power of the enormous guns which are being produced on all hands, the Imperial government has decided on using plates eight inches in thickness, and that the first application of such armour will be to the *Marengo*, which is now building at Toulon.

Commerce.

SHARK, RAY, AND DOG FISH.—M. Duméril has recently made a communication to the Acclimatisation Society of

Paris respecting the amount of products derived from these three fish, either for alimentary or industrial purposes, in which it is said, amongst other things, that the lindos sent during one year to the Bombay markets, for importation, no less than 229,240 kilogrammes, or 229 tons of fins of the white shark, taken off the east coast of Africa, the Malabar coast, and in the Red Sea. The quantity of dog-fish fins sent to China annually is said to reach on an average seventy tons, and the value is estimated at nearly fifty thousand pounds sterling. The amount certainly seems large for a portion of a fish which Europeans regard with so little favour.

THE TEA TRADE.—Messrs. Travers' *Circular*, of July 22nd, says:—The elections are now nearly over, but the excitement attending them has not been favourable to business, and it is probable that some weeks may yet elapse before this has entirely subsided; at present there seems to be little likelihood of any immediate change for the better. It would seem that the elections have affected this market more than that for any other article of produce; indeed the trade for tea appears to be particularly sensitive to the influence of passing events, and the article itself seems to be still regarded more as a luxury than as a necessary of life. It is not easy to estimate the effect which any general out-door excitement, accompanied as it usually is by the free use of other stimulants, has upon the consumption of tea, but it must be considerable enough to diminish for the time the sales made by grocers, and as a consequence, the necessity for their laying in fresh supplies. On the whole, although the elections may have injured for the time the business of the regular trader, it must not be forgotten that by finding temporary employment and remuneration for many persons who have no regular income, large sums of money are circulated, and the power to purchase necessities and luxuries is in consequence increased, so that there is a fair prospect of the loss being made up by subsequent larger sales. Meanwhile demand is still deferred, and it seems likely that its increase will be spread over a longer period, and be much more gradual than was at first anticipated. Even those who were the most sanguine as to the effect of the reduction must, by this time, be aware that its results are to be traced rather in steady augmentation of deliveries and a greater equality of value than in excited markets and speculative prices. The simultaneous rush which was predicted might have occurred had trade stocks been low, and had prices continued moderate, but as the very reverse of this was the case, there was no necessity and little temptation to purchase; everybody in consequence held off, and time was afforded for the excitement to cool down. As regards supply, the news brought by the last mail from China is on the whole of a satisfactory character, and seems to prove that no scarcity need be apprehended. It is true that the rebels are still in force in some of the tea districts, but their vicinity appears to exercise wonderfully little influence, and to increase rather than to diminish the prospects of an abundant supply. The opening price having also been higher than it was last year, manufacturers will be encouraged to push forward large quantities from the later crops, and it seems probable that the shipments of the present season will not be below the average. As regards quality, the news brought by the mail is not so satisfactory. So far as it was possible to judge from the first samples of the new crop received at Foo Chow, all the worst faults of last season's shipments appear to have been repeated, if not exaggerated. This is no doubt owing to hasty preparation, partly caused, it may be, by the proximity of the rebels, and partly by a desire to reach the market early, and so to obtain a higher price. The importance of India as a competitor for the supply of this market seems as yet to be scarcely recognized in China, and even to be totally ignored; but those who ship from the latter country may rest assured that unless the quality of their imports improves, and comes up to the standard of three years ago.

they will be left behind in the race, as fine tea will, under the new rate of duty, be more in demand than ever. Production is extending so rapidly in India, under the influence of European skill and energy, that the exceptional prices at present paid for its teas cannot long be maintained, and ere many years have passed the two competitors will meet on equal terms in this market, where, with the strict justice that is inevitably awarded in all free markets in valuations and sales, the preference will of course be given to the tea which combines the requisites of fine flavour and great strength.

Colonies.

AN EXHIBITION OF COLONIAL GEMS came off in Melbourne in May last. Diamonds from the Ovens River, near Geelong, rubies, opals, garnets, sapphires, amethysts, and in the rough, from various parts of the colony, were on view, and excited much interest among miners and others. There can be little doubt that many thousands of precious stones have been thrown away among the "tailings" of wash-dirt and crushed stuff by reason of closing eyes not yet having become educated to the habit of recognizing and distinguishing one stone from another in its natural state.

THE COLONIES AND THE PARIS EXHIBITION.—Already the British colonies are beginning to take action in the matter of the Paris International Exhibition for 1867. A proportionably larger display of colonial products has been made at the Dublin Exhibition, than at any former exhibition, speaking relatively as regards space, for nearly one half of our colonies were represented there to a greater or less extent. The Australian colonies, Canada, and British Guiana, and other of our principal possessions were represented at the last Paris exhibition, and now a number of other colonies will take part in the exhibition, the desire to bring their various indigenous resources before the European world being strong. The immense indirect advantages flowing from these exhibitions are so palpable that no amount of eulogy devoted to them, however great, can be deemed thrown away. From Victoria we hear that movement is already being made in preparation for the Paris Exhibition. New South Wales, Queensland, and Tasmania are sure to take part, and New Zealand and South Australia will also see the policy of taking action. The colony of Natal proposes to ask a vote of its Legislature of two or three thousand pounds, to make a noble exhibition of its various resources. It is proposed to get made up articles of utility or ornament, manufactured from colonial products, so that the raw material may be shown side by side with the manufactured article. Natal made a very creditable display of her products at the last London, and the present Dublin exhibitions, and will far outstrip them at the great Paris gathering.

WATER SUPPLY IN THE DARLING DISTRICT, NEW SOUTH WALES.—It may now be safely asserted that well-drinking in the country to the north-west of the Darling is not proved a failure, as was some time since reported. Some attempts may have failed, but water has been obtained of good quality and in large quantities in various parts of the trans-Darling province, which consist, principally, as far north as the 29th parallel of latitude, of excellent sheep country. From the Barrier Ranges across to the Mount Searle Ranges (the "Far North" of the South Australians), a large number of wells have been sunk with great success. In the "Far North" five "runs" out of six are supplied entirely by means of wells. The depths vary from 20 to 120 feet, averaging about 60 feet, with an abundance of water, on which stock thrive well.

CUSTOMS DUTIES IN NEW SOUTH WALES.—The much vexed question of the Customs duties on the River Murray has at length been amicably settled. For several years past the Government of New South Wales have lost the duties to which they were entitled on goods brought across the River Murray from Victoria, the Government

of that colony having persistently refused to enter into any arrangement for their collection. One consequence of that refusal was the establishment last year of Custom-houses on the border, which proved a source of serious loss and annoyance to the people on both sides of the river, as well as a great interruption to the intercolonial trade. Correspondence on the subject was re-opened between the two Governments, and it appears that the Melbourne Ministers admitted that New South Wales was entitled to the duties payable on goods consumed within her territory; and that an agreement, to last for six years, was entered into, under which the right of levying duties on the Murray was to be farmed by Victoria from New South Wales for an annual sum to be paid by the former in consideration of all duties to which this colony might be entitled, upon goods imported into it by way of the River Murray. The amount to which New South Wales should be proved to be entitled was to be subject to a charge of 5 per cent. for the cost of collection. What the annual worth of these border duties is has hitherto been only guessed at, and the conjecture has varied from fifty to a hundred thousand pounds. The real amount will now be accurately determined.

Publications Issued.

THE BREWERS' JOURNAL.—(No. 1, July 15th, 1866).—Of this publication the first number has just appeared, and is presented as a supplement to the *Wine Trade Review*. In their preliminary statement the proprietors say:—"It is our intention to provide thoroughly reliable intelligence on passing occurrences affecting the trade. These accounts will be consistently brief, and will include much exclusive information of great importance which our peculiar position enables us to obtain. Disputed matters will be thoroughly sifted, and all *ex-parte* statements avoided. Our market reports and statistics will embrace all that the brewer, malster, hop merchant, grain dealer, agent, or commission-man can require. The statistics will be carefully compiled from the best sources, and will be so condensed as not to confuse the eye and understanding with repetition of figures. All the parliamentary Acts and statistical returns will receive punctual attention, and be so stripped of their official language as to make them intelligible at the first glance. Under the head of 'Notes of New Inventions' all new machinery, appliances, and processes, will be examined. No inducement shall turn us from the course we have adopted with our other journal—that of deciding in an impartial manner in cases where our opinion is solicited, and we feel in a position to give it. Our readers may rest assured that we shall never hazard an opinion. Where opportunity does not exist for the practical testing of a new invention, we shall confine our remarks to a mere description—with drawings if necessary—and the advantages claimed for it by the owner. The most useful among new patents will be brought before our readers, and a record kept of the various improvements from time to time introduced into our principal establishments. A column will be reserved for 'Correspondence' and a fair portion of our space will be set aside for free discussion, in proper terms, of special questions. We cordially invite this correspondence. Our 'Price Current' will contain the latest changes in the London market before the publication of each number. The various special growths of hops will be distinguished, and no pains will be spared to render the figures correctly. 'Odd Items' will be a column devoted to the collection of small facts and rumours. Business changes, stoppages, failures, meetings of creditors, law notices, and the opening of new businesses, will receive particular attention: while scraps of trade news contributed by our subscribers will here find a place. In our 'Reviews' all new works bearing on the subjects upon which we treat will be fully noticed."

Forthcoming Publications.

FIRE, FIRE-ENGINES, AND FIRE-BRIGADES, with a History of Manual and Steam Fire-Engines, their Use and Management; Hints for the Formation of Fire Brigades and Remarks on Fireproof Buildings, the Preservation of Life from Fire, and the Volunteer and Paid Systems. Octavo. By Charles F. T. Young, C.E. (*Lockwood and Co.*)

Notes.

RAILWAYS IN FRANCE.—It appears, by the returns published by the Minister of Public Works, that the total length of railways authorised between the years 1823 and 1850 was 3,525 kilometres; between the latter year and 1860, 11,390; and from the last date to December, 1864, 5,067 kilometres, making a total of 19,982 kilometres (a kilometre being rather more than six-tenths of a mile), very nearly 12,000 English miles. In addition to this total, more than 900 kilometres have been decreed, and are about to be carried into execution. The extent of lines actually in work at the present moment is a little more than 13,000 kilometres, or 7,800 English miles, or rather less than two-thirds of the entire amount decreed.

RAILWAYS AND TELEGRAPHS IN RUSSIA.—The Russian Government is actively engaged in extending its system of railways and telegraphs. A railway is now being constructed to connect the Lemberg line with Odessa, and another from Tchernovitz to Galatz on the Danube. The State has recently decided on the construction of another line from Kremenchoug and Balta, in connection with the trunk line from Odessa to Kharkof. The line from Dunabour to Vitebsk is being carried out, and the company is bound to complete the work as far as Polotzk by November next year, and to open the whole line within twelve months more from that date. The necessary capital has just been raised for the formation of a railroad from Posen to Warsaw. The grand undertaking of connecting Russia with America by means of the telegraph, is being carried out under a treaty between the Imperial Government and the American Western Union Telegraph Company. This projected line is to pass through Nicolaief, Behring's Straits, the Russian possessions in America, and British Columbia, to St. Francisco, where it will be connected with the telegraphic system of the United States. The capital of the company is fixed at ten millions of dollars, of which nearly eight millions and a half are said to be already subscribed. The line is to be finished in five years, under forfeiture of the concession of the company, which is otherwise to last for thirty three years. Another important scheme is the continuation of the Prussian line of telegraph from Kiachta on the Tartar frontier, to Peking, and a director of the Russian telegraphs has been for a long time in communication with the Chinese government at Peking on the subject.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following is the memorial of the Royal Academy of Music praying for the grant of a site on the Kensington-gore estate, addressed to the Commissioners of the Exhibition of 1861:

The directors of the Royal Academy of Music beg leave to submit, for the consideration of the Commissioners of the Exhibition of 1861, a statement of the nature and objects of this Institution, with a request that site may be assigned to them on the estate at Brompton belonging to the Commissioners, for the purpose of erecting a building suitable for the accommodation of the Royal Academy of Music.

In the year 1822 Lord Westmoreland brought forward a plan for the establishment of an academy for the instruction of music in all its branches, for which, up to that time, no general school or institution existed in this country. This plan was approved of by his late Majesty George the Fourth, and, thus recommended, a considerable subscription was in a short time obtained, and the academy was established in the following year.

In 1830 a charter of incorporation was granted, constituting the Institution a corporate body, under the title of "The Royal Academy of Music."

In 1834 a fourth part of the proceeds of the Great Festival in Westminster Abbey, amounting to £2,250, was given to the Academy, which sum was invested in the names of trustees, and the interest appropriated to the establishment of King's scholarships. Two scholars, one female and one male, are elected every year for the term of two years, so that there are always four on the foundation; these receive their musical education gratuitously.

The number of pupils received into the Institution since its foundation amounts to nine hundred and twenty-eight. Many of these now hold the first position in the principal orchestras of the country, many have distinguished themselves as vocalists, and some have attained a high reputation as composers; and there can be no doubt that the great majority of the pupils, who have qualified themselves to act as teachers, have materially contributed not only to the present state of improvement in the art, but also to the establishment of a better system of instruction in the metropolis as well as in the country.

The number of students at present in the Academy is

one hundred and twenty-one in all; namely, seventy-four females and forty-seven males; a strong proof of the high estimation in which it is held by those persons who are connected with the musical profession, more especially as, from the want of other funds, the students are required to pay nearly the whole expense of their education.

The income of the Academy has for some years been about £4,000, the greater portion of which, about £3,500, is derived from the contributions of the pupils. The interest on the funded property, £7,500, is £236, and the amount of the subscriptions about £300 per annum.

This short account will be sufficient to show the nature and objects of the Institution. As an educational establishment, the Royal Academy of Music has eminently fulfilled the purpose intended when the means at its disposal are taken into consideration. But the state of the funds has not, at any period, been in a prosperous condition; indeed, it has had to contend against pecuniary difficulties of such a character as, on more than one occasion, to threaten its very existence.

The actual amount of the funds, after all debts shall have been paid, is about £6,500, including the grant from the Westminster Abbey Festival. The committee, therefore, have only a sum of about £4,000 at their disposal to apply to any building purposes—a sum barely sufficient to make the necessary provision for the accommodation of the Academy in the event of a site being given up to it.

It might, however, be highly desirable to combine, with the rooms required specially for the use of the Academy, a large music hall, a music library, and rooms for the exhibition of musical instruments, which would not only be highly serviceable to the musical public generally, but have become almost necessary from the present advanced state of the art.

The cost of such buildings would probably be about £20,000, a sum far beyond what the directors of the Institution could provide. But as the large music hall might be available for other public bodies who might hereafter be located on the property of the Commissioners, some assistance might be obtained from them. A sum of money may possibly be obtained on debentures, to be issued on the security of the buildings, from persons interested in the advance of the musical art; it being understood that the large room might be let for concerts, or holding public meetings, under such regulations as may be approved of by the Commissioners.

The plans of any building proposed to be erected would, of course, be submitted to the Commissioners for their approval; but should it be necessary to incur any additional expense on account of external decoration or architectural ornament, the directors of the Royal

Academy of Music venture to hope, that for such expense they might receive some aid from the Commissioners.

Proceedings of Institutions.

HUDDERSFIELD MECHANICS' INSTITUTION.—The twenty-fourth annual report expresses great satisfaction in the fact that the number of pupils attending the classes shows a considerable increase over the previous year. This increase has been chiefly in the junior classes; the senior classes, although showing a slight improvement, have not been attended as numerous as the committee could have wished. The following is a statement of members, exclusive of annual subscribers and honorary members:—1863, fortnightly members 966; presentees 284; females 29—total 1,279. 1864, fortnightly members 1067; presentees 326; females 85—total 1,428. Payment from the pupils, 1863—£315 1s. 6d.; 1864—£336 15s. Annual subscriptions, 1863—£289 16s.; 1864—£265 13s. The committee regret that the members have not availed themselves more of the advantages which the library offers, the issue of books during the past year being only 8,055 against 10,020 in the previous year. The committee have considered the desirability of purchasing a number of new books, in order to make the library more attractive. The fortnightly meetings have been eminently successful, and the best thanks of the committee are due to those ladies and gentlemen who have so kindly given their services gratuitously. The lectures and concerts during the past year were numerous. Amongst the former may be mentioned one by Mr. J. Bower, "Popular Delusions;" one by Mr. Thomas Westoby, "The Life of Barnum;" one by Mr. J. H. Bower, "Local Politics 500 years ago;" one by Mr. Frank Curzon, "Shakespeare a Workman;" one by Mr. W. F. Crook, "The Manners and Customs of the Chinese;" one by Mr. Wm. White, "Gold and its Properties;" also readings and recitations by Mr. Samuel Laycock, "The Lancashire Poet," and Mr. T. Collins, in the Lancashire dialect. The classes, 88 in number, continue to be the principal feature of the Institution. A canvass has been made amongst the working classes, and small bills have been distributed, pointing out the various advantages which the Institution offers. The best thanks of the committee are due to the voluntary teachers and penny bank assistants for their valuable services during the past year. The attendance in the classes was in 1863—62,739; in 1864—68,326. On the five evenings in the week nearly all the classes are engaged in elementary studies. On Monday, Tuesday, and Thursday reading from good text books, carefully explained by the teachers, forms the basis of the work; and in this way an outline of English history, geography, and some knowledge of grammar is given. On the Monday and Friday nights the classes throughout the Institute are occupied with writing and arithmetic. The drawing classes show a considerable increase in numbers, and the progress of the pupils during the year has been very encouraging. The average monthly attendance of this class was, in 1863—368; and in 1864—482. In connection with the drawing class the thanks of the members are due to Edward Brooke, jun., Esq., who, in the early part of the year, announced a prize of three guineas for the best design of a garden vase. From the drawings of the competitors—each of which are creditable—the judges awarded the prize to Mr. Wm. Catton. Mr. Brooke followed the offer up by another of six guineas, for modelling the vase from the drawing, and the work was being

completed. The singing classes have made considerable advance. The average monthly attendance was, in 1863—164; and in 1864—208. The bookkeeping class keeps up its numbers. The loom class, though not so numerously attended as it ought to be in such a large manufacturing district as Huddersfield, has produced very satisfactory results. In the chemical class the number on the list is 32. The average attendance is 24. The French class has numbered twenty pupils, and the teacher reports their progress as satisfactory. The excursion to Liverpool notwithstanding its many attractions, proved financially a failure. The weather was very unfavourable, and this a great measure accounts for the want of success. The committee are greatly indebted to E. A. Leatham, Esq., M. P., for his kindness in permitting a gala to be held in Whiteley-park. The penny savings bank continues to be prosperous. In 1863, the number of depositors was 19,666; withdrawals, 3,805; amount of deposits, £2,045 1s. 1d.; amount of withdrawals, £1,690 15s. 2d. In 1864, the number of depositors was 18,000; withdrawals, 4,148; amount of deposits, £2,037 16s. 6d.; amount of withdrawals, £1,957 18s. 7d. The number of accounts open December 31st, 1863, was 3,849. The number of accounts open December 31st, 1864, was 4,220. Mr. Walter F. Crook has resigned the secretaryship, and Mr. Joseph Bate has been selected as his successor. The cash account shows that the receipts have been £823 0s. 10d.; and that the balance in hand was £72 10s. 11½d.

EXAMINATION PAPERS, 1865.

(Continued from page 588.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

DOMESTIC ECONOMY.

THREE HOURS ALLOWED.

1. Enumerate under different heads what Domestic Economy embraces.
2. What circumstances would influence you in choosing a dwelling house? Show that a house at a low rent may be dearer than one at a greater charge.
3. What are the advantages and disadvantages of living in a town, especially with reference to bringing up a family?
4. Describe a simple and efficient method of ventilating a sitting-room containing an open fire-place.
5. A small bed-room, which has no fire-place, is lighted by a window, which does not open; explain fully why it would be dangerous to sleep in this room with the door shut; and say how you would establish a good system of ventilation in the apartment.
6. What are the objections to a crowded dwelling?
7. Is it an advantage to a labourer to receive his wages in small payments frequently rather than in large payments at greater intervals? Why, morally and economically?
8. Calculate the loss to a working man in the course of the year which would arise from his buying tea and sugar in small instead of large quantities, supposing the family to consist of six persons.
9. Give advice on the management of a family of six persons as regards

- (a.) Food
- (b.) Clothing
- (c.) Dwelling

the wages of the father being 30s. per week.

10. What are the various disadvantages to the family of a working man where the mother is constantly employed away from home?

1. In out-door agricultural employment.
2. In the mills of the manufacturer.

11. How do the above employments affect the future prospects, in industrial life, of children whose mothers are employed?
12. If you wished to secure a deferred annuity for life, commence, for instance, at the age of 60, what is the most desirable way of doing so?
13. In what does the post-office savings bank differ from the old-established savings bank?
14. Calculate the relative cost of gas and candles; the gas-burner giving as much light as three tallow candles elve to the lb., at 6d. per lb.; the three candles burning 1 hour, and the gas-burner consuming 5 cubic feet of gas in the same time, the gas costing 4s. 6d. per 1,000 cubic feet.
15. How does breathing sustain animal life, and how does it warm the body? What articles of food are principally used by the inhabitants of very cold climates, and why?
16. Class the various articles of food under the heads—
 - (a.) Flesh formers
 - (b.) Heat givers
 - (c.) Bone makers.

What article of food combines the three to the greatest extent?

17. In a dietary for children would you allow more or less of flesh-forming food, in proportion, than for an adult? Why?
18. Show that cheap and easily-procured food may not be a constant blessing to the nation possessing it.
19. Can you account for the alteration which takes place in the moral and physical character of a poor Irish labourer after leaving Ireland for one of the colonies?
20. Write a short essay on the value of the potato as an article of food.

POLITICAL AND SOCIAL ECONOMY.

THREE HOURS ALLOWED.

First series to be answered if possible throughout.

1. Who, during this century, have been the most distinguished writers or legislators on subjects of political economy, and with what doctrines are the names of each most connected?
2. What are the four principles of taxation laid down by Adam Smith? Which of them is said to be contrary to the imposition of a duty on malt, and how is that made out?
3. What have been the most remarkable instances of reduced taxation during the last 20 years, and what has been the result of such reduction?
4. What are the objections to the employment of contract labour under the system of assignment, more especially in the case of the skilled labourer?
5. In what way, and from what sources, is London supplied with water; and on what principle is a limit put to the amount of dividend that may be paid to shareholders of water and other similar companies?

Optional Questions.

1. Compare the incidence of taxation on poor and rich.
2. What is the principle according to which the burden of supporting the poor should be apportioned?
3. What do you understand by the principle of reciprocity as applied to commercial treaties; and how far is that principle opposed to the principle of free trade?
4. What is the relation in which profit and interest bear to each other; and in what way does Mr. J. Stuart Mill differ from what he says to be the received notion on this subject?
5. What do you understand by "average" in mercantile language; and what is the difference between general and particular average?

GEOGRAPHY.

THREE HOURS ALLOWED.

1. Taking the eastern coast line of Britain, from the Firth of Forth to the mouth of the Thames, name in successive order the principal headlands, estuaries, river mouths, and seaport towns that fall within its range.
2. Enumerate, in geographical succession, the counties that lie along the west and south-west coasts of Scotland, from Cape Wrath to the head of the Solway Firth; also the principal seaports within those limits.
3. Make a list of the principal rivers of England and Wales, classifying them as they fall respectively into the German Ocean, the English Channel, the Bristol Channel, or the Irish Sea. Name a town situated upon each.
4. Write a brief account of any one of the countries of Continental Europe, describing its natural features, climate, productions, divisions, and chief towns.
5. Enumerate the North American colonies of Britain, stating briefly the leading characteristics of each, as to position, features, climate, and industrial resources.
6. Write a fuller account of Canada, stating the distinguishing conditions of its eastern and western divisions (Lower and Upper Canada), its industrial resources, and the position of its principal towns.
7. Enumerate the British Colonies on the Australian mainland, with the capital of each. Say which of them includes Cape York, the northernmost extremity of Australia? Which Cape Leeuwin, its S.W. point? Which Spencer's Gulf? Which Port Philip?
8. Draw (from memory) an outline map either of Canada, New South Wales, or Tasmania. Mark on it the chief natural features and the places of a few towns.
9. Give some account of Victoria (Australia): describe its coast line, chief inland features, climate, industrial resources, population (in round numbers), and chief towns.
10. Give a similar description of Queensland.
11. What is known respecting the constant, or periodical, movements of the atmosphere within the warmer latitudes of the globe. State, in general terms, their direction and limits, also the causes to which they are due.
12. What are isothermal lines? In what respect do they differ from parallels of latitude, and how can the difference be explained? Why do they rise on the western side of either continent, and sink as they are prolonged to the eastward?

ENGLISH HISTORY.

THREE HOURS ALLOWED.

N.B.—Dates are to be given in all cases.

1. What were the principal changes effected in England by the Norman Conquest?
2. What was the commencement of the House of Commons, and what have been the chief epochs in the growth of its power?
3. Describe the battle of Crecy.
4. Explain witan, socage, praemunire, impeachment, bill of pains and penalties.
5. What were the claims of Henry VII. to the throne of England?
6. What was the Covenant, and what were its effects?
7. Mention the chief events and measures of the reign of William III.
8. Give a short account of the American War of Independence.

SPECIAL SUBJECT.

9. What were the effects of John's surrender of his crown to the Pope?
10. Give the provisions of Magna Charta.
11. Describe the battle of Lewes.
12. Write the life of Simon de Montfort.

(To be continued.)

COLONISATION; ITS ASPECTS AND RESULTS.*

By WILLIAM STONES, Esq.

THE GENIUS OF ENGLISHMEN FOR COLONISING.

This is doubtless primarily due to the influences of our geographical position and the geological character of our country.† If we examine a terrestrial globe, it will be found that Great Britain holds the advantageous position of lying close to, and yet detached from, the frontier of the Old World, of which it is the nearest point to the New World, the broad highway of the ocean spreading and stretching from the very doors of her central emporium to the most remote of her customers. This insularity causes easy accessibility from and to all quarters and nations, and gives a much larger amount of coast line than enjoyed by any other nation, as will be seen from the following table:—

Country.	Coast Line.	Square Miles of Surface.
Europe	1 mile to every	166 square miles of surface.
N. America... 1	"	228 " "
S. America ... 1	"	376 " "
Asia..... 1	"	459 " "
Africa..... 1	"	623 " "
France..... 1	"	170 " "
Great Britain. 1	"	57 " "

Her abundance of harbours, and numerous rivers, although insignificantly small compared with many others in the world, being nevertheless of dimensions available for inland navigation, and unobstructed by rapids or waterfalls, conduce to the production of a numerous and bold population, accustomed to brave old ocean in his fiercest wrath.

In 1862 we are reported to have had an aggregate of 424,000 ships, of 61,600,000 gross tonnage, employed in our foreign and coasting trade; and throughout the year nearly fifty vessels, averaging 145 tons each, leave a British port every hour; while a fleet of some hundred yachts, starting on a great sea race from Cowes to Cherbourg—an unintelligible fact to most foreigners—attests the aquatic inclinations of our countrymen.

All English boys have an inborn love of the sea, and the most inland youth is quite willing to run the chance of sickness, provided he can have a sea trip.

With comparative equability of climate—such that the shortest days are sufficiently long, and the longest sufficiently temperate, to allow a reasonable amount of work being daily performed throughout the year—this island of ours is suitably placed for obtaining the largest possible result from human energy, being neither prevented by the short days and the extreme cold of the north nor by the excessive heat of more southern countries; and this expression of national energy, when at all impeded at home, seeks its manifestation abroad. Again, our mineral wealth, arising from the geological nature of the island, leads many seriously and coolly to face danger of another kind. The coal and metal miners of England number upwards of a quarter of a million of men—about a twelfth part of the male population of the country—and it is scarcely possible that this body of men can descend into the bowels of the earth, facing the dangers of such an employment, without being confirmed in their self-reliance and adventurous spirit.

Possessing an innate love of independence, and the national self-reliance greatly developed by their pursuits, if we add to the seafaring and mining divisions of the population the speculative spirit of the commercial class and the low condition of agricultural labourers, we find ample reasons and impetus for so many

seeking abroad the accomplishment of their several desires, each emigrant finding in some one or other of our colonies a field suitable for his utmost exertions, the improvement of his fortune, and the acquisition of land, objects so zealously pursued by all Englishmen. The secluded habits of Englishmen enabling so large a proportion of them to exist without café, club, companion or hotel, is a great feature in a colonising point of view. When his allotment or run has been selected, there he erects a hut or cottage, plants a garden, surrounds himself with a few pet dogs and birds, and settles down in his "home" for years. It is remarkable how even well and highly-educated single men will start off into the bush, and remain, with a herd of cattle or flock of sheep, hundreds of miles from any important town, with a probability of very rarely seeing a white companion other than their own shepherds or stockkeepers. Nothing but an indomitable and self-denying postponement of the present to the future could induce so many to undergo self-banishment. Present self-restraint and confident persevering hope in the distant future, is the great secret of colonial success. Nor ought we to omit noticing the intense love of sport and general spirit of exploration and adventure which characterize many of those of our countrymen whose fortunes do not compel them to resort to a colony for their subsistence or pecuniary advantage. In a broad sense we may say that to English voluntary exertion most of the exploration of the world is owing, whether it be the north-west passage, the source of the Nile, or the traversing of Australia. All honour to these brave men, whether living or dead.

EFFECTS OF EUROPEAN COLONIZATION UPON OTHER RACES.

For the purposes of this paper, and speaking generally, they may be classed into three groups:—Negroes—Asiatics—Other coloured races. The first have almost invariably been made slaves; the second have been incorporated and treated as fellow-subjects; the fate of the third has been extermination.

A somewhat melancholy reflection must often occur to those who have possessed opportunities of conversing with the original native inhabitants of our colonies, but almost universally there exists a deep-seated sentiment and fearful foreboding, in the minds of the thoughtful amongst them, and many such there are, that their race must disappear before the European.

A strong, firm conviction impresses them, rising at times to a kind of fatalism, that gradually, but as sure as the tide creeps up on the shore, their doom is either to retire, dwindle, and disappear before the pale-faces, whom will pass the lands of their fathers,—or to do fighting a sad hopeless battle of despair, their feeble galls powerless to sustain them against the fiat of the white man's Deity. Their native habits and customs are unable to endure the shock of collision with a civilization to which they cannot conform, and whose vices tend to their rapid diminution; and the result is the same whether we take the case of the most warlike with whom we have come in contact—the New Zealanders, or on the other hand the very low race of Australians.

The following extract from a Tasmanian newspaper bears on this subject:—

"The Hobart Town Mercury notices the presence at the last government ball in that town of the last living male representative of the aboriginal race of Tasmania, accompanied by three aboriginal women, the sole survivors of their nation on the female side. It is estimated, with some degree of accuracy, that the natives numbered about 2,000 in 1830, but have of late years been rapidly disappearing under the "civilising" influences of the colonial government. In former times they were treated with great cruelty and barbarity by the colonists; but in the year mentioned a plan for transporting them to Flinders Island, and keeping them there, was adopted. The result, which had been foreseen by many, is about

* See the Paper read before the Society on the 3rd of May last (p. 405). The present article, which will be followed by others by the same author, treats of portions of the subject which time did not then allow Mr. Stones to touch upon.—Ed. J. S. A.

† See an able article on "The Causes of England's Greatness," in the *Quarterly Journal of Science*, by Mr. Pengelly, January, 1865.

of the four surviving individuals who were present at the governor's ball." The *Hobart Town Mercury* concludes its notice of this incident as follows:—"With whom does the blame of this rest? Most assuredly not altogether with the natives themselves. No one can say with truth that they were not as much sinned against as sinning in matters that befell them. The original population is one, and their extinction, as a race, was probably as inevitable as it is inscrutable. As savages they were found, as savages they lived, and as savages they perished. Such a event is deserving of some notice." Is it ever to be so? Is it a necessary law of this earth? Caribs, Red Men, Aborigines, Tasmanians, New Zealanders all cease, and their places are taken by the Anglo-Saxon race.

In all moderate climates Europeans seem to have supplanted the native races; only in the extremes of hot and cold countries has co-existence been possible; and even in such climates, harshness of treatment, degradation, and slavery have been the leading characteristics of conduct on the part of the invaders, until, by the almost total disappearance of the aborigines, the necessities of the labour requirements of the colonies have had to be met by the introduction of the hardy African race. Whether, on the whole, that race has to thank or curse our colonisation is a difficult question to answer, as will be evident by a moment's consideration of the moral and social debasement brought upon Africa by its internal wars for the obtaining of slaves for sale, the miseries to which the wretched are exposed in transit, and the eventual condition of the slaves, without hope, family, or life, at the will of others. Every thinking Englishman, who regards the contest recently concluded in North America must feel profoundly thankful that thirty years ago this country roused itself, at the loud call of noble men, some of whom are still amongst us, enjoying a green old age, to incur the expense of redressing a great moral wrong, and at the large price of £20,000,000 the blot of slavery was removed from our flag and country. From the 1st August, 1835, no slave has been held by a British subject. Great cost, did we say? Can freedom be dear

at any price! This price vanishes into utter insignificance when compared with the already huge avalanche of debt, some £600,000,000, which is rolling over the States of North America. Throughout that vast continent the serpent still gnaws on, poisoning the roots of all domestic, social, and political happiness, filling the national mind and soul with increasing discord and hatred—bitter, intense, and lasting—the distress of the widow and the wail of the orphan. Attempt to disguise it as we may, the question at the bottom is, slavery—property in human blood and bones—man a chattel. In the interval between the writing and printing these notes, four millions of human beings, without the slightest preparation, have been liberated from slavery. Time only will show whether the feared results will be realised. Truly slavery, whether in its initiative, continuation, or conclusion, is "a bitter draught."

As a memorial of the payment made to clear the British national conscience, the subjoined table of the compensation prices paid to the owners for their slaves in our several colonies may not be without interest; and I submit for consideration when the decay of some of the West India estates is so prominently brought forward, that as the principal item in the value of the properties consisted in the number of slaves, and as they were redeemed by the British public, it would be scarcely fair to expect the plantations to be as profitable as formerly, which seems to have been anticipated by many planters. Time is bringing about a better adaptation to the new state of society.

It has been stated that the emancipated negroes do not increase in numbers as they did whilst in a state of slavery, owing to vicious indulgences. But this statement seems hardly borne out by the population columns; and as the increase cannot be owing to any large influx of Europeans, and the immigration of Coolies can scarcely account for the increment, it must be inferred that the black population does not diminish, as has been supposed, but the contrary.

There is one point of view in connection with the surging

TABLE SHOWING THE HIGHEST AND LOWEST VALUE OF SLAVES IN THE BRITISH COLONIES, AT THE TIME OF THE EMANCIPATION; THE HIGHEST AND LOWEST COMPENSATION GIVEN; THE NUMBER OF SLAVES IN EACH; GROSS AMOUNT PAID TO EACH COLONY; AND THE POPULATION OF EACH COLONY IN 1850 AND 1861.

* 1856.

In addition to the pecuniary compensation given, the slaves, it will be recollected, were required to serve an apprenticeship for a term years—six, if I remember correctly. One extraordinary item is found in the "Antigua" Account, consisting of an appraised value of a slave under the "Aged, diseased, or non-effective" class, 5d., and compensation, 1½d.

apply began to fall off, and in 1861-2 there was a very large extra demand for medicinal preparations, which, to certain extent, still continues, but the demand for mechanical use has since that time been very trifling. New areas of supply are opening, and prices, it is said on good authority, are likely to fall.

THE SILKWORM CULTURISTS in France announce the birth hatching of the larva of the *Bombyx albes*, an enormously large silk moth. This gigantic moth has never before been seen alive in Europe; and if it can be introduced into France it will prove of the greatest commercial use. Its cocoon is extremely large, and weighs nine grammes, whilst those of the ordinary worm do not exceed two grammes in weight. The grub lives on the leaves of a species of barberry shrub.

NEW MODE OF PREPARING WORT.—The *Brewers' Journal* states that an invention has been registered by Hychert, of Paris, for a new way of preparing wort in the making of beer. His plan is as follows:—"I throw on the ground malt, intended for the vat, enough cold water to form a thick mass. I take care to mix well the malt, to let the water penetrate into all its parts. I then let the mixture remain for about an hour, to obtain the solution of the diastase; at the end of that time the mass of water is let out containing the dissolved diastase. Working well, I add to the mass in the vat or copper, whichever it may be, which still contains a notable quantity of diastase, a sufficient quantity of hot water to rise at a temperature of 75 deg. The mixture being perfectly homogeneous, I let it remain some time, and then boil it or let it attain at least a temperature of 90 deg., be it in the vat (if there is a way of introducing steam) or be it in the copper, but mind and stir it well, the malt will adhere to the sides of the vat or copper. Keep it boiling for about an hour, taking care to stir it constantly; remove it then to the vat (if the boiling has been effected in a copper), and let it cool down to 75 deg.; now should be added the best part of the dissolved diastase, which being nearly cold, produces a fresh coldness. If this should be done whilst stirring, which must be continued for some time afterwards. Let the mass stand about another hour, and then let off the wort, which, the tempering has been successful, should be quite bright and clear, having a soft and agreeable taste. You may add to that remaining in the vat the rest of the dissolved diastase and enough water to raise the temperature to 75 deg., and again proceed in the manner before advised. If the malt in the first place has been properly ground from the first tempering, nearly all the starch will have been turned to sugar; but if the ground malt is not been enough crushed, you make with profit a third or several temperings, in which case you must be careful of your diastase. By this proceeding all the existing starch is converted into sugar, which augments considerably the quantity of wort, and makes it singularly light and clear; it does not contain any particle of dextrine, and is perfectly free from dextrine; and, again, being nearly all sugar, it results that the beer manufactured has a very agreeable taste, and will keep a considerable time without turning sour."

Commerce.

THE FRENCH WINE TRADE.—The vines everywhere thrive well, presenting a brilliant aspect, which induces at hopes both in respect to quality and quantity. In most vineyards the vintage will begin early this year.

GERMAN YEAST.—The payments made for German yeast during the last ten years will probably excite no surprise from their magnitude. In 1855, the value of this import was £143,851; in 1856, £171,374; in 1857, £180,378; in 1858, £111,539; in 1859, £172,216; in 1860, £184,079; in 1861, £186,337; in 1862, £204,404;

in 1863, £209,837; and in 1864, £231,748; a yearly increasing amount, and forming an aggregate value in the ten years of more than one million and three-quarters sterling for this simple article.

CHINESE TEA AND SILK.—The shipments from Chinese ports to the latest dates were 117,915,545 lbs. of tea, being 722,202 lbs. above last year's export, and 30,719 bales of silk, nearly 10,000 bales less than last season.

HOPS.—While the import of foreign grown hops appears to have fallen off this year, they have very greatly increased since 1850. In that year the imports were 6,479 cwt.; in 1854, 119,040 cwt.; in 1861, 149,176 cwt.; and in 1863, 147,281 cwt. The value has increased considerably. In 1860, £568,901; in 1861, £657,763; in 1862, £723,034; in 1863, £626,660; in 1864, £549,863.

TIMBER AND WOOD.—There seems an increasing demand for timber, judging by the increase in the imports of last year. In 1855 the value of the timber and wood imported was £3,567,870; in 1860, '61 and '62, an average of £4,500,000; in 1863 and '64, nearly £5,000,000. Of these sums foreign timber and wood contributed in 1855, £1,645,108; in 1860, £2,238,021; and in 1864, £2,569,585.

WOOL.—There is not an active demand for English wool among the staplers in the manufacturing districts, and the collectors of wool do not find it easy to sell at rates current a few weeks past. There is, however, more than an average consumption, and prices can hardly be quoted lower. The manufacturers are well employed in the clothing districts, and the value of colonial and other wool is well sustained. The progress of the woollen trade has fully kept pace with, and perhaps outstripped, the advance in the imports of the raw material. Thus the value of the woollen and worsted manufactures exported from the United Kingdom in 1850, was £8,558,690. In 1863 it made a bound to £10,172,182; in 1859 they made another great stride, going to £12,063,708. In 1862 they rose to £13,148,431; and, in 1864, to £18,566,078. Last year's figures were of course swollen by the high price of raw material, but 1864 was, nevertheless, a progressive period. These details refer wholly to the export trade; but the home demand for woollen and worsted goods has also immensely expanded during the last fifteen years.

BEET-ROOT SUGAR.—The following is from the *Journal des Fabricants de Sucre* of July 27th:—"Floods of rain have followed the violent storms which have borne devastation into the North, l'Aisne, l'Oise, and La Somme; the beet-root again shoots forth vigorously, but has in many places lost its leaves from the effects of the hail, while the grey worms or other insects continue, wherever they have settled, the course of their destruction. Such are the salient facts of the position of a crop the appearance of which begins to manifest itself, although its result is yet difficult to estimate. Thus, as we have previously said, a good part of the crop, about two-thirds, is out of the question; its return will reach probably more than that of the average; as to the rest it is impossible to make the least valuation. With these late rains it is to be feared that the plant will for a long time remain green, and will then ripen badly. On the other hand, the beet-root which has lost its leaves will be retarded, and the new leaves will form to the prejudice of the saccharine part. In Germany and Belgium where they suffer the same phenomena of temperature as in France, there exists also a great deal of uncertainty about the future of the crop, which everyone agrees to consider as incapable of exceeding that of the past year, which, in the Zollverein, reached the amount of 165,000 tons, and which, compared to a normal year, such as that of 1862-63, was much better than in France. Taken altogether, it seems to follow from this information and these estimates, that, on the whole, there will be this year in Europe at least as much sugar as last year, and that the surplus, if surplus there should be, depends entirely on the temperature from now to the end of September, that is to say, from

the last shoot of the beet-root to its ripening. The ravages wrought on the beet-root by numerous worms, continue to form the chief object of thought with them and the growers, who seem justified in feeling surprised that no official commission has been charged with the study of this question, on which depends, in a great measure, the future of one of the most considerable trades of the country."

Colonies.

TELEGRAPH TO MELBOURNE.—Melbourne has been brought into telegraphic communication with London by the opening of the Anglo-Indian line. The first press message received in Victoria was published in the Melbourne *Argus* of the 19th April. It was despatched from London on the 20th March, and but for an unfortunate accident to the steamer *Madras*, it would have been delivered in Melbourne on the 18th April, or just 23 days after its despatch.

THE EAST DARLING DISTRICT, NEW SOUTH WALES.—An interesting report has been drawn up by the Assistant Commissioner of the Albert district of a tour through what has been known as the dry country, to the east of the Darling, and lying between that river and the Lachlan. Mr. Byrne's journey extended over 700 miles of this country, and his report as to its capabilities is favourable. Three or four years ago the occupation of this country was considered remote; the river frontages were taken up by settlers, but it was thought dangerous to settle beyond the reach of the river. But the completion of the railroad to Echuca, together with the increased supply of steamers on the Darling, has lessened the difficulties of transit, and given a greatly increased value to the land. The necessity for finding fresh pastures for the increase of flocks and herds, together with the emigration of squatters from Victoria, has stimulated the demands for sheep runs in this district, and so far as the taking up of fresh pasture land is concerned, this portion of the colony of New South Wales has been the most progressive. Mr. Byrne, in his report, divides the country he traversed into four varieties—the mountainous, the undulating, the salt bush and the scrub. The first three can be mostly utilized; though some of the more mountainous portions seem too rugged to be very inviting. The salt bush country is not all plain, as has been generally supposed, though there are very large stretches of level country in it; the gullies in this broken country may hereafter be found to offer fine opportunities for making dams for the storage of water. On the flat country Mr. Byrne felt the want of water very much, and his party was on one occasion three days without it. The creeks that run down from the hilly country soon vanish, as the soil is very absorbent. Wells and tanks are absolutely necessary for the plain country. Except in localities where irrigating canals can be cut from the river, Mr. Byrne does not speak of permanent water anywhere; even in the mountainous districts the larger creeks do not appear to retain water for more than three or four months after rain. The formation in these ranges is mostly limestone, which is not considered the best for the production of nutritious grasses. The undulating country contains a fair supply of timber; the soil is a soft, red loam, and bears a very good herbage. It is heavy to travel over, and it will probably be found that railroads are the best roads for Riverina. Across the level country lines suited for the traffic could be made for £3,000 to £4,000 per mile.

PROVISION AND LABOUR MARKET IN THE COLONIES.—The following Table, extracted from Messrs. Silver and Co.'s "Emigration Circular," gives the prices of provisions and the wages of various classes of labour in the colonies, at the dates mentioned:—

LES ŒUVRES DE LAVOISIER. Edited by M. Dumas. 4 volume. Paris.—M. Dumas, of the French Institut, has just presented the third volume of the works of the great chemist Lavoisier to the Academy of Sciences of Paris. All the world knows how vast were the services of that great chemist, but few are aware, perhaps, that he fell a victim on the scaffold. M. Dumas' work will greatly increase the interest that surrounds the name of Lavoisier, who was not only a chemist, but a labourer in most all branches of physical science. Amongst the practical remains of his labours that exist is a gigantic thermometer which Lavoisier constructed, and which still exists in the cellars of the Observatory of Paris. The object of this instrument was to exhibit variations of temperature however slight, and each degree is represented on the scale by a space of four inches. It appears, according to the statement of the Imperial astronomer, M. Le Verrier, that its indications do not agree with those of other instruments, and it is proposed by him that another instrument should be constructed on the same scale, in order to correct this discrepancy. It appears also that Lavoisier contributed largely to the scientific and administrative reports which appeared under the name of his friend Bailly, who fell with him under the revolutionary axe; the notes left by Lavoisier on this subject are very extensive, and M. Dumas has included the substance of them in the volume which has just been presented to the Academy of Sciences.

Notes.

PUBLIC WORKS IN PARIS.—The extent to which demolitions, changes, improvements, and ornamentation are being carried on in Paris is already without parallel; at it appears that what has been done during the last seven years is, after all, merely a commencement. The Prefect of the Seine has asked for the large sum of 70 hundred and fifty millions of francs, or ten millions sterling, to carry on the work of transformation, and the Corps Législatif has acceded to the demand, backed, as it was, by the Imperial Government, but with a protest in the form of a minority of 50, the majority numbering 73. The question is a mixed one, composed of political, social, and industrial elements. One party argues that the amount of work projected is far too large, and the expense ruinous; another that the workmen of certain trades, such as masons, carpenters, joiners, and painters, are being drawn to the metropolis in vast numbers, to the detriment of other parts of the country, with the other danger of their own demoralisation from the effect of their being withdrawn from their families and their connections, and flung into the turmoil of a luxurious and crowded city, where living is dear, and temptation to excess of all kinds great, and, in addition to all this, with the possible danger in prospect of an end to the work, a great fall in wages, and general discontent; a third holds that, however desirable may be the changes projected, it would be far more economical, and more conducive to the general well-being and comfort of the population, if execution were spread over a greater space of time. These are no doubt very serious questions, and deserve the attention of all political and social economists, who, moreover, can hardly expect ever to have such another extraordinary case presented for their study as that now furnished them in Paris. The large sum in question is to be raised on terminable annuities of sixty years, the issue of which is to be spread over a term of our years. Of course the exact application of the whole of this money cannot yet be known; but some important items are already settled. In the first place, the cost of clearing new streets and opening up various parts of the

town, which are now crowded, ill-drained, and inconvenient, is estimated at seventy-five millions, or three millions sterling. Another great work is the conversion of the old military road, which now forms the outer ring of Paris, into a series of noble boulevards; the present road is only about thirty feet in width, the new boulevards will be four times as wide, and will be planted with four rows of trees, two rows on each side, with a promenade between. The entire length of these new exterior boulevards will be more than twenty miles. An immense garden or pleasure ground is being made at the Buttes Chaumont or Saint Chaumont, lately one of the wilds of Paris, a huge irregular piece of ground where plaster quarries have existed for centuries. The new *parc* will cover more than fifty-five acres. The ground, having been excavated in parts to depths of from one to two hundred feet, will be partly laid out in terraces, and one great hollow is being converted into a lake of considerable size. On a promontory is being constructed an exact counterpart of the Temple of the Sibyl at Tivoli. This park will be a great boon to the population of this almost inaccessible and heretofore deserted part of Paris. Amongst the buildings to be executed are, the new opera house, which is considerably advanced, and the Hôtel Dieu, which is to be rebuilt. The reconstruction of this hospital has given rise to much controversy, there being a strong opinion against its re-erection on a small island, but the opposite party has triumphed, and the new Hôtel Dieu is to be built, according to the plan proposed some time since, and published in the *Journal*, on the same island but on the opposite bank to that occupied by the existing hospital. It will be nearly in face of the Palais de Justice, and behind the new Tribunal of Commerce, will cause the suppression of nearly all the old narrow streets still existing in that half of the old city, and will have the Seine and the Quay Napoleon on one side, and wide avenues on each of the other three sides. The counter project of erecting only a small hospital of reception on the island, and a much larger one, in direct communication with it by means of an underground railway, in a more salubrious situation away from the river, was rejected on account of the alleged inconvenience which would result from its adoption, not only to the patients themselves, but to the medical men and pupils of the medical schools. Amongst the improvements to be introduced into the new hospital are mentioned the placing of the kitchens, bath-rooms, store-rooms, and other subsidiary departments in the underground floor, and the connecting the whole together by means of a railway. The ground floor, as well as the upper stories of the building, are to be devoted to sick wards, each being provided with a spacious parlour or day gallery, washing rooms, and a shaft down which soiled linen and everything to be got rid of will descend direct to the vaults underground. A lift, large enough to hold a man sitting or lying, is to serve the whole of the floors. Amongst the more ornamental works now in course of execution or to be carried out, are, the placing of sixty new candelabra on the Place de la Concorde, which is already lighted by as many such lamps, and by eight rostral columns, each carrying two lights; the place will be illuminated by no less than a hundred and thirty-six large gas jets. The number of lamps along the whole length of the avenue of the Champs Elysées is also to be doubled. The angular spaces opposite the front of the Church of the Madeleine have been planted with trees of several years' growth, and supplied with fountains, flowers, and seats, fixed and moveable. The decoration of the walls of the great court of the Hôtel des Invalides, with mural historical paintings, by M. Masson, is proceeding rapidly, and those portions which are finished are spoken of favourably. The Hôtel de Ville is being thoroughly renovated, outside as well as inside; and amongst other decorations in hand is that of the Municipal Council Chamber by the painter Yvon. The subjects selected for this purpose are four episodes memorable in the history of the city: Clovis, habited in Roman purple,

making his entry into the capital; Philippe Auguste placing his children under the protection of the Municipality of Paris, previous to his departure for the Holy Land; Francois I. laying the first stone of the Hôtel de Ville; Napoleon III. signing the decree annexing the suburban communes to the City.

COLLECTION OF LEADEN ANTIQUITIES.—The city of Paris has just purchased, for the sum of eighteen thousand francs, a very curious collection of old objects in lead and pewter found in the Seine. These leads, as they are called, are mostly cast, but in some cases are hammered *repoussé* work, and are divided into nine groups—Badges and insignia of the old industrial corporations; those of religious fraternities; those of officials attached to the church; and those worn by persons connected with the royal household; medals; pilgrims' badges; popular images; political emblems; and miscellaneous. The collection has been placed in the library of the Hôtel de Ville.

DANGER OF TOUCHING A BODY STRUCK BY LIGHTNING.—M. Bourdin, who has reported to the Academy of Sciences of Paris on the effects of lightning, from the year 1835 to 1863, gives two extraordinary instances of persons being injured by contact with the bodies of others who had been struck. In one case, which happened in June, 1854, a man was killed by lightning near the Jardin des Plantes, and the body remained for some time exposed to heavy rain. When the storm had passed two soldiers were about to raise the body, when they both received violent shocks. In the second case, two artillerymen were ordered to raise up some telegraphic posts which had been thrown down during a storm at Zara, in Dalmatia; they took hold of the telegraphic wires, felt first a slight shock, and then were immediately afterwards thrown down. Both had their hands burnt, and one was killed. The other, in attempting to rise, fell immediately upon touching the elbow of a comrade who had run to his aid. This last was also thrown down, experienced a severe shock, and his arm was burnt at the place where the other had touched it. To avoid the danger of such secondary accidents, M. Bourdin recommends the discharge of the electricity from the mouth or other part of the body first struck by means of a whip of straw, or some such conductor, placed in communication with the earth, taking care, of course, to surround the same with a good non-conductor at the parts where it is taken hold of.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The Committee met on June 5th, 1865.

Present: HENRY COLE, Esq., C.B., in the chair, Sir Geo. Clerk, Bart., Sir J. Harington, Bart., Sir J. P. Boileau, Bart., Sir. Francis Sandford, and Capt. Donnelly, R.E.

M. OTTO GOLDSCHMIDT was examined by the Committee as follows:—

174. You are one of the Professors of the Royal Academy of Music?—I have been so since Christmas, 1863—about eighteen months.

175. Professor of what?—The pianoforte.

176. Have you had an opportunity of becoming acquainted with the system of management there generally, or is your experience limited to your own classes?—I have become to some extent acquainted with it, because I have the pleasure of knowing, in addition to the Principal, one or two of the directors of the Academy. I have repeatedly had conversations with them on the subject; and this, together with the experience I have gained in the discharge of my own duty, enables me, I believe, to judge of the working of the Academy.

177. You understand that the object of this Committee is the improvement of the Royal Academy of Music, which, like all other institutions, may perhaps be said to be capable of improvement. Have you any objection to state generally your opinion with regard to the Royal Academy of Music, and as far as your experience has gone, the opinion you have formed with respect to it?—Before offering any opinion perhaps I ought to state that I was for three years a student at Leipsic, at the time when Dr. Mendelssohn Bartholdy was chief director. I also know to some extent the Academy of Vienna, and the academy lately established at Dresden. I am honorary member of the Royal Academy at Stockholm, and I have had some opportunity of observing the working of the Academy at Paris. This comprises the extent of my knowledge of the musical academies abroad.

178. Do you find much difference between those academies and the Royal Academy of Music?—Yes.

179. Broadly speaking, what should you say the differences are?—The difference is in the working chiefly. The Royal Academy is worked, if I may so say, by professors individually; whereas abroad it proceeds from

a directorship as its centre, and there is more of one spirit prevailing the continental academies than seems to be the case in the Royal Academy. I think there is a want of unity of working.

180. You think there are good reasons for arriving at that opinion, and that probably the cause might be remedied?—In my opinion certainly.

181. Will you favour the committee with your opinions on that subject?—The Royal Academy is not worked by departments with responsible heads. There are many professors. I can hardly tell the number, but I believe there are nominally half as many professors as pupils, say about thirty-six professors to about seventy pupils. The Royal Academy of Music had no grant from the Government until last year, and I hope I shall not give offence in saying that there have been many opposing interests, which the Academy has found it necessary to conciliate, and which, with a position rendered firmer by means of a public grant, it might disregard. All the professors teach independently of each other. I have taught at the Academy eighteen months, and during that time I have had very few opportunities of speaking with the other professors about our pupils and their progress. The professors are paid per lesson, and, no provision at present existing for joint deliberations with regard to their pupils, they cannot engage in such deliberation except at the sacrifice of the hours that should be given to tuition.

182. In point of fact the professors go there simply to give the lessons to the pupils?—Yes; I speak under correction when I add that the only distinction as to their position in the Academy consists in their rate of payment. In other respects we are all on a level. I consider this should be altered.

183. Has there been no board of professors since you have been connected with the Academy?—About the time I entered on my duties the functions of the "board of professors" ceased. The professors have pupils varying considerably in proficiency assigned to them; this hinders the simultaneous instruction of several pupils by the same teacher. It is my opinion that if I had four or five pupils fit to be taught together, they would learn three times as much as if they were taught singly; for, besides being a longer time under instruction, they would also be subject to the additional impulse derived from emulation. At present, in the instrumental classes, each pupil is entitled to two half-hours' instruction on his special instrument (besides other instruction) per week.

184. Are they not all taught in classes?—It is generally understood that the teaching should be in classes; but

in many classes I believe the proficiency is so varied as to render it useless for all the pupils to attend at the same time. When I was at Leipsic, under Dr. Mendelssohn-Bartholdy, there were never less than five or six pupils taught by him at a time, extending over not more than two hours. In correcting one pupil he instructed the others at the same time; but in that case the pupils were pretty much on a par with each other. It was a saving of time and trouble to the professor, and a benefit to the pupils.

192. You have instanced Mendelssohn, who did not object to teach five or six in a class, but who probably would not have taught singly?—Yes; and he had the best students, who felt it, of course, an honour to be under him.

194. Will you favour the Committee with your views with respect to there being too many professors in particular branches of music at the Academy, and the insufficient payment made to them?—With regard to the payment I cannot speak about that, as it is a matter of private arrangement.

195. Are you under the impression that the professors are insufficiently paid?—I am. Having observed that there are too many professors, looking at the number of pupils in each branch, I would explain as follows: I would not restrict the number of head professors to one in each department, because, in a city like this, there is an ample supply of first-rate talent from which two or three head professors might with advantage be selected, but there should not, I think, be so many as, for example, ten or twelve different styles of pianoforte-playing in an academy, as the independent teaching of ten or twelve professors might involve. At present there are eight or ten professors, and some sub-professors, of the pianoforte alone. With the exception of one examination a year, and occasional playing with the orchestra, there are no means of publicly testing, within the Academy, the progress of the pupils. I believe there used to be two examinations in the year, which enabled the authorities to follow much better what the pupils did, and the second examination should be resumed. At present no professor is responsible for what is done beyond his own class. If the Academy were divided into departments, according to the different branches of tuition, there would be in the several departments head professors, responsible for the tuition, although carried out through the medium of subordinate teachers.

198. Do we understand the system you recommend to be this—that there should be two or three head professors—say of the pianoforte?—Yes.

199. That under these head professors there should be a certain number of subordinate professors, who should educate the beginners, with the view of their ultimately going into the classes of one of the head professors. For instance, that A should have a certain number of pupils under him; and the same with B, and so on?—Quite so, with this addition; I would make it imperative upon the head professors to see what their juniors do.

200. And they should be responsible for their subordinates?—Yes; and the head professors responsible to the principal and directors. The head professors should receive an annual stipend in virtue of their office, quite independently of the fee for their lessons, whatever that may be.

201. You see no objection to the head professors appointing the sub-professors?—No; I think it well that they should nominate the sub-professors for whom they are to be responsible, assuming this course to be in other respects convenient, the appointment being subject to the principal.

204. You have said you would recommend heads of the different departments; are you of opinion that there should be a principal over the whole Academy, to whom the head professors should be responsible; or do you think it would be better to reconstitute the board of professors and have no principal?—I think there ought to be a principal.

205. As far as you are acquainted with the foreign conservatoires and academies do you know whether they all have principals?—Cologne and Brussels have one, Vienna also had when I knew it. They are very differently constituted. At Leipsic, during my time, Mendelssohn was virtually the principal, though not appointed as such. There was a board of five directors, of whom Mendelssohn was one.

206. Professional directors?—No; not absolutely professional, but gentlemen for the most part well versed in music. Mendelssohn was one of the founders of the Conservatoire at Leipsic, and during his lifetime he was the leading soul of it. I wish to refer the Committee to several allusions to the Leipsic Conservatoire (as well as that projected for Berlin by the late King of Prussia contained in the 2nd volume of Mendelssohn's letters, under dates February 13, 1841; November 23, 1841; April 13, 1843; March 6, 1845; as well as the memorandum of May, 1841 (see Appendix, p. 606).

207. It is stated here (referring to a printed report) that none of the directors of the Leipsic Academy were educated musicians, and the president is a retired lawyer; therefore this report bears out the idea that the directors of that Academy are not necessarily professional musicians.—No; the social relations on the continent being very different to those prevailing in this country, the two systems cannot easily be compared. The retired lawyer spoken of was an intimate friend of Mendelssohn's, who again, was an intimate friend of M. David, the principal violin professor.

208. At the same time you think it desirable that some direction should be exercised by persons having professional status?—I believe it to be more than desirable—necessary. There should be a principal—a professional man, who can give his chief time and energies to the duties.

209. The best man in fact who could be obtained?—Yes; and unfettered by private engagements.

210. Are you of opinion that the fees are what they ought to be?—I have already stated my impression to be that they are not.

211. What do you consider the principal inducement on the part of professors to connect themselves with the Academy? Is there a *prestige* or distinction attached to the teaching at the Royal Academy? With the younger professors I imagine this would be the case. It might be so with many. With all the professors there would doubtless be the satisfaction of seeing the results of their labours in the ultimate proficiency and distinction of their pupils, which they can hardly expect among the amateur pupils.

212. The question as to the fees was intended rather to apply to those paid by the pupils of the Academy. What is your opinion with regard to the fees required from the students?—I think they are higher than a great many pupils can conveniently pay for their instruction.

213. Do you think the amount of the fees sometimes prevents the acquisition of good pupils by the Academy?—I will not say they prevent the acquisition of good pupils, but they no doubt preclude some from entering the Academy at all; in other cases it may lead to students leaving the Academy prematurely. The fees in many cases, I have no doubt, are provided at considerable sacrifice on the part of parents. I have already, on a previous occasion, expressed the opinion that there should be many more exhibitions connected with the Academy than there are at present. There are now only two whole exhibitions and two partial ones. When the Leipsic Academy was founded, in 1842-43, Mendelssohn succeeded to have felt—and I believe some importance is attached by this Committee to the example of Leipsic—that it could not be founded without a public grant. (See the letters alluded to.) About that period a Leipsic exhibition placed, by bequest, at the King's disposal, the sum of 20,000 dollars, to be devoted to some object of art. Mendelssohn succeeded in obtaining that money for the establishment of the Conservatoire, on condition that

exhibitions should be founded, of which there are at the present moment, I believe, ten, the general fee, nevertheless, amounting to no more than one-third of what it is here.

214. Are you in favour of as many exhibitions as possible, subject to proper regulations?—I think they should be fixed in proportion to the number of paying students, say in the ratio of 20 per cent.

215. Do you think it right that students should pay certain fees, or that the education should be gratuitous, as in Paris?—In this country I think fees should be paid.

216. Do you think thirty-three guineas a year too high; or do you think the fees should be varied according to the circumstances of the students?—My impression is that there should be a senior and a junior department, and the fees of the latter should be lower. This regulation has, I believe, been lately adopted at the Royal Academy.

217. By juniors you mean those of inferior musical qualifications?—I mean, as a rule, the younger students. I have been in most of the towns of importance in England, and, excepting the cathedral towns, I think there is no other country in the provinces in which good musical instruction appears so difficult to obtain. Many students come to the Academy either too late or insufficiently instructed; and if there were a junior department in the Academy, and means could be taken for assuring the parents, as far as practicable, of the proper housing of the students from the provinces, they might come earlier to the Academy, and have a better chance of rising in it. There are some few young pupils, but, with these exceptions, the pupils for the most part are somewhat advanced in years in proportion to their attainments.

218. I see in the Academy prospectus there is a junior department with a fee of seven guineas per term—that is twenty-one guineas a year; does not that appear to be rather high? if the fees were lower they would get more pupils?—Under existing circumstances the instruction received by the pupils cannot be obtained for a lower fee, although I consider it highly desirable that it should be lower.

221. Looking to the class of persons who for the most part attend the Academy, what would you say should be the largest fee they ought to pay?—That is a difficult question to answer at once. I presume all the students coming to the Academy come for professional objects; at least that is what we wish if it is the institution it ought to be.

222. You would wish it to be confined to persons intending to pursue music as a profession?—I assume that to be so.

223. Would you like it so?—I assume it would be confined to such.

224. Do you exact any test of competency before you admit a student, with or without payment of fees?—There is an admission test I think now; nevertheless the Academy, in its present condition, can hardly afford to reject pupils for want of qualification.

225. Will you point out the difference between teaching other arts—drawing, for instance—and teaching music?—In class teaching of music it is necessary that the pupils in each class should be pretty much on a par, or else one less advanced keeps back the others; in drawing it would not necessarily be so.

226. We have heard that there are from ten to twelve teachers of the pianoforte in the Academy, all of them, it is to be presumed, good executants themselves. Is it your opinion that because a person is a good performer he must necessarily be a good teacher of the instrument?—I should not say necessarily so.

227. Should you say a person was competent to give instruction on an instrument of which he was not himself master?—I should say, as a rule, not.

228. But how would it be in the case of singing, where many of the best teachers are not remarkable for their vocal powers?—That is the case with some of the masters

of the Academy at the present time; but with regard to instrumental teaching, I consider the teacher ought to be able to play for his pupils all the music that he puts before them.

229. Which foreign institution could, in your opinion, furnish the committee with the most valuable hints as to management?—They would probably each one furnish something that would be useful, but they would require to be adapted to English notions and practices.

230. You mentioned Dresden as a new institution. Do you think that embraces all the recent improvements that have been introduced into the conduct of such institutions?—There are some features in the Conservatoire of Paris which would be the greatest boon to the Royal Academy present or future. One is their excellent band of instrumentalists. The Leipzig Academy is an excellent one. So I understand that of Cologne to be. I belong to the board for awarding the Mendelssohn scholarship in this country, and at a recent election the successful candidate was sent to Leipzig, as the place affording the greatest facilities and stimulus for his further progress.

231. Leipzig was selected in preference to the Royal Academy or any other place?—Yes.

232. You concurred in that individually?—Yes; chiefly on account of the great encouragement given there—the impulse given to the student.

234. Can you direct the Committee to anything worthy of imitation at Vienna?—I do not know it sufficiently of late. My impression is that Paris, Leipzig, and Cologne possess the most thriving conservatoires, and they are ably managed.

236. Do you find the accommodation of the present premises of the Academy all you could wish?—We hear each other in the adjoining rooms, and that is undesirable.

237. You would not object to improved premises?—No; but they should be centrally situated. The present locality, as a centre of the musical portion of London, is a very good one. It may be termed the musical centre of London, being in the neighbourhood of many concert-rooms, and also of the music sellers and instrument makers, not to mention that it is in the neighbourhood of the residences of many of the professors.

238. Looking to your present acquaintance with the musical status of England, do you think it would be in your power to submit to the committee hereafter a plan for the payment of the professors, fees for pupils, and for the extra exhibitions which you would recommend?—Personally I should have no objection to do so; but I do not think it would do any good, and might appear presumptuous on my part.

239. Of what improvements do you consider the system of the Royal Academy of Music susceptible?—I answer—individual opinions and suggestions have been offered before, and the musical world has seemed so divided that no practical good has resulted from those individual plans. My plans would share the fate of those which have gone before.

240. It would help the committee in the consideration of the subject.—I believe I could give my own notion in very few words now.

241. That is assuming adequate funds are forthcoming for the purpose of the Academy?—I would have the tuition of the Royal Academy comprise singing, string instruments, the pianoforte and organ, and wind instruments, harmony, counterpoint, composition, and such further knowledge of the art and history of music as may justly be expected from an institution of this stamp. The tuition should also include the study of church and cathedral music, not to compete with special cathedral education, but as an essential part of a complete musical education. Again, the Academy ought to have a fair instrumental band as an indispensable means of instruction.

242. You mean independently of the students?—If there are not sufficient instrumentalists amongst the students, the orchestra should be supplemented by paid musicians.

243. Is that the case in Paris?—The orchestra of the Conservatoire of Paris is avowedly most efficient. But to return to the Royal Academy. The students being taught composition, and being encouraged to produce specimens of their own proficiency, should be provided with the means of having them decently performed. Further, there should be a proper musical library. Encouragement and stimulus should be given to the pupils by instituting additional exhibitions to be competed for, as well as minor prizes. I would further suggest, as the highest prize, one or two scholarships, to be awarded for not less than two years, to students on leaving the institution, as available either for the purposes of travel or otherwise with a view to further cultivation of the art, free from the necessity of its exercise for self-support.

244. You would leave the professional instruction solely in the hands of professional people?—Yes; certainly; in fact that is indispensable.

245. Would you approve of lay committees and directors?—As a rule. In my opinion a directorship of laymen works very well, and would prove a support to the principal. For the rest I believe that in the earlier part of my evidence, referring to principal, head professors, sub-professors, &c., I have sufficiently indicated the organism by which the plan thus sketched should be worked. And now I wish to add a few words with reference to the status of the Royal Academy. It has been much attacked, and in my opinion its faults have been a good deal exaggerated. My own impression is that, though of late years it may have been at a rather low ebb, the present directors and all connected with it are doing their best to raise and improve it, and that there is decidedly an upward movement. Whatever the faults of the Royal Academy may be, and I have no doubt it has some, I am certain that, with alterations of the nature already described, it would command the confidence of the country in a greater degree than could be expected of any new institution. I have found by personal experience the best professors of music in the large towns to have been students of the Royal Academy. The main object of the Institution, as I apprehend it, is not so much to produce individual instances of conspicuous attainment as a comparatively numerous body of well-instructed and competent musicians. In this the Royal Academy has hitherto been to a considerable extent successful, and I am not aware of any other institution of the kind in this country of which so much can be said. A list has been prepared (which is given below) comprising many of the principal towns of the United Kingdom, in which, as already mentioned, the chief professional musicians are known to have been students of the Royal Academy; and while, with regard to them, it may fairly be presumed that they entertain a kindly feeling to the Institution where they have pursued their studies, it is obvious that, with the developed efficiency which an amended organisation would secure, the Academy would rise in their opinion, and, thus strengthened by their increased support, would command the confidence of the country at large.

APPENDIX.

LIST OF FORMER STUDENTS OF THE ROYAL ACADEMY OF MUSIC, NOW ESTABLISHED IN THE COUNTRY AS PROFESSORS:—

Aberdeen—W. Adlington, pianoforte and vocalist; R. Latter, vocalist and pianoforte; R. H. Baker, pianoforte, and org. St. Andrew's.

Bath—J. K. Pyne, vocalist, pianoforte, org. the Abbey.

Belper—C. Batchelor, pianoforte.

Birkenhead—E. Ganton, pianoforte, org. St. John's; S. Percival, pianoforte.

Birmingham—Mrs. Baker, vocalist and pianoforte.

Blackheath—W. Latter, pianoforte.

Bradford—J. Burton, pianoforte; Miss Freeman, pianoforte and vocalist.

Brighton—C. Goodban, Mus. Bac., pianoforte.

Bristol—Miss Pilling, vocalist and pianoforte.

Bury St. Edmunds—J. Reeve, pianoforte.

Cardiff—J. Wilkes, pianoforte.

Cheltenham—M. Von Holst, pianoforte and vocalist.

Chester—A. Sapio, vocalist and pianoforte.

Deal—J. Harrison, pianoforte.

Dewsbury—T. Burton, pianoforte.

Dublin—F. Hoffman, pianoforte.

Exeter—W. Baly, pianoforte, org. St. Leonard's.

Glasgow—A. C. Johnson, pianoforte; J. Thomes, pianoforte, org. Glasgow Cathedral.

Gloucester—T. Goodfellow, pianoforte, org. Philharmonic Society; A. W. Wheeler, pianoforte.

Greenwich—Miss La Feuillard, pianoforte and harp.

Hanley—T. Chantry, pianoforte.

Harrow-on-the-Hill—J. B. Turner, pianoforte.

Hillsboro' (Belfast)—Mrs. E. B. Harper, pianoforte and vocalist.

Heversham—R. T. Wilson, pianoforte.

Iale of Man—J. Barber, pianoforte; H. Canan, pianoforte (bandmaster); D. Reeve, pianoforte.

Iale of Wight—S. Shaw, pianoforte (Ryde).

Ipswich—R. L. Nunn, pianoforte.

Leeds—J. W. Pew, pianoforte; J. W. Sykes, pianoforte.

Leicester—Miss Deacon, vocalist and pianoforte.

Liverpool—B. R. Isaac, pianoforte; S. Percival, pianoforte; W. Streather, pianoforte; E. W. Thomas, pianoforte and violin; C. J. Toms, harp and pianoforte.

Macclesfield—Miss H. Condron, vocalist and pianoforte; G. Gee, pianoforte.

Manchester—C. Bloxsome, vocalist and pianoforte; C. A. Seymour, pianoforte and violin; J. Wright, pianoforte.

Marlboro'—W. S. Bambridge, pianoforte, org. College.

Newcastle-on-Tyne—Miss Larbaestier, vocalist and pianoforte.

Newcastle-under-Lyne—T. Mason, pianoforte.

Northampton—C. McKorkell, pianoforte and org. A. Saints; Miss McKorkell, harp and pianoforte; W. Packer, pianoforte.

Penzance—J. H. Nunn, pianoforte.

Pershore—Miss Tovey, vocalist and pianoforte.

Plymouth—F. Burford, pianoforte; T. E. Weeks, pianoforte; S. Weekes, pianoforte.

Poole (Dorset)—Miss Churchill, pianoforte and vocalist.

Ramsgate—Miss F. Martin, pianoforte.

Salisbury—Miss L. Aylward, vocalist and pianoforte; C. J. Read, pianoforte.

Shrewsbury—Walter Hay, pianoforte.

Southwell (Notts)—J. C. Stone, pianoforte.

Southsea—C. J. Mew, pianoforte.

Taunton—J. Pridham, pianoforte and vocalist.

Torquay—T. Brooks, pianoforte; C. Fowler, pianoforte.

Weston-super-Mare—W. H. Palmer, pianoforte.

Wimborne—J. W. Smith, pianoforte and org. Minster.

Windsor—Miss Kellner, vocalist and pianoforte.

Wolverhampton—G. Wheeldon, pianoforte.

Woolwich—Miss Whomes, pianoforte and vocalist.

Worcester—Miss D'Egville, vocalist and pianoforte; R. Mason, pianoforte.

York—E. White, pianoforte.

LETTERS FROM MENDELSSOHN REFERRED TO IN ARTICLE No. 206.

To Paul Mendelssohn Bartholdy.

Leipzig, February 12th, 1865.

The Berlin affair is much in my thoughts, and is subject for serious consideration. I doubt whether it will ever lead to that result which we both (I believe)

would prefer; for I still have misgivings as to Berlin being a soil where a person of my profession could feel even tolerably at home, in spite of all honours and money, but the mere offer in itself gives me an inward impulse, a certain satisfaction, which is of infinite value to me, even if I were never to speak of it to any one; in a word, I feel that an honour has been done me, and rejoice in it. Massow writes in his last letter, which received before yours, that the King wishes to delay the definite arrangements of the Academy till I go to Berlin in spring; whether I choose to make proposals by writing as to the alterations of the statutes which he sends me, he leaves entirely to my own decision. As the point is left to myself, and I would far rather not write at all on the subject, I shall delay doing so till I now to a certainty whether I go to Berlin in spring or not, and only in the latter case write. Remarkable, yet remarkable, these statutes are, especially those of the school for composition. Imagine! out of eleven different branches of instruction which they have instituted, seven are positively useless, and indeed preposterous. What do you think of the following, among others? No. 8. "The relation Music bears to the other arts, especially to the plastic and to the age;" and also No. 11, "A guide to the spiritual and worldly Drama." I formerly read these things in the Government paper, and laughed at them; but when a grave minister or official actually sends such stuff, it is pitiable. Pray do go to some public place where newspapers are collected, and send me the one which advertises this course, and where the teachers of the different branches are named. I require these data thoroughly to understand the affair. It is all in the most possible state; you will say this is the very reason why I should try to extricate it. In that case there could indeed be plenty to do, if I could only think myself a man to do it; to improve what is already good, or to create what is new and good, would be an undertaking in which I should rejoice in, and which might be learned, even if there were no previous knowledge of the subject; but to change what is positively bad into better things, is both a hard and a thankless task.

To Carl Klingemann, London.

Leipzig, Nov. 23rd, 1842.

* * * The following are the plans which the King outlined at full length; first of all, to form a kind of *al capelle*, that is, a select choir of about thirty very first-rate singers, and a small orchestra (to consist of the best of the theatrical orchestra); their duties to consist in church music on Sundays and at festivals, and besides in performing oratorios and so forth; that I was to rect these, and to compose music for them, &c., &c. Certainly," said I, "if this had ever been mentioned, it could only be accomplished; this being the very point at issue which I had found wanting." On which he replied again, that he knew perfectly well I must have an instrument to make music on, and that it should be my care to procure such an instrument of singers and players; but when he had procured it, he must know at I was prepared to play on it; till then I might do as I liked, return to Leipzig, or go to Italy—in short, be entirely unfettered; but he must have the certainty that I might depend on me when he required me, and this could only be ensured by my remaining in his service. He was at least the essential substance of the whole of our conversation; we then separated. * * * I went to Dresden a few days after my return, thanked the King once more, and entreated him not the less to stow the twenty thousand thalers (which an old Leipzig left in his will at the disposition of the King: an Academy of Art) to found a school for music in Leipzig, to which he graciously acceded. The official nouncement came the day before yesterday. The new school is to be organised this very winter, at least its chief features; when it is established, I may well

say that I have been the means of procuring a durable benefit for music here.

To I. Moscheles, London.

Leipzig, April 13th, 1843.

* * * Our Music Academy here has made a famous beginning; fresh notices of students arrive almost daily, and the number of teachers, as well as of lessons, have been necessarily very much increased.

Two serious maladies, however, are apparent, which I mean vigorously to resist with might and main so long as I am here: the direction is disposed to increase and generalise,—that is, to build houses, to hire localities of several stories,—whereas, I maintain that for the first ten years, the two rooms we have, in which simultaneous instruction can be given, are sufficient. Then all the scholars wish to compose and to theorise, while it is my belief that vigorous practical work, thorough steady practising, and strict time, a solid knowledge of all solid works, &c., &c., are the chief things which can and must be taught. From these, all other knowledge follows as a thing of course, and anything further is not the affair of learning, but the gift of God. I need not however, I am sure, say that notwithstanding this, I am far from wishing to render Art a mere handicraft.

To Minister Eichhorn, Berlin.

Frankfort-on-the-Maine, March 6th, 1845.

I must first of all thank your Excellency for the flattering proof of confidence contained in the letter I have received from your Excellency, and also for your wish to hear my opinion in so important a matter. That the reform of the Academy of Arts and its musical section, which your Excellency refers to in your letter, will be of the greatest value to the whole musical condition of Berlin, does not admit of the smallest doubt. Your Excellency informs me that it is your intention to effect this by placing a composer at the head of the musical section, to be a guiding star to the pupils by his own energetic creative powers, like the master of the *atelier* in the plastic arts, and you do me honour to mention my name on this occasion, or in the event of my being prevented accepting this offer, you commission me to point out one of my colleagues in art whom I consider best suited for such a situation. But in order to form a decided opinion on the matter, I must beg for an explanation of various points which, in this and every other affair of the same kind, appear to me the most important, and before which all personal questions must meanwhile retire into the background.

Is the reform which you have in view in the musical section, to consist solely in the appointment of such a composer, and the musical section to continue in the same shape as formerly? If this be the case, what relation will such a director assume to the former members of the senate or section, and to the director of the whole Academy? Is the distribution of the different branches of instruction to remain the same, or is a reform proposed in this respect also? In what precisely does the practical efficacy of such a teacher consist? It is not possible to show the act of composition, as the master in an *atelier* does the design of a picture or the form of a model, and according to your Excellency's words, an intellectual influence is what is chiefly required. Such an influence, according to my conviction, is however only to be obtained in the School of Art, when the whole course of instruction has already laid a sound foundation, when all the teachers in their positive departments strive towards the same point, when no actual deficiency is anywhere overlooked in education, and finally, when, as a key-stone, all the corresponding impulses of this teaching are at once combined and placed before the scholars in their practical application, and thus more strongly impressed on their minds. In this sense I could well imagine such a new active situation

fruitful for good and for influence; but it seems to me that for this purpose it is not merely the situation itself which is to effect it, but in reality a reform of the whole inner constitution of the Academy; and I do not know whether this enters into your Excellency's views, or indeed be within the range of possibility. Without this, the position, though undoubtedly highly honourable, would be devoid of all real, practical utility; a merely general excitement, however great, can at best only call forth an unfruitful enthusiasm in the minds of the scholars, if indeed it calls forth anything whatsoever. The teachers of positive subjects alone would, in such a case, acquire a real and decided influence on the development of young artists; the professor at the head, influencing only by example, would, on the other hand, be like a mere airy phantom, and the connection between the head and the limbs fail, without which neither the head nor the limbs can live or thrive.

If your Excellency will be so good as to give me some more precise information on this matter, I shall then be in a position to form a clearer view of the affair itself, as well as of the personal questions connected with it; and I shall esteem it my duty, on this as on every other subject, to state my opinion candidly to your Excellency.*

Memorandum by Mendelssohn, on the subject of a Music Academy to be established at Berlin.

Berlin, May, 1841.

It is proposed to establish a German Music Academy in Berlin, to concentrate in one common focus the now isolated efforts in the sphere of instruction in art, in order to guide rising artists in a solid and earnest direction, thus imparting to the musical sense of the nation a new and more energetic impetus; for this purpose, on the one side, the already existing institutes and their members must be concentrated, and on the other, the aid of new ones must be called in.

Among the former may be reckoned the various Royal academies for musical instruction, which must be united with this musical Academy, and carried on as branches of the same, with greater or less modifications, in one sense and in one direction. In these are included, for example, the Institute for Elèves of the Royal Orchestra; the Organ Institute; that of the Theatre (limited to the theatre alone) for instruction in singing, declamation, &c. Further the members of the Royal *Capelle* must be required to give instruction on their various instruments. A suitable locality can no doubt be found among the Royal buildings, and also a library, with the requisite old and new musical works, scores, and books.

The new appointments to consist of—

1. A head teacher of composition; the best that can be found in Germany, to give regular instruction in theory, thorough-bass, counterpoint, and fugues.
2. A head teacher of solo singing; also the best to be had in Germany.
3. A head teacher of choral singing, who should strive, by his personal instructions, that the scholars under his care should be distinguished by good pianoforte playing and steady direction.
4. A head teacher of pianoforte-playing, for which office a man of the most unquestionable talent and reputation alone must be selected. The other teachers for these departments could be found in Berlin itself; nor would there be any difficulty in procuring teachers of aesthetics, the history of music, &c.

The complete course to last three years; the scholars, after previous examination, to be instructed gratis; no prize works to be admitted; but at stated periods all the works of the scholars, from the time of their admission, to be collected and criticized in connection with each other, and subsequently a prize (probably consisting of a

sum sufficient for a long journey through Germany, Italy, France, and England) to be adjudged accordingly. Every winter a certain number of concerts to take place, in which all the teachers (including the above-named members of the Royal *Capelle*) must co-operate, and by which, through the selection of the music, as well as its execution, direct influence may be gained over the public at large.

The following principle might serve as a basis for the whole Institute: that every sphere of art can only elevate itself above a mere handicraft, by being devoted to the expression of lofty thought, along with the utmost possible technical finish, and by a pure and intellectual aim; that consequently solidity, precision, and discipline in teaching and learning, should be considered the first law, thus not falling short in this respect of a handicraft; but that at the same time, in every department, all teaching and learning should be exclusively devoted to the expression of the aforesaid thoughts, and to that more elevated mood to which technical perfection in art must ever be subordinate.

EXAMINATION PAPERS, 1865.

(Continued from page 595.)

The following are the Examination Papers set in various subjects at the Society's Final Examinations, held in April, 1865:—

ENGLISH LITERATURE.

THREE HOURS ALLOWED FOR THE TWO AUTHORS SELECTED BY THE CANDIDATE.

SHAKESPEARE.

(MACBETH.—HENRY V.—THE TEMPEST.)

I.

1. State the connexion in which each of the following passages occurs, explain every allusion, and notice any unusual words and grammatical constructions:—

- (a) The sin upon my head, dread Sovereign!
For in the book of Numbers is it writ—
When the man dies, let the inheritance
Descend unto the daughter.
- (b) The sin of my ingratitude even now
Was heavy on me: thou art so far before,
That swiftest wing of recompense is slow
To overtake thee. 'Would thou hadst less done:
That the proportion both of thanks and payment
Might have been mine! only I have left to say
More is thy due than more than all can pay.
- (c) The slave, a member of the country's peace,
Enjoys it; but in gross brain little wots
What watch the king keeps to maintain the peace—
Whose hours the peasant best advantages.
- (d) ————Sitting on a bank,
Weeping again the king my father's wrack,
This music crept by me upon the waters.
- (e) ————More will I do,
Though all that I can do is nothing worth,
Since that my penitence comes after all,
Imploring pardon.
- (f) You are three men of sin, whom destiny
'That hath to instrument this lower world,
And what is in it) the never-surfeited sea,
Hath caused to belch up you, and on this island
Where man doth not inhabit.
- (g) ————Now does he feel
His secret murders sticking on his hands;
Now minutely revolts upbraids his faith-breach:
Those he commands move only in command,
Nothing in love; now does he feel his title
Hang loose about him, like a giant's robe
Upon a dwarfish thief.

* This communication led to no results.

2. Turn the passages *a* and *b* into plain prose.
3. Explain the expressions—"the shales and huaks of men"—"the Mediterranean flote"—"the law Salique"—"kernes and gallow-glasses"—"the still-veged Bernothies."
4. Give some account of the Chorus in Henry V.

II.

1. Briefly sketch the plot of the first act of Henry V., of the third act of Macbeth.
2. From what historical sources did Shakspeare take the plots of Henry V. and Macbeth? In what particulars has he deviated from historical authority?
3. What do you know of the sources of the text of these three plays?
4. Give some account of Shakspeare's life while he resided in London.

REED.

INTRODUCTION TO ENGLISH LITERATURE.

1. Which are the peculiar advantages of the English language compared with most other languages? Why are native Saxon words to be generally preferred to words of foreign origin?
2. Give some account of the process by which the English language has been formed.
3. Explain the distinction between *shall* and *will*.
4. "If Chaucer was unfortunate in the period of his country's language, he was happy in the era of his country's history." Explain this statement. Sketch the plan of the Canterbury Tales.
5. What place in the history of English prose literature does Mr. Reed assign to Richard Hooker? What do you know of Hooker's great work?
6. Give some account of Comus, or of Lycidas.
7. Express briefly the substance of Mr. Reed's remarks on Sunday reading. What are his objections to the Paradise Lost? Do you agree with them?
8. Name the great essayists of the time of Queen Anne, with their principal works. Give some account of the Spectator.
9. What was the effect of the French Revolution, and of the causes which led to it, upon literature, and upon English literature in particular?
10. What is the predominating tendency of the poetry of Wordsworth? What do you know of "The Excursion?"
11. What English authors have shown the faculties of Wit and Humour to the greatest advantage? What are the chief abuses to which those faculties are liable?
12. What are the characteristics of a true letter? Who are the best writers of letters in our language? What are the chief faults in Pope's letters?

BUTLER.

THE ANALOGY.

I.

1. How is probable evidence distinguished from demonstrative evidence? How does Butler illustrate the distinction?
2. "Nor can we find anything throughout the whole analogy of nature to afford us even the slightest presumption that animals ever lose their living powers." Briefly sketch the train of reasoning into which these words are introduced.
3. What are *final causes*? In what way may the existence of an intelligent Governor of the world be proved from them?
4. How does Butler refute the notion that "things may be now going on throughout the universe, and may on hereafter, in the same mixed way as here at present on earth—virtue sometimes prosperous, sometimes depressed; vice sometimes punished, sometimes successful?"

5. Explain the distinction between *passive habits* and *active habits*. In what way does this subject bear upon the line of argument?

6. In what sense does Butler say we are to understand "that general assertion, that the opinion of necessity is essentially distinctive of all religion?"

7. By what arguments is the objection to Christianity met, that it has done but little to improve the world?

8. State the distinction between moral precepts and positive precepts, and give examples.

9. Which are the main arguments, on which Butler founds the credibility of a revealed religion?

II.

1. Sum up, as briefly as you can, the author's purpose in the first part of the Analogy.

2. Which are the main objections that have been urged against arguing from the analogy of Nature to Religion? In what way may they be answered?

3. Give some account of Bishop Butler. Name his other works besides the Analogy.

MILTON.

PARADISE LOST.—BOOK I.—VI.

I.

1. In what connexion does each of the following passages occur? Explain every allusion, and notice any unusual words or grammatical constructions which occur in them:—

(a) ———Not that fair field
Of Enna, where Proserpine gathering flowers,
Herself a fairer flower, by gloomy Dis
Was gathered, which cost Ceres all that pain
To seek her through the world.

(b) ———As when by night the glass
Of Galileo, less assured, observes
Imagined lands and regions in the moon:
Or pilot, from amidst the Cyclades,
Delos or Samos first appearing, kens
A cloudy spot.

(c) This inaccessible high strength, the seat
Of Deity supreme, us dispossessed,
He trusted to have seized.

(d) O, for that warning voice, which he who saw
The Apocalypse heard cry in heaven aloud;
Then when the dragon, put to second rout,
Came furious down to be revenged on men,
"Woe to the inhabitants on earth!"

(e) High on a throne of royal state, which far
Outshone the wealth of Ormus and of Ind,
Or where the gorgeous East with richest hand
Showers on her kings barbaric pearl and gold,
Satan exalted sat—

(f) ———Anon they move,
In perfect phalanx, to the Dorian mood
Of flutes and soft recorders.

2. Give a short account of Satan's passage from hell to the earth.

3. Servant of God, well done; well hast thou fought
The better fight, who single hast maintain'd
Against revolted multitudes the cause
Of truth: in word mightier than they in arms;
And for the testimony of truth hast borne
Universal reproach, far worse to bear
Than violence; for this was all thy care,
To stand approved in sight of God, though worlds
Judged thee perverse: the easier conquest now
Remains thee, aided by this host of friends,
Back on thy foes more glorious to return,
Than scorn'd thou didst depart.

- (a) Give the sense of this passage in plain prose, adding as little as possible to the number of words.
 - (b) To whom is it addressed, and on what occasion?
 - (c) Notice any unusual expressions contained in it.
4. Briefly sketch the substance of Satan's address to the sun, or of Milton's address to light.

II.

1. What personal allusions to the poet himself, or his contemporaries, occur in the *Paradise Lost*?
2. Give some account of Milton's life, and especially of the circumstances under which the *Paradise Lost* was written.
3. What do you know of Milton's prose works?

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, 1865.

The thirty-fifth meeting will commence in Birmingham, on Wednesday, the 6th of September next, under the presidency of John Phillips, Esq., M.A., LL.D., F.R.S., F.G.S., Professor of Geology in the University of Oxford. The general secretaries are William Hopkins, Esq., M.A., LL.D., F.R.S., St. Peter's College, Cambridge, and Francis Galton, Esq., M.A., F.R.S., F.G.S., 42, Rutland-gate, Knightsbridge, London; the assistant general secretary is George Griffiths, Esq., M.A., Professor of Experimental Philosophy in the University of Oxford, 5, Park-villas, Oxford; the local secretaries for the meeting at Birmingham are William Mathews, Esq., jun., F.G.S., John Henry Chamberlain, Esq., and the Rev. G. D. Boyle, M.A., Christ Church-buildings, Birmingham; and the local treasurer is William Holliday, Esq.

The following are the arrangements:—

The General Committee will meet on Wednesday, the 6th of September, at one p.m., for the election of sectional officers, and the despatch of business usually brought before that body. On this occasion there will be presented the report of the Council, embodying their proceedings during the past year. The General Committee will meet afterwards by adjournment.

The first general meeting will be held on Wednesday, the 6th of September, at eight p.m., when the President will deliver an address; the concluding meeting on Wednesday, the 13th of September, at three p.m., when the Association will be adjourned to its next place of meeting.

At two evening meetings, which will take place at eight p.m., discourses on certain branches of science will be delivered.

There will also be other evening meetings, at which opportunity will be afforded for general conversation among the members.

The committees of sections will meet daily, from Thursday, the 7th of September, to Wednesday, the 13th of September inclusive, at 10 a.m. precisely.

The sections will meet daily, from Thursday, the 7th of September, to Tuesday, the 12th of September inclusive, at 11 a.m. precisely.

Reports on the progress of science, and of researches entrusted to individuals and committees, and other communications intended for presentation to the sections, are expected to be forwarded in letters addressed to the Assistant-General Secretary, at Birmingham, previous to the meeting, accompanied by a statement whether the author will be present, and on what day, so that the business of the sections may be satisfactorily arranged.

The reports complete, and concise abstracts of other communications, are to be delivered to the secretaries of the sections before which they are read, previously to the close of the meeting, for publication in the Transactions.

The following are the titles of the sections to which communications may be presented:—

Section A. Mathematics and physics.

Section B. Chemistry and mineralogy, including their applications to agriculture and the arts.

" C. Geology.

" D. Zoology and botany, including physiology. Sub-section D.

" E. Geography and ethnology.

" F. Economic science and statistics.

" G. Mechanical science.

Until September 2nd, life members who intend to be present at the meeting may receive their tickets by applying to the general treasurer, and returning to him their life member's invitation circular; annual subscribers who wish to receive their tickets, must return their invitation circular, with £1 enclosed, to the general treasurer, W. Spottiswoode, Esq., 50, Grosvenor-place, London, S.W.

The executive committee at Birmingham will entertain new members and associates, on the usual condition.

Gentlemen who have in any former year been admitted members of the Association, may, on this occasion, renew their membership, without being called upon for money, on payment of £1.

After September 2nd, personal application for tickets must be made at the reception-room, Birmingham, which will be opened on Monday, September 4th.

ANGLO-FRENCH WORKING CLASSES EXHIBITION.

This Exhibition, in support of which it will be remembered that a meeting was held in the Society's room six months since, presided over by Mr. W. Hawes, Chairman of the Council, was opened on Monday last, the 7th inst. at the Crystal Palace.

Mr. Herbert Mandalay, of the firm of Mandalay & Field, having taken the chair, the ceremony of opening the Exhibition was commenced with prayer, the Rev. J. A. Emerton officiating.

The secretary, Mr. R. Coningsby, read a letter from Mrs. Cobden, expressing her regret at being unable to accept the invitation to attend the opening, and saying that had her husband been living, "he would have given earnest sympathy and support to an exhibition designed to promote the cause—always so dear to his heart—international peace and goodwill, and so honourable to the men by whom it was originated, and by whom it was being carried out." Mr. Coningsby said that the present Exhibition was an experiment, and that next year he hoped not only that the scheme as it at present stood would be enlarged, but that it would extend itself to an Anglo-French American Exhibition. One of the French secretaries, M. Edmond Potonié, editor of *L'Assommoir*, rose, and said that while he was obliged to speak in that day to an English audience, he hoped that an Englishman would soon be talking to a French audience on the same subject; and more, that a world-wide extension of their ideas might set many nations talking to one another. He bore earnest and eloquent testimony to the heartiness with which the proposal of this Exhibition had been received by the workmen of Paris. He spoke of his followers M. Potonié, and among them M. Tallandier. When all the addresses had been delivered the Exhibition was declared by the chairman to be open, and the band of the Crystal Palace Company played "God save the Queen."

The display occupies one of the galleries of the Crystal Palace, approached by the stairs on the north of the East Orchestra. It is not yet complete, several important contributions being expected from Paris, and a second enlarged edition of the catalogues being promised. At present there are the names of fifty-three French exhibitors, thirty-five of whom are Parisian, and not all of them belonging to the artisan class pure and simple. The total number of visitors to the Palace on this occasion was 12,370.

ROYAL SCOTTISH SOCIETY OF ARTS.

The following is an abstract of a paper entitled, "Suggestions for extending the use of the Mariner's Compass, so as to take more complete advantage of its powers, and thereby increase the safety of life and property at sea," read before the above society on the 10th July, by Mr. Neil Stewart.

The aim of Mr. Stewart's suggestions is to show that the safety of life and property at sea would be increased by every seaman having from the Board of Trade, or other competent authority, a certificate of the state of his vision at different stages of his life, which would show his competency for particular duties. One instance is shown of a steersman whose shortness of sight rendered him unfit for his duty, and Mr. Stewart thinks that collisions at sea and shipwreck in foggy weather may not unfrequently arise from defective vision on the part of seamen, as there are men of all grades who discontinue to wear spectacles when they first require them, and as sailing in the teeth of the wind, as steamers frequently do, is calculated to impair the sight of seamen rapidly.

That every binnacle should be furnished with lenses, capable of showing the minutest pointing of the compass, for the speed now attained by steamships, with a very slight inaccuracy in steering, might, in a few hours' sailing, carry a ship as many miles out of her course as brought the *Anglo-Saxon* to destruction on Cape Race. Then, in order to make sure that every ship-captain would be made aware of the state of his ship's compass after the stowage of the cargo, and that passengers, shippers, and the public generally would feel assured that life and property would be duly protected against the mis-directed zeal of contending interests, Mr. Stewart suggests that the pilot should be accompanied by an assistant or junior pilot, capable of reading the compass accurately, so that, while the senior pilot would, during the ship's departure, lay her accurately upon certain definite courses, taking the line of the wharf as the first, the junior pilot, furnished with schedules of departure on which the pilot's courses would be printed, would note the marking of the ship's compass abreast of the true courses, so that any difference betwixt them would be seen at a glance. Then of this schedule the junior pilot would fill up a duplicate, so that before leaving the ship the pilot would put his signature to one of the schedules and present it to the chief officer on board, who would sign the other, which the pilot would bring ashore for after reference should be required.

After the foregoing precautions had been taken, however, a ship might encounter severe weather, and suffer such injury as might make reliance upon the compass doubtful. Against such a case Mr. Stewart suggests the following plan for testing the compass at sea:—Two water-buckets should be filled and suspended from the head or stern of the ship, as widely apart as possible, clear of the water, clear of the ship, and at right angles to her middle line. Then two boats (if convenient, but one might do) should leave the ship in opposite directions, and the positions where the two buckets would appear as one. Each boat should be supplied with a compass, over and over which a small brass rod had been elevated, having in its upper side a groove from end to end. The man in charge of the compass would raise the instrument to his eye, and looking along the groove in the brass rod, order the adjustment of the boat's position until the two buckets seen as one would seem to hang into the groove. Then would be the moment for a signal from one or other of the boats, that the marking of the ship's compass might be noted along with that in either of the boats, when the difference, if any, would be seen. This experiment repeated with the ship in other positions would ensure the captain of the state of his compass, when he would be able to prosecute the remainder of his voyage comparative safety.

Fine Arts.

FRENCH ACADEMY.—The Paris Academy of Fine Arts has elected M. Cavalier, the sculptor, to fill the chair left vacant by the death of M. Duret. The new member of the Academy is a very eminent artist; one of his most extensively known works is a seated figure of Penelope sleeping, which has been reproduced in bronze, and largely circulated; the original is the property of the Duc de Luynes, which is at Dampierre. The statue of Blaise Pascal, in the arcade of the Tour Saint Jacques, near the Hôtel de Ville, is also the work of M. Cavalier.

ACADEMY OF ARTS, LYONS.—This Academy, in order to arouse the patriotism of its citizens and to encourage art, had offered a gold medal of the value of £60 for the best history of painting, sculpture, architecture, and engraving in Lyons, from the *renaissance* to the present day. The manuscripts are to be sent in before the end of next year.

ART COPYRIGHT IN FRANCE.—The laws of France, and the spirit in which they have been administered, especially during the last few years, are highly favourable to rights of property in works of arts; and, at the same time the infringements of those laws are more frequent than would be expected under the circumstances. The case of a complaint brought by M. Salvatore Marchi, of Paris, a producer of statuettes and other art objects, against M. Laurent d'Alfonso, of Bordeaux, a dealer in such works, offers some points of interest. It appeared that the defendant had purchased pirated copies of the plaintiff's productions, and that some of them had been seized in his possession. The defendant was not proved to have been the producer of the illicit copies, and the court of Reole acquitted him, but ordered the confiscation of the copies seized. M. Marchi appealed to the Imperial Court of Bordeaux, which reversed the decision of the lower court. It was decreed that the defendant, by his knowledge of the class of works referred to—religious art—in consequence of former dealings with the appellant, and, probably, by the receipt of catalogues and lists published by the latter, could not be ignorant of the fact that the images which he had sold in large quantities to the dealers of Verdélais were illicit copies of the appellant's productions; and the fineness of their execution must have told him that they could not have been the work of the Italian modellers, of whom he declared he had purchased them, but must have been produced by more able hands; the Imperial Court, therefore, declared him to have been guilty of selling and offering for sale pirated works, to the injury of the appellant, and condemned him to pay a fine of 200*fr.*, 500*fr.* damages, and all expenses.

Manufactures.

THE "FIELD" BOILER.—This boiler consists of a vertical cylindrical steam and water space, having a circular flue passing up through its centre, and numerous water tubes passing from its lower plate into the furnace, which is surrounded by a water casing. These tubes are closed at their lower ends, but open at top to the main body of the boiler. Within them are freely suspended other tubes, of smaller diameter, open at both ends, and extending somewhat above the upper extremities, but not quite to the lower ends, of the outer tubes, the tops of the inner or circulating tubes being fitted with suitable deflectors, for preventing the interference of the ascending with the descending currents. On the fire being lighted, the gravity of the water in the annular spaces between the inner and the outer tubes becoming less than that of the water in the central tubes, rises towards the main body of the boiler, cooler water simultaneously descending the inner tubes to supply its place. The rapidity of circulation increases in direct proportion to the heat to which the tubes are submitted, the consequence being that, how-

ever intense the heat in the furnace may be, it is nevertheless fully absorbed by the water in the boiler, the temperature in the chimney rarely exceeding from 650 to 700 degrees. To prevent heat going direct up the central flue, instead of first passing among the tubes, and being properly absorbed, a cast-iron baffle is suspended over the centre of the fire, just below the entrance to the flue, so that the flame is deflected and compelled to pass among the tubes before entering the chimney. These boilers are said to be very effective, while the saving in space, as compared with Cornish boilers of equal power, is considerable.

GAS FROM REFUSE OF APPLES.—The *Nouvelliste* of Rouen announces that a great problem has been solved with respect to cheap lighting, Messieurs Gouverneur, De Butter, and Eichelbremer, of Nogent-le-Rotrou, in the department of the Eure-et-Loire, having discovered a means of obtaining gas from the refuse of apples and pears, after the making of cider and perry, with the aid of very inexpensive apparatus, that is to say, with a portable furnace and still head, a second piece, which performs the functions of condenser, washer, and purifier of the gas, and a gasometer. Each charge yields five hundred litres, or half a cubic metre of gas, or at the rate of a hundred and seventy metres per ton of the refuse. The heat required for the distillation is said to be 200° centigrade, or just one-sixth of that required for coals. The advantages claimed for the gas are, that it does not contain sulphur, burns without any odour, has no effect on paint or gilt work, and possesses more illuminating power than coal gas. It is said that several manufacturers in the Eure-et-Loire have already availed themselves of the invention, and that the farmers are delighted with the prospects of converting the apple and pear trash, a most unpleasant and hitherto useless refuse, into gas or money. The invention, if successful as stated, will doubtless be turned to account,

Commerce.

COMMERCE OF FRANCE.—The returns published for the first half of the current year show an increase in the total amount of imports, the figures being equal to £50,446,440 for 1865, against £47,296,600 in 1864, and £47,300,600 in 1863. Cotton represents £7,508,320; silk, £4,326,640. The exports for the half-year are equal to £55,316,160, being £2,789,280 less than during the first half of last year, but superior to those of 1863, or any former year. The chief items in the list of exports are silks, £6,680,000; woollens, £6,040,000; wine, £4,980,000.

Tobacco in France.—The revenue derived from tobacco in France forms, as in England, one of the most important items in the national accounts. The official returns for 1862, which have recently been published, show a net profit on that article approaching seven millions sterling. The amount sold was 28,300 tons, of which one-third was in the form of snuff, the quantity consumed per head on the average for the whole population being rather over a pound and a half. In some districts it amounted to nearly five pounds per head, while in others it did not exceed ten ounces. The whole of the manufacture is conducted by the Government, which has nineteen establishments; eight directions for the reception and storing of the foreign raw material—at Lille, Strasbourg, Havre, Morlaix, Bordeaux, Tonning, Nice, and Marseilles; seven manufactories—at Paris, Bercy, Dieppe, Nantes, Châteauroux, Lyons, and Toulouse; and three establishments for the superintendence and storing of home-grown tobacco—at Metz, Vesoul, Cahors, and Algiers. The gross amount which passed through the Government manufactories during the year above named was nearly a hundred thousand tons. The capital employed in building, machinery, plant, and utensils of the Government establishments is given at £1,160,000, the average working expenses at £468,148 per annum. The dust

produced in the factories is sold for purposes of fumigation, the powder being mixed with water in which sheets of coarse absorbent paper are steeped, and afterwards rolled and partially dried; when required for use they are laid upon the plate of a stove, in hot-houses or other places infected with insects. The tobacco water is used by cultivators as a means of stimulating the soil. A great deal of science and care is employed in the manufacture of tobacco in France, and the young men employed in the superior processes are drawn exclusively from the Polytechnic school.

SUPERIOR SCHOOL OF COMMERCE, PARIS.—The annual examination of this new and excellent establishment, which has already been mentioned in the *Journal*, was just taken place, and the medals distributed by M. Boursuille, Secretary-General to the Minister of Commerce, who was prevented being present. The president was supported by the members of the council appointed to watch over the progress and study the means of improving the arrangements of the school, amongst whom were Messieurs Michel Chevalier, Emile Pèrre, Wolowski, Pelligot, Persos, Arles Dufour, and other well known names. In his address, M. Boursuille said that the administration had, under instructions from the Emperor, commenced a rigorous inquiry into the condition of professional instruction in France, that in that inquiry commerce had not been forgotten, and that the report of the commission on the new school was highly favourable. The school is not yet large, the number of diplomas granted this year being only eight, and of the medals eight, but its importance is not to be measured, at present at any rate, by the number of its scholars. Amongst the awards were a gold and a silver medal of honour given to the school by Prince Napoleon; the rest are turned over by the government. All the medallists were from the departments. Only two diplomas were granted to natives of Paris, one to a Bulgarian, another to a Greek, and a third to a Belgian.

Colonies.

EXHIBITION IN VICTORIA.—The holding of a series of exhibitions of industry and art appears to be contemplated in this colony. It is proposed that the inaugural exhibition shall take place in Melbourne early next year, and a resolution in favour of granting a sum in aid of the project has been passed by the Legislative Assembly.

TOBACCO IN SOUTH AUSTRALIA.—Some very fine specimens of tobacco, grown on a farm at Dandenong, have been forwarded to Melbourne for inspection. The application of guano has caused the leaves to attain quite an extraordinary size. The length of the longest leaf grown on the Experimental Farm is stated at 2ft. 2in. 12 specimens contain leaves measuring 2ft. 9in.

POST-OFFICE SAVINGS BANKS IN AUSTRALIA.—Among the measures before the colonial parliament is a bill to amend the post-office law. The object of it is to create post-office savings banks. Already there are 55 offices in connection with which savings banks may be forthwith established. Deposits of 6d. and upwards will be received and interest allowed at 4 per cent.

CONDITION OF SOUTH AUSTRALIA.—Messrs. S. W. Silver and Co.'s special correspondent in South Australia writes as follows:—"Adelaide, April 27th, 1865.—With one or two exceptions, all classes in South Australia are in a condition of high prosperity. The farmers have been blessed with two consecutive years of good crops coupled with high prices. The great mines of the Peninsula—the Wallaroo and Moonta—have continued to yield in undiminished quantity, and several other mines of smaller importance are adding their contribution to the exports. Trade in Adelaide is sound and active, and to carry on their various industries labour is in brisk demand."

All efficient emigrants are very rapidly drawn into employment, and it has been resolved by Parliament to double the number of emigrants introduced at the public expense. The revenue at present accruing to Government is greatly in excess of expenditure, and it is estimated will, during the present year, amount to £800,000, a sum equal to the national debt of the colony. This large revenue is partly due to the fact that farmers are in the land market, to invest the unusual profits of the past two years. Crown land rates during the present year have already amounted to £118,596, whereas the annual average for a similar period since 1859 has been only £42,858. The increase in the proceeds of Crown lands is also to be ascribed to a policy, the soundness of which is much questioned, that of putting up land for sale in such a manner that the pastoral tenants of the Crown are compelled to buy large tracts of country to save their runs from being cut to pieces. These purchasers are not anxious to buy, as they have to incur heavy liabilities in order to do so—the Treasury does not want their money—and large slices of the public estate are thus getting alienated into a few hands. This policy would be the less to be regretted, however, if Parliament should avail itself of this opportunity to do what many people are agitating and hoping for, to do away with the Custom-house, and make Adelaide an entirely free port, in which event an immense and rapid stride in our prosperity might be reasonably expected. At present the squatters (the pastoral tenants of the Crown) are in an exceptionally depressed condition, although they still are, perhaps, on the average, the wealthiest class in the community. Their leases over a large part of the colony are falling in, and the re-valuation at which their runs are being re-let to them, amounting in many instances to ten times what they have been accustomed to pay, is astonishing them greatly, although it is not probably generally beyond what is fair to the public demand. Over a large part of the colony they have been suffering from a very protracted drought, which has caused the death of sheep and cattle by thousands. As an incidental consequence it may be mentioned that the price of meat has risen greatly, but beef is retailed at 8d. per lb., being likely, according to good judges, to rise to 1s. The want of rain has also diminished the yield of our vineyards this year, and our wine growers are hardly in a position to stand a heavy check, as home consumption is so well supplied now that the price of wine has fallen. The squatters and the wine-growers are the two principal exceptions noted above to the special present prosperity of the producing classes in South Australia. The history of the colony for the past month has not been especially eventful. After a general election the fourth Parliament of South Australia has met, but, after a fortnight's session as adjourned till the 9th of May, having done little beyond voting supplies to the 30th of June, and agreeing to increased emigration, as already noted. A commission on national defences has sat and taken evidence, and has recommended the importation of improved artillery and fleets, and the re-organisation of the volunteer force. Our government is in communication with Downing-street on the subject of fresh postal arrangements with the mother country, and is prepared to add £5,000 to its annual subsidy to induce the ocean steamers to call at Kangaroo Island, or what would be preferred, some port on the South Australian mainland."

WINE IN SOUTH AUSTRALIA.—A large quantity of excellent wine is expected here this year. The produce, however, of 7,000 acres of grapes is far beyond the consumption of the colony. Vine growers are divided in opinion as to free distillation, but it is the general opinion at least without that concession the large capital invested in South Australian vineyards cannot be remunerative.

THE SYDNEY MINT BILL.—making permanent provision for the establishment of the Sydney Mint—has passed round the Colonial Parliament. The object of the measure is to enable the gold coin of the colony to be made a legal tender in the United Kingdom, which con-

cession has been promised by the Home Government upon permanent provision being made by the Sydney Mint. In the course of the debate on the second reading of the bill in the Assembly, doubts were expressed as to the advantage of the colonial sovereign having a currency in England, as, being of greater intrinsic value than the English sovereign, they were, on reaching London, melted and transmitted to the Bank of England in bullion.

SOUTH AUSTRALIAN REVENUE.—The public income of South Australia for the year ended March 31st last, was £830,161, the balance in hand bringing the total up to considerably more than £900,000. This is without borrowing the money authorised by the Loan Bill of 1864. The increase upon the year's revenue was £170,616, a very large sum, especially considering that the previous year itself showed an increase upon its predecessor amounting to £133,614. The increase of revenue for the year 1865, March 31st, over and above the year ending 31st March, 1864, was therefore £304,130.

CENSUS IN AUCKLAND.—From the last census, taken on 2nd December, 1864, it appears that, exclusive of the military, both imperial and colonial, and their families, the total population of the province on the above date was 37,008 souls, of whom 15,357 were females. The number of acres fenced was 128,705. There were under cultivation 87,147 acres, of which there were in wheat, 856; oats, 3,394; barley, 154; maize, 754; potatoes, 3,459; in garden or orchard, 1,855; unsown grasses, 75,680; and in other crops, 995 acres. Of live stock the province contained 7,233 horses, 111 mules and asses, 42,120 cattle, 73,145 sheep, 3,273 goats, 12,936 pigs, and 104,564 poultry. The number of military settlers and their families in the province of Auckland were—males, 4,035; females, 1089; total, 5,124; making the total population of the province when the census was taken, males, 25,686; females, 16,446; total, 42,132 souls.

THE MURRAY DUTIES.—This question has excited considerable discussion of late in South Auckland, the government of New South Wales having, it is said, most abruptly terminated the engagement with that colony, and entered into negotiations with the government of Victoria respecting the collection of duties on goods passing up the Murray into the other colonies. The inhabitants of South Australia have also spoken strongly on the discourtesy thus shown to South Australia; and the Adelaide Chamber of Commerce have also, through the government, remonstrated with the government of the adjoining eastern colonies.

Notes.

MONMOUTHSHIRE PRIZE SCHEME ASSOCIATION.—The annual distribution of prizes provided by the iron and coal masters of this county took place recently. The bishop of the diocese presided, whilst the prizes were distributed by Sir Thomas Phillips, Q.C., assisted by the Mayor of Newport. The report of the Examiners showed that education is in a flourishing condition in this county; its prize scheme for the encouragement of elementary schools is extremely well supported. There were 325 candidates competing; out of this number 104 failed entirely. Sixty-four £10 prizes were distributed in money, whilst 134 books were awarded to the most proficient scholars in religious knowledge, and 220 certificates were also distributed. All schools in the county, irrespective of their creed, were admitted to the competition.

FRENCH RURAL EDUCATION.—Frotey-lez-Vesoul, a small place near Vesoul, in the Haute Saone, has the honour of being the first rural commune in France to establish competitions in education and agriculture and the public distribution of prizes in its schools. The society which has taken this work in hand is called the Academy of Frotey, and aims at the establishment of a model commune, and further at aiding, by all the means

in its power, the efforts of the minister of public instruction towards creating prizes to be distributed annually in all the village schools in the empire, and in establishing annual competitions between the primary schools of each canton. One of these annual competitions is announced to take place on the twentieth of August, between the schools of Froley and the seven adjoining cantons, and a *fête* took place at the Pré Catelan, in the Bois de Boulogne, on the 30th July, in aid of the funds of this benevolent society. The Emperor, in order to encourage the efforts of the Academy of Froley, has placed a gold medal at its disposition, accompanied by a note, expressing his Majesty's approval and good wishes respecting the objects of the society.

INSECT DESTROYERS.—The subject of the protection of small birds in the interest of the farmer has of late attracted as much attention in France as in England, and the following is the estimate of a French writer upon the subject:—"In former times, before such incessant and unmerciful war was waged against thrushes, blackbirds, nightingales, larks, tomits, robins, finches, linnets, wrens, &c., it was calculated that there were ten thousand nests on the average to every square league of ground, and that there were on the whole about four eggs to each nest; further, that the parent bird ate about sixty caterpillars and gave a quarter of that number to each of its young per day, making a total of a hundred and twenty insects destroyed, or about thirty-six millions per month. Can anyone imagine the amount of mischief which would have been done by these millions of caterpillars to the leaves, flowers, and fruits of our trees; to all our kitchen-garden produce, and our ornamental shrubs and flowers?" The statistics of the case may be open to cavil, but there can be no doubt about the soundness of the inference in favour of these feathered friends of the farmer, the gardener, the florist, and the world at large.

TECHNICAL FEMALE EDUCATION.—An excellent society has been in operation for some time in Paris, which has for its object the giving sound elementary and professional instruction to girls, and at the same time the preserving them from the dangers and inconveniences of the workshop. The founders of this philanthropic establishment are ladies, the wives of M. Jules Simon and other gentlemen, whose efforts on behalf of the working classes are well known. The society has already two establishments in Paris, one in the Rue du Val Sainte Catherine, and the other in the Rue Rochechouart, and contemplates opening others in the metropolis as well as in the great manufacturing towns in the departments, as soon as its funds will permit. Each establishment unites the school and the workshop under the same roof. Pupils are admitted from the age of twelve years, without any distinction as regards creed, but a course of moral instruction forms part of the system. The morning is given to study, and the afternoon to work. The latter section is divided into five groups:—commerce, fabrication of garments, linen work, industrial design, and wood engraving. Each pupil has to pay ten francs a month, and prizes in money are distributed after the examinations. When the pupils have passed through the schools they are still protected by the society, which occupies itself with providing work for them, either in families or in respectable places of business. There are at the present time two hundred young girls in the establishments. The whole is supported by voluntary subscription; each founder pays a single sum equal to ten pounds; a titular member £1 a year; and subscribers what sums they think fit. This society has been formed without ostentation and without publicity, and is, beyond question, one of the most useful institutions which have sprung up in Paris by voluntary subscription.

COST OF CLEANING THE STREETS OF PARIS.—The sweeping of the macadamized roads costs £33,680 a year; the cleaning of the paved ways £91,000, of which £3,120 goes for materials, £20,400 for carting away the dirt, and the rest in paying the sweepers, who consist of women as

well as men. The expenses of management and superintendence are £10,400. Total expenditure, £135,080.

THE SARDINE FISHERY.—This industry is one of considerable importance on certain parts of the French and Italian coast. A letter addressed to the *Préfet de la Loire*, from Douarnenez in the department of Finistère, in the last week of July, announced the appearance of these little fish, and states that the average take had been from five to six thousand sardines per boat.

Patents.

Lime, superphosphate of, from guano—1790—A. V. Newton.
Machines or engines, steam pumping—1700—M. Benson.
Mandrels for rollers used in printing or embossing—1850—D. and J. Fulton.
Mattresses, &c., material for stuffing—1800—T. F. Henley.
Puddling, balling, heating, and melting metals, furnaces for—1850—D. Caddick.
Pumps—1864—R. A. Brooman.
Rails for railways and tramways, connecting—1878—C. Henderson.
Railway signals—1856—A. de Metz and T. W. Fry.
Railways, permanent ways of, and locomotives applicable thereto—1893—W. J. Hixon.
Rocks, &c., machinery for boring—1778—G. Low.
Sails, &c., winding—1872—J. B. Whitehall and T. Pillings.
Skeels for iron or steel tubes—1858—S. Hingley.
Sluices or dams, construction of—1870—T. W. Wood.
Sowing seeds and depositing manure, drills for—1867—J. Armitage.
Steam, apparatus for increasing the mechanical power of—1852—F. A. Lytle.
Trains by atmospheric pressure, locomotion of—1852—W. P. Blythe.
Vermis traps—1886—J. Miles.
Weaving, looms for—1876—M. Knowles.

INVENTION WITH COMPLETE SPECIFICATION FILED.

Hats—1871—T. D. Stetson.

Announcements by the Council.

PROGRAMME OF EXAMINATIONS FOR 1865.

PRELIMINARY NOTICE.

I. The Examinations described herein have been established for the benefit of the members and students of Institutions in Union with the Society of Arts. Such persons are commonly mechanics, artisans, soldiers,* labourers, clerks, tradesmen and farmers in a small way of business, apprentices, sons and daughters of tradesmen and farmers, assistants in shops, and others, of various occupations, who are not graduates, undergraduates, nor students of a University, nor following nor intending to follow a learned profession, nor enjoying nor having enjoyed a liberal education. To all such members and students, and persons of the like condition, male and female, not being nor having been professional teachers or pupil teachers, the examinations, certificates, and prizes, described in this programme, are open on the general conditions stated herein. Persons who are, or have been, professional teachers, or pupil teachers, may obtain certificates, but cannot compete for prizes.†

II. The certificates are not competed for. They are awarded as records of positive not comparative attainment. The prizes are competed for.

III. For the conditions on which persons of a higher grade in society may be examined and receive certificates, at not compete for prizes, see par. 10 (D).

IV. The candidates for Examination have not to go to distance from their homes. The examinations are held in all places in the United Kingdom where a Local

Educational Board connected with the Society of Arts is willing to make the requisite arrangements.

V. For a list of the Local Boards already formed, see page 624.

VI. For instructions as to the formation of Local Boards and their duties, see page 617.

The EXAMINATIONS are twofold—

- (1.) The Previous Examinations by District Unions and Local Boards for persons of any age not under 12.
- (2.) The Final Examination by the Society of Arts Board of Examiners, under the supervision of the Local Boards, for persons of any age not under 16.

PREVIOUS EXAMINATIONS BY DISTRICT UNIONS AND LOCAL BOARDS.

1. These are intended to serve two purposes:—

(1st.) To "sift" the Candidates for the Final Examination, so as to keep back those who, not being yet fairly grounded in the elements of education—spelling, writing, and arithmetic—nor fairly acquainted with the subject or subjects in which they desire to be examined by the Society of Arts, are unlikely to succeed in that Examination. The sifting in elementary subjects may be effected in any mode at the discretion of the Local Boards; but they are recommended (for the sake of convenience and uniformity) to adopt the "Scheme of Elementary Examinations" given below. The best mode of sifting the Candidates in the subjects in which they desire to be examined by the Society of Arts is for the Local Boards to examine them therein by means of printed (or written) questions and written answers; but, where a Local Board finds itself without the means of conveniently holding such an Examination in any special subject, such Board may satisfy itself in any other mode, and state simply that it has satisfied itself, that the Candidate is fit to be examined by the Central Board in that subject.

2. (2nd.) To encourage and lead on those who, from the insufficiency of their age or of their elementary knowledge, are not yet qualified for admission to the Final

* The following circular memorandum (Gen. No. 331), addressed to the army at home, has been issued:—"Miscellaneous (1865).—The Field Marshal Commanding-in-Chief desires it to be notified that there will be no objection to soldiers, their wives, and families, being permitted to present themselves for instruction and examination at the Educational Institutes in connection with the Society of Arts, on the understanding that they are not on that account to be exempted from any military duty, nor, except in special cases, to be out of barracks after dusk-setting or tattoo.—By command of his Royal Highness the Field Marshal Commanding-in-Chief, JAMES YORKE SCABT, Adj. Gen.—Horse Guards, S.W., 11th March, 1865."

† Except in some special cases where prizes are expressly offered by local bodies to pupil teachers.

Examination of the Society of Arts, but desire to obtain minor certificates from the District Unions and Local Boards.

3. The beneficial effect of such Examinations in elementary knowledge is greatly enhanced where prizes are offered by the District Unions and Local Boards to be competed for by the Candidates.

SCHEME OF ELEMENTARY EXAMINATIONS FOR 1866.

4. This scheme has been agreed on by the representatives of the District Unions in connexion with the Society of Arts, and presents therefore the advantages of a common standard of uniform Examination Papers, and of common forms of Certificate to be granted by the various District Unions and Local Boards.

5. It is in two grades, and the Candidates should be allowed to select either grade at their discretion.

LOWER GRADE.

1. Every candidate must be examined in the first four rules of Arithmetic, simple and compound.

2. Female candidates must also be examined in plain needle-work.

3. Male candidates must also be examined in one at least of the three following subjects:—

A. A General knowledge of the Gospel History.

B. The rudiments of English History.

C. The rudiments of the Geography of England.

4. Fairly good writing and spelling, with good reading of a simple narrative, will also be required.

5. A satisfactory examination will entitle the candidate to a certificate from the District Union or Local Board.

HIGHER GRADE.

1. Every candidate must be examined in Arithmetic, including the Rule of Three, Decimal and Vulgar Fractions.

2. Every female candidate must also show proficiency in needle-work.

3. Male candidates must also be examined in one at least of the three following subjects:—

A. The facts of St. Matthew's Gospel and the Acts of the Apostles.

B. A General knowledge of English History, and especially of the reign of George III.

C. The Geography of Great Britain and Ireland.

4. A fairly good handwriting, spelling, and knowledge of grammar will also be required.

5. A satisfactory examination will entitle the candidate to a certificate from the District Union or Local Board.

6. These Examinations must, in 1866, be held on the 13th and 14th March, after three o'clock, p.m.

7. The Secretary of each District Union and Local Board desiring to use the Elementary Examination papers,* and the Forms of Certificate, provided for common use, must apply for them to the Secretary of the Society of Arts, before the 13th of February, stating the number of male and female candidates respectively in each grade. The

* The uniform Examination Papers afford a common standard of examination; and, to promote uniformity in the application of that standard, special copies of the examination papers, with the number of marks to be awarded for a complete answer to each question, will be printed for the use of the examiners alone. Thus, suppose that in a paper there are twelve questions, and that the aggregate number of marks assigned to the paper is 120; the number of marks placed opposite to each of the questions will depend upon their relative difficulty, and the proportion of these marks given by the examiner for the answer of any candidate will depend upon its accuracy and completeness. Supposing a perfect answer to a question to be set down as worth 20 marks, an examiner may award 20, 15, 12, or any less number, according to the merit of the answer. Thus the candidates all over the country, though their papers be tested by different examiners, will be placed as nearly as possible upon an equal footing. No candidate should receive a certificate who does not obtain at least 30 marks in each paper, the whole paper being worth 120 marks. In the subjects of reading, writing, spelling, and needlework, it is not thought desirable to fix any number of marks as a standard of proficiency. It is important that the same person should examine all the candidates in any one subject at any centre.

Examination papers will be forwarded to the Secretary of the Board, but must of course be kept secret from the candidates until the time of the Examination.*

8. When the Previous Examinations are completed, a return, in the following form, must be made to the Secretary of the Society of Arts, who will then forward the proper number of blank Forms of Certificate to be awarded by the Local Board:—

ELEMENTARY EXAMINATIONS, 1866.

FINAL EXAMINATION BY THE SOCIETY OF ARTS.

9. No Candidate can be admitted to the Final Examination without a Certificate or Pass from a District Union or Local Board, before which he or she has passed Previous Examination.

10. Every admitted Candidate must be at least 15 years of age.

(A.) Members of, or students of classes in, Institutions in Union with the Society of Arts, are examined Free.

(B.) Members of, or students of classes in, Small Institutions,† not in Union with the Society of Arts, but subscribing one guinea a year for admission to the Examinations alone, are examined Free.

(C.) Members of, or students of classes in, "Small Institutions" not in Union with the Society of Arts, but connected with it through a District Union or Local Board, are examined on payment of a fee of 2s. 6d.

(D.) Persons of a higher class of society than those described in paragraph 1. (Preliminary Notice), are examined on payment of a fee of 10s. 6d.

N.B. The Council in every case leave it to the Local Board to decide whether a candidate should pay the higher fee.

11. Candidates coming under the head (D.), as well as Professional Teachers and Pupil Teachers, though they may receive certificates, cannot compete for prizes.

12. A copy of Form No. 2 will be forwarded to the 1st March, to the Secretary of each Local Board, and must be filled up and returned to the Secretary of the Society of Arts before the 20th March. The requisite number of forms No. 4 will then be forwarded, and these, when filled up, must be returned not later than the 2nd of April. Each of these forms when returned, will be numbered at the office of the

* In any case in which a Local Examining Body may examine candidates in the doctrines of Holy Scripture, in the Prayer Book, or in any other religious formulary, the results of such Examination may be stated, by that Local Examining Body, on the certificate; though the form of certificate provided for common use does not include religious doctrine. The "Metropolitan Association for Promoting the Education of Adults" announces that at its request the Bishops of London and Winchester have established collateral examinations in the Bible and Prayer Book, with certificates and prizes for those certificates of that Association who may desire to enter examinations in such subjects.

† Small Institutions are defined as those which have an income of less than £75 a year.

Society of Arts, and a card for each candidate, with his name and his number, will afterwards be forwarded to the Secretary of the Local Board for distribution, together with copies of the time-table.

13. The printed papers of questions in the various subjects will be afterwards forwarded to the Secretary of the Local Board; the whole of the papers appointed for each of the evenings of the Examination being contained in a separate sealed envelope, which is not to be opened till the Candidates are present, at half-past six on that evening.

14. Precise details as to the mode in which the Final Examination is to be conducted are contained in the Letter of Instructions, and members of the Local Boards should make themselves thoroughly acquainted with them.

15. When the Candidates' papers have been submitted to the judgment of the Society's Examiners, certificates of three grades will be awarded, and the names of the candidates who obtain prizes and certificates will be afterwards published in the *Journal of the Society of Arts*.

16. A Candidate who has obtained from the Society a certificate of the 1st class in any subject cannot again be examined in the same subject; but a Candidate who has obtained a certificate of the 2nd or 3rd class may, on the recommendation of the Local Board, be examined in the same subject, in a subsequent year, without again passing the Previous Examination.

17. A Candidate who, having obtained a certificate in any subject, desires to be examined in some other subject, in a subsequent year, may be "passed" by the Local Board, after examination in that subject, without re-examination in the elementary subjects; but, in all cases, the name must be returned in the proper form (No. 4).

18. Particulars of the subjects for the Final Examination are given.

19. The Time-table has been drawn up to meet the general convenience of the Candidates; and no variation of it can possibly be allowed, so that, in choosing the subjects in which they desire to be examined, Candidates must take notice of the arrangements of this Time-table, they cannot be examined in two subjects which are set down for the same evening. The hours of Examination must be strictly adhered to.

20. The Examiners will reject all ill-written, ill-spelt, uncomposed, or ungrammatical papers that may be laid before them.

TIME-TABLE FOR 1866.

TUESDAY, 24th April, from 6.30 to 9.30 p.m.	WEDNESDAY, 25th April, From 6.30 to 9.30 p.m.	THURSDAY, 26th April, From 6.30 to 9.30 p.m.	FRIDAY, 27th April, From 6.30 to 9.30 p.m.
Arithmetic. Trigonometry. Metricity and Magnetism. Light and Heat. Painting and Me- chanics. Ornamental Drawing. Gardening. Agriculture.	Book-keeping. Navigation, &c. Conic Sections. Chemistry. Music. Domestic Eco- nomy. English History. Italian.	Algebra. Practical Me- chanics. Animal Physio- logy. Political and So- cial Economy. French. English Litera- ture. Fruit and Vege- table Culture. Freehand Draw- ing.	Geometry. Mensuration. Principles of Mechanics. Botany. Geography. Latin. Logic and Men- tal Science. Spanish.

Two Papers of one hour and a half each in this subject are con- sidered as one.

LOCAL EDUCATIONAL BOARDS.

21. Local Boards may be formed wherever the managers of Institutions, or other persons, may be prepared to co-operate with the Society of Arts.

22. Each Local Board must consist of at least three members, and must have a Chairman and a Secretary. The manner in which the Board is to act should be defined; and every Educational Institution within those limits

should be represented in the Board. The composition of the Board must be such as to command the respect and confidence of the neighbourhood. No member or officer of a Local Board can be admitted to the examinations.

23. The duties of the Local Boards may be defined as follows:—

(A) To give publicity to the system of Examinations by the circulation of the programmes, hand-bills, &c. (copies of which will be furnished *gratis* on application), and to give encouragement and advice to those young persons who are likely to become candidates.

(B) To hold the Elementary or Previous Examinations.

(C) To superintend the Final Examinations.

24. Local Boards make no payment to the Society, unless they exercise the power of admitting candidates who are not members of any Institution in union with the Society of Arts (see par. 10 C); in which case a subscription of one guinea a year must be paid.

25. A detailed list of each Local Board (giving the exact address of the Secretary) must be submitted to the Council of the Society of Arts before the 1st of February, 1866, when the general list of such Boards will be published; and where a Local Board comprises so large a district that, for the convenience of the candidates, Branch Local Boards have to be formed, lists of these must also be given. All changes in the composition of the Boards must be notified to the Society of Arts.

SUBJECTS FOR THE FINAL EXAMINATION IN 1866.

* * * Owing to the small number of candidates desiring (for several years past) to be examined in Astronomy and Agriculture, the Council, on the recommendation of the Education Committee, have removed these two subjects from the list; but should they be informed, in any subsequent year, that these subjects are being studied by any considerable number of candidates, they will feel pleasure in restoring them to the Programme. No paper will be set in Conic Sections unless information is received before the 1st of January, 1866, that several candidates are intending to be examined in that subject.

26. In the following paragraphs will be found brief outlines of the subjects in which candidates may be examined, and their attention is especially drawn to this part of the Programme. In many instances the Examiner has set down certain Text-books; but, in most cases, a candidate may exercise his own judgment as to what Text-Book he uses; real knowledge, however or wherever acquired, will be accepted by the Examiners. In the following subjects, however, Political Economy, English History, English Literature, Logic, Latin and Roman History, French, German, Italian, and Spanish, the course of study is necessarily prescribed with more or less exactness.

I.—ARITHMETIC.

Examiner.—Rev. Alexander Wilson, M.A., National Society, London.

27. Practice—Simple and Compound Proportion—Interest—Discount—Insurance—Vulgar and Decimal Fractions; with the principles of a Decimal Notation in money on the basis of the pound unit.

28. The questions framed from the preceding syllabus will consist mainly of practical problems, and the Examiner will take into account not only the correctness of the answers, but also the excellence of the methods by which they are worked out, and the clearness and neatness of working, which must always be shown.

29. Text Books:—Any of the modern treatises on Arithmetic, such as Hunter's Text Book (*National Society*), Colenso (*Longmans*), or Barnard Smith (*Macmillan*).

II.—BOOK-KEEPING BY DOUBLE ENTRY.

Examiner.—John Ball, Esq., of the firm of Messrs. Quilter and Ball, and Robert G. O. Hamilton, Esq., Principal Accountant to the Committee of Council on Education.

30. Candidates should be prepared to answer questions as to the nature and use of the different books usually kept in a merchant's office; to journalize a series of transactions from a waste book, and having posted the entries to the ledger, to balance the accounts, to prove the correctness of the postings by a trial balance, and finally to exhibit an account of profit and loss, and a balance sheet.

31. Text Books:—*Rudimentary Book-keeping (Weale's Series)*. Kelly's *Elements of Book-keeping (Simpkins and Co.)*. Examination-Questions in Book-keeping by Double Entry, by the Rev. J. Hunter, M.A. (*Longmans*).

III.—ALGEBRA.

Examiner.—J. J. Sylvester, Esq., M.A., F.R.S., Professor of Mathematics at the Royal Military Academy, Woolwich.

32. Elementary Operations and Fractions, Simple and Quadratic Equations and Problems leading to them. Involution and Evolution. Surds. Arithmetical, Geometrical, and Harmonic Series. Combinations and Permutations. Binomial Theorem. Scales of Notation. Interest and Annuities. Elementary Theory of Probabilities.

33. Text Books:—*Todhunter's Algebra (Macmillan)*, *Colenso's Algebra (Longmans)*, *Lund's*, or any other modern treatise on Algebra.

IV.—GEOMETRY.

Examiner.—Rev. B. Morgan Cowie, M.A., Professor of Geometry at Gresham College; one of H.M. Inspectors of Schools.

34. To obtain a first-class certificate, at least six problems and four propositions must be correctly done; to obtain a second-class, at least four problems and eight propositions.

35. Text Books:—*Euclid, Books I., II., III., IV., VI., XI.,* as far as Prop. 21. *Potts' smaller edition (Parker)*. *Green's Euclid's Plane Geometry*, practically applied, is a useful help to those who are studying by themselves (*Heywood, Manchester; Simpkin, Marshall and Co., London*).

V.—MENSURATION.

Examiner.—John Sykes, Esq., M.A., Assistant-Secretary to the Committee of Council on Education.

36. The calculation of the areas and circumferences of plane figures bounded by arcs of circles or right lines, and solid contents of cones, cylinders, spheres, &c. Candidates will be expected to be familiar with the different rules for measuring and estimating artificers' work, such as joiners', bricklayers', masons', and plumbers' work, and to be able to prepare estimates of such work from given quantities.

37. Text Books:—*Lund's Mensuration, Part III., of his Elements of Geometry and Mensuration*. *Tate's Mensuration*. *Young's Treatise on Mensuration (Simms and McIntyre)*.

38. The Examiner, in referring to last year's papers, complains of the "want of due attention to the elements of the subject," and says of the candidates that "in the geometrical part their work is satisfactory, but in the arithmetical part it is not."

VI.—TRIGONOMETRY.

Examiner.—Rev. T. G. Hall, Professor of Mathematics in King's College, London.

39. In Plane Trigonometry, the formulas for the trigonometrical functions of angles, the numerical solution of plane triangles, the use of logarithmic tables, and angular and exponential series.

40. Spherical Trigonometry, Napier's Rules, and the Solution of Spherical Triangles.

41. Text Books:—*Snowball's or Todhunter's Trigonometry*, *Hall's Trigonometry for Schools for Space Trigonometry (Christian Knowledge Society)*, or any one of the modern treatises on Trigonometry. *Mathematical Tables (Chambers' Series)*.

VII.—CONIC SECTIONS.

Examiner.—Rev. Bartholomew Price, M.A., F.R.S., Senior Professor of Natural Philosophy in the University of Oxford.

42. The properties of the three curves treated geometrically; also as deduced from the cone. The principles of projection, orthogonal and central, applied to derive properties of the conic sections from those of the cone.

43. Analytical Conics, including the equations of a straight line, the circle, the three conic sections, and the general equation of the second degree.

44. Text Books: *Drew's Conic Sections (Macmillan)*, *Taylor's Conic Sections (Macmillan)*, *Salmon's Conic Sections (Longmans)*, *Todhunter's Conic Sections (Macmillan)*.

45. * * Notwithstanding the small number of examinations that have appeared in this subject for several years, the Council are unwilling to remove it from the list, on account of its practical value, especially to workmen employed in cutting wood and stone, and in the arts of construction generally, but no paper will be prepared next year, unless information should be received, before the 1st January, 1866, that several candidates are desirous of being examined in it.

VIII.—NAVIGATION AND NAUTICAL ASTRONOMY.

Examiner.—Rev. Joseph Woolley, LL.D., one of Her Majesty's Inspectors of Schools.

46. A good knowledge of Plane and Spherical Trigonometry, of the definitions and terms used in Nautical Astronomy, and of the various measurements of time, and their mutual conversions will be required, as well as skill in the use of logarithmic tables, and neatness, order, and accuracy in the numerical solutions of problems.

47. The candidate should understand the construction of nautical charts; the nature and laws of circular storms; great circle sailing, &c.; the methods of determining the latitude, longitude, variation of the compass, and error and rate of a chronometer by astronomical observations, with the demonstrations of the formulas employed; the use of nautical astronomical instruments, &c.

48. Text Books:—*The Nautical Almanac (Harrison)*, *Riddle's Navigation and Nautical Astronomy (London, Essex-street)*.

49. N.B. Candidates in this subject should be able to use the *Nautical Almanac and Tables during Examination*.

IX.—PRINCIPLES OF MECHANICS.

Examiner.—Rev. Jonathan Bates, M.A., Fellow of Gonville and Caius College, Cambridge.

50. The properties of matter, solid, fluid, and gaseous.
51. Statics: The composition, resolution, and equilibrium of pressures acting on a material particle, and on constrained particles; machines; attractions.

52. Dynamics: the laws of motion; impact; projectiles; constrained motion; central forces; oscillations.

53. Rigid Dynamics: Motion of a rigid body about a point;—of a free rigid body;—of a system of rigid bodies.

54. Hydrostatics: Pressures of fluids; equilibrium of floating bodies; specific gravity; elastic fluids; machine of temperature and heat; steam; evaporation.

55. Hydrodynamics: Motion and resistance of fluids in tubes, &c.; waves and tides.

56. Pneumatics: Mechanical properties of air; barometer, and other machines illustrating the mechanical properties of air.

57. Text Books:—*Todhunter's Statics, or Principles of Mechanics*. *Goodwin's Mathematics*. *Miller's, Plana's, or Besant's Hydrostatics*. *Webster's Theory of Fluids*.

The treatise on this subject in Orr's Circle of the Sciences. Golding Bird's Elements of Natural Philosophy, by C. Brooke (*Churchill*). Lardner's Handbooks on Natural Philosophy.

58. The Examiner, in referring to last year's candidates, regrets "a want of clearness and perspicuity, which poils the effect of the results," and adds "a word of caution to the candidates as to more earnest effort to secure method, well-digested arrangement, and neatness in their papers."

X.—PRACTICAL MECHANICS.

Examiner.—T. M. Goodeve, Esq., Professor of Mechanics at the Royal Military Academy, Woolwich.

59. The applications of the Principles of Mechanism to simple Machines. The Steam Engine.

60. Text Books:—Bourne's Catechism of the Steam Engine (*Longmans*). Scott Russell on the Steam Engine. Jasmyn's Elements of Mechanism, with remarks on Tool- and Machinery (*Weale*). Goodeve's Elements of Mechanism (*Longmans*).

XI.—ELECTRICITY AND MAGNETISM.

Examiner.—Charles Brooke, Esq., M.A., F.R.S., Surgeon to the Westminster Hospital.

61. Construction and Properties of Magnets; Magnetic Instruments; Terrestrial Magnetism; Diamagnetism.

62. Statical or Franklinic Electricity; Voltaic Electricity; Electro-dynamics; Electro-telegraphy; Electro-metallurgy; Thermo-Electricity; Organic Electricity.

63. Text Books:—Golding Bird's Elements of Natural Philosophy, by C. Brooke (*Churchill*). Lardner's Handbooks of Natural Philosophy (*Walton and Maberly*). Jeanning Jenkin's report on the Electrical Instruments in the XIII. of the Exhibition of 1862, for Electro-telegraphy. Herschel's Discourse on the Study of Natural Philosophy (*Longmans*) for a general view of the subjects.

64. The Examiner, in his last year's report, observes, at "the mariner's compass, its construction, its deviations, and the most practicable methods of correcting the errors therein arising, does not yet appear to command the attention of advanced students to the extent the subject is entitled to, considering the present vast and increasing importance of iron in marine architecture."

XII.—LIGHT AND HEAT.

Examiner.—Richard Potter, Esq., A.M., late Professor of Natural Philosophy and Astronomy in University College, London.

65. What is the sense of sight?—ancient theories—modern definitions and hypotheses of the nature of light the especial privileges of animals which possess organs of vision—the simple laws or properties of light required to be known before we can discuss the structure of the eye, and the construction of telescopes, microscopes, and other optical instruments—optical images real and virtual and how they occur in optical instruments.

66. Why do we distinguish between Physical and Optical optics?—what are double refraction of light polarization of light—interference of light—examples of these properties, how shown—phenomena of recurring colours—examples—how are explained the colours of the peacock's tail—the colours seen on looking towards a light through the feathers of small birds—the colours of mother-of-pearl—the rainbow, &c., &c.—the laws of the interference of polarized light—to describe cases of these vivid phenomena.

67. What are the definitions of heat, radiant, latent, sensible?—what is meant by caloric?—hypotheses of the nature of heat—capacity of bodies for heat—the temperature of bodies—how measured by instruments—descriptions of thermometers and pyrometers—the scales of thermometers—how compared—how the volumes of solids, liquids, and gases, depend on their temperature—absolute zero of cold—elastic force of vapours and gases produced by heat employed in steam and air engines—

winds from the unequal heat of the atmosphere. What are the connexions and analogies of heat and light?

68. Text Books:—The Library of Useful Knowledge. Brewster's Optics (Cabinet Cyclopaedia). Potter's Physical Optics, the descriptive and experimental treatise (or first part) (*Walton and Maberly*).

XIII.—CHEMISTRY.

Examiner.—A. W. Williamson, Esq., F.R.S., Professor of Chemistry, University College, London.

69. Preparation and properties of the chief gases, acids, bases, and salts. Laws of combining proportion by weight and by volume. Analytical processes for the detection and separation of metals, acids, &c. Preparation and distinctive properties of the chief kinds of alcohol, of organic bases, fixed and volatile organic acids, sugars, woody-fibre, starch, &c.

70. Candidates are expected to be able to explain chemical reactions by the use of symbols. Questions illustrative of general principles will be selected from the following, amongst other manufactures: Metallurgy of Lead, Iron, and Copper; Bleaching, Dyeing, Soap-boiling, Tanning; the manufacture of Coal-Gas, Sulphuric Acid, Soda-Ash, &c.

71. Text Books:—Miller's Elements of Chemistry. Williamson's Elements of Chemistry (will appear in October, 1865).

XIV.—MINING AND METALLURGY.

Examiner.—J. Arthur Phillips, Esq., Civil Engineer, Graduate of the Imperial School of Mines of France, &c.

72. Candidates should be able to identify with facility the ores of the more common metals, and be acquainted with their chemical composition. They should also be familiar with the forms of occurrence of the various metallic ores, and the usual methods employed for their extraction and subsequent purification by crushing, stamping, washing, &c. Underground surveying, the principles of ventilation, particularly as applicable to collieries; a knowledge of furnace assaying, and a general acquaintance with the metallurgy of the more important metals are also required.

73. First-class certificates can be given to those only who have either acquired some practical knowledge of mining, or who possess a special acquaintance with the metallurgy of at least one of the useful metals.

74. Text Books:—Dana's Mineralogy (*Zubner and Co.*, Paternoster-row). Mitchell's Assaying (*Baillière*). Manual of Metallurgy (*Griffin*). Useful metals and their Alloys (*Houlston and Wright*). Ure's Dictionary of Arts, Manufactures, and Mines (*Longmans*). Percy's Metallurgy (*Longmans*). Metallurgy of Iron, Truran (*Spon*).

XV.—BOTANY.

Examiner.—Daniel Oliver, Esq., F.R.S., F.L.S., Keeper of the Herbarium at the Royal Gardens, Kew, and Professor of Botany in University College, London.

75. Sect. I.—The Structure of Plants and Vegetable Physiology. The Functions of the Various Organs, and their Morphological Relations. The Nature of the Principal Tissues. The Meaning of Botanical Terms. The application of Structural and Physiological Facts to Practical Purposes.

76. Sect. II.—Systematic Botany. The general principles upon which the Classification of Plants is based. The distinctive characters of the principal British Natural Orders of Plants. Naming Common Wild Flowers at Sight. The sources of the most important Economic Vegetable Products:—Timbers, Fibres, Fruits, Drugs, &c.

77. Section III.—Descriptive Botany. The Art of Describing Plants Correctly in Scientific Language.*

78. Text Books:—Lindley's School Botany (*Bradbury and Evans*); Oliver's Lessons in Elementary Botany (*Mac-*

* Living plants are provided by the Society for this examination.

millan); Lindley's Theory and Practice of Horticulture (*Longmans*); Oliver's Guide to the Kew Museums (pamphlet) (*L. Reeve and Co.*).

79. Candidates will be expected to return three correct answers to questions in Section I., three in Section II., and at least two of the plants must be described and referred to their respective natural orders in Section III.

80. Students are very strongly recommended to the frequent practice of describing plants; at first on forms or "schedules," as given in Professor Oliver's "Lessons," page 59, and, when sufficiently advanced, in detail, as in the examples given at page 293 of the same work, and in Dr. Lindley's "School Botany."

81. The Examiner observes:—"All candidates would do well to handle living plants frequently, dissecting and describing them as they go on, in accordance with the examples given in the works recommended to them as text-books."

XVI.—FLORICULTURE.

Examiner.—Thomas Moore, Esq., F.L.S., Botanic Gardens, Chelsea.

82. The candidates will be expected to answer questions on any of the undermentioned subjects:—

83. The leading Flowers of the different seasons, indicating those to be obtained naturally, and those by artificial means. Leaf Buds and Flower Buds, the conditions favourable to their development respectively. Food of Plants, how and whence derived, and in what form received. Manuring, substances best adapted for Flower Culture.

84. Improvement of Races in Plants, how has it been effected, and by what means can it be carried forward? Hybridization, objects and guiding principles of. Conditions necessary to ensure fertility in Flowers.

85. Construction of Houses for Plant Culture. Warming and Ventilation. Influence of Ventilation on Plants confined in forcing houses. Limits of Temperature endurable by Plants, and how to turn this to advantage in Practical Floriculture. Bottom heat, value of in Plant Culture. Watering, the rationale of—what to avoid. Liquid Manures.

86. Propagation, the various modes of, and their special adaptations. Germination of seeds, conditions favourable and unfavourable to. Vitality of seeds, duration of, and how best preserved. Treatment of Seedling Plants. Budding, Grafting, and Inarching, how performed, and to what subjects best adapted. Increase by cuttings and by layers. Leaf-cuttings, how is it that they can organize buds? Potting. Composts.

87. Acclimatisation. Is it possible to increase the hardiness of any race of plants, and by what means?

88. Text Books:—Lindley's Theory and Practice of Horticulture (*Longmans*), McIntosh's Book of the Garden (*Blackwood and Sons*), Thompson's Gardener's Assistant (*Blackie and Son*).

XVII.—FRUIT AND VEGETABLE CULTURE.

Examiner.—Robert Hogg, Esq., LL.D.

89. Sect. I.—*Fruit-Tree Culture*.—Kinds of Fruits adapted for various soils and exposures. The Propagation, Pruning, and Training of Fruit Trees. The Forcing of Fruit Trees, and their cultivation under glass, both in and out of pots. The Theory of Ripening, and the principles that ought to regulate the preservation of fruits after they are ripe or their subsequent maturation. The Packing of Fruit for transmission to great distances.

90. Sect. II.—*Vegetable Culture*.—The kinds and quantities of vegetable seeds and roots required for cropping gardens of given dimensions. The culture of the different kinds of vegetables and salads. The preparation of fermenting materials for artificial heating. The forcing of vegetables and salads.

91. Sect. III.—*General Subjects*.—Soils, Water, Atmospheric Air, Light and Heat in their relation to the successful cultivation of Fruit and Vegetables. Manures

and their application. The Diseases and Insects to which Fruit Trees and Vegetables are subject and their remedies. The Structure and Functions of the Organs of Plants, considered in their relation to growth and reproduction. The erection, heating, and ventilation of garden structures.

92. Text Books:—Loudon's Suburban Horticulture. Johnson's Cottage Gardener's Dictionary (*Bohn*), *Bohn's Fruit Manual* (171, *Fleet-street*).

XVIII.—ANIMAL PHYSIOLOGY IN RELATION TO HEALTH.

Examiner.—John Marshall, Esq., F.R.S., F.R.C.S., Surgeon to the University College Hospital, and Lecturer on Anatomy at the Government Department of Science and Art.

93. The general principles of Animal Physiology, and the application of them to the preservation of health to the wants and emergencies of daily life.

94. Text Books:—Carpenter's Animal Physiology, 1859 (*Bohn*). Mapother's Physiology and the Principles of Disease (*Longmans*). Mapother's Lectures on Public Health (*Longmans*). Lardner's Animal Physics (*Wells and Maberly*). Translation of Milne Edwards' *Manual of Zoology* (*Renshaw*). Marshall's Descriptions of the Human Body, with Atlas (*Day and Son*), for details of Anatomy.

95. The Examiner, in a very elaborate report on the last examination, describes a large proportion of the rejected candidates as "immature students, even of their own language, prematurely offering themselves for examination in so special a subject as Physiology." He gives lists of their numerous errors in spelling and in the use of scientific terms, and speaks of the "inaccuracy, the confusion of thought and expression, and the bad grammar, punctuation, and orthography, illustrated by the examples of errors" given by him.

XIX.—DOMESTIC ECONOMY.

Examiner.—The Very Rev. Richard Dawes, Dean of Hereford.

Questions for Male and Female Candidates.

96. Domestic Economy being mainly based on the applications of Chemistry and Physiology, both male and female candidates will be required to show acquaintance with the rudiments of these sciences. It should embrace the phenomena of nutrition, respiration, the functions of the skin, &c.; the rationale of light, warming, ventilating, cleaning, disinfecting, &c.; cooking, preserving, &c.; and the origin and manufacture of household articles, as far as this may be necessary to a correct appreciation of their relative value for use, and for the detection of defective quality, adulteration, or fraud.

97. The essentials of a healthy and comfortable dwelling—clothing in relation to sanitary principles—animal and vegetable. Dietaries. Effects of stimulants and narcotics. Fuel and other household stores. Weights and measures. Keeping of household accounts.

Questions for Male Candidates only.

98. Materials and appliances involved in the construction of dwellings. Co-operative Building and Investment Societies. Mutual Provident Societies for various purposes. Savings Banks. Present and deferred annuities.

Questions for Female Candidates only.

99. The management of infants. The care of the sick, &c.

100. Text Books:—For Introductory Scientific Knowledge:—Laws of Matter and Motion (Chambers' Educational Course) (*Chambers*). Mechanics of Fluids: Things, by Thomas Tate (*Longmans*). Experimental Chemistry, by Thomas Tate (*Longmans*). Physiology for Schools, by Mrs. C. Bray (*Longmans*). For Domestic Economy in general:—A Manual of Domestic Economy, by Tegetmeier (*Home and Colonial School Society*). Household Economy, by Margaret Brewster (*Constable and Co.*). Domestic Economy (Gleig's School Series) (*Longmans*).

XX.—POLITICAL AND SOCIAL ECONOMY.

Examiner.—Charles Neate, Esq., M.A., M.P., late Professor of Political Economy in the University of Oxford.

101. The examination will be devoted to the study of Civil Government and Social Economy, as set forth in the 3rd and 4th books of Stephens' Commentaries on the Laws of England. N.B.—In order to meet the question of expense as regards this work, candidates are informed that the earlier editions, which are obtainable at a reduced price, may be used, so long as they are not earlier than the 3rd edition.

102. Professor Fawcett's Manual of Political Economy must be studied by those who desire to obtain first-class certificates.

XXI.—GEOGRAPHY.

Examiner.—Wm. Hughes, Esq., F.R.G.S., Professor of Geography in King's College, London.

103. Candidates must show a sound knowledge of Elementary Geography, physical and descriptive. Such knowledge must embrace an acquaintance with at least the outlines of the great natural features of the globe, the political divisions of countries, and the localities of towns and other places of importance. This knowledge will be looked for in fuller extent with regard to the British Islands, and the various portions of the British Empire, than with regard to other countries. The growing importance of the colonial and foreign dependencies of Britain renders a knowledge of their geography now more than ever necessary. The Australian colonies, New Zealand, and British India, are hence proposed as subjects for more especial study on the part of the intending candidates for the ensuing year's examinations, and their attention is directed to them accordingly. In evidence of the knowledge possessed regarding those regions, the candidate will be required to sketch, from memory, a map of any one of the Australian colonies that may be named by the examiner. Such sketches need not possess accuracy of detail, but should at least show the general direction of coast-lines, mountain-chains, or river-courses, with the localities and names of the principal towns.

104. Candidates who aim at the highest class of certificate should be also prepared to answer such questions upon Geography in its relation to the Physical Sciences and the History of Mankind, as involve a general acquaintance with the subject of Climate, the laws of Meteorology, the Distribution of Plants and Animals over the Globe, the leading outlines of Geology, the Ethnographic Division of the Human race, and the commercial resources of different lands. This kind of knowledge is looked for, not in place of geographical knowledge of a more elementary kind, but as supplementary to it, and throughout based upon it.

105. Text Books:—Manual of Geography, by William Hughes (*Longmans*). Geography of British History, by William Hughes (*Longmans*). Guyot's Earth and Man (*Parker and Son*). Page's Introductory Text Book of Geography (*Blackwood*). The School Physical Atlas (*either Johnstone's, Philips's, or that published by the National Society*).

XXII.—ENGLISH HISTORY.

Examiner.—(Will be appointed.)

106. English History and English Constitutional History. Text Books:—The Student's Hume. Creasy's Rise and Progress of the English Constitution.

107. Special subject:—The reigns of John and Henry III. Text Books:—Lingard; and Blaauw's Barons' War.

108. The Examiner repeats the suggestion made last year "that candidates should practice themselves in answering questions on papers for their tutors from time to time."

XXIII.—ENGLISH LITERATURE.

Examiner.—Rev. Samuel Clark, M.A., Chairman of the Board of Examiners.

109. Any two, but not more than two, of the authors in the following list may be taken up for examination:—

Chaucer.—The Prologue to the Canterbury Tales.

Shakespeare.—King Lear; Richard III.; As You Like It. Bacon.—Essays.

Trench.—On the Study of Words.

110. Candidates are recommended to make a very careful study of the text of the authors they may select. The questions on each author will be divided into two sections, the first intended to test the candidate's acquaintance with the text, the second his knowledge of the subject-matter and his critical and literary information. Full marks will not be given for answers in the second section, if those in the first section do not prove satisfactory.

111. The Examiner, referring to the last examination, says:—"Two or three of the candidates have wasted their time in making imperfect, though tedious, grammatical analyses of the passages contained in the questions." He adds:—"It should be understood that no marks can be given for anything beyond an answer to the examiner's questions."

XXIV.—LOGIC AND MENTAL SCIENCE.

Examiner.—J. D. Morell, Esq., LL.D., one of her Majesty's Inspectors of Schools.

112. Logic: Candidates will be expected to answer questions on the different processes of thought, and the symbols by which they are expressed. Every Candidate must be prepared to analyse examples of reasoning, and to detect fallacies.

113. Text Books:—Whateley's Elements of Logic, or Thomson's Outline of the Laws of Thought.

114. A Candidate for a second or third-class Certificate will be expected to prepare, in addition, any one of the following books which he may select:—Mill's System of Logic, Book III., of Induction; Sir James Mackintosh's Dissertation on the Progress of Moral Philosophy; or a Manual of Moral Philosophy, by W. Fleming, D.D. (Glasgow). Brown's Lectures on the Philosophy of the Human Mind (first 50 Lectures), or Sir W. Hamilton's Lectures on Metaphysics.

115. A Candidate for a first-class Certificate will be expected to prepare any two of these works which he may select.

XXV.—LATIN AND ROMAN HISTORY.

Examiner.—Rev. F. Temple, D.D., Head Master of Rugby School.

116. Livy, Book I. Virgil; Georgics, Book IV.

117. Roman History to the death of Augustus Cæsar. Text Book:—Liddell's History of Rome, in one volume.

XXVI.—FRENCH.

Examiner.—Alphonse Mariette, Esq., M.A., Professor of French, King's College, London.

118. The Examination paper will be divided into three parts.

119. The first will comprise grammatical questions and an extract from a modern French writer, to be translated into English. Candidates merely aiming at a 3rd class certificate should confine themselves to this first part.

120. The second part will comprise, together with a few grammatical questions, an English extract to be translated into French, and a list of idiomatic expressions to be rendered from French into English, or *vice versâ*. This should be done satisfactorily by the candidate who aims at a 2nd class certificate.

121. In the third part, candidates for a 1st class certificate will have to translate an English extract into French (to which great importance is attached), and to answer properly (*in French*) some elementary questions on the two following subjects:—

1. French literature during the reigns of Louis XV. and Louis XVI.

2. The History of France, from the Treaty of Aix-la-Chapelle, to the Revolution (1748 to 1789).

122. Books recommended:—*Mariette: Half-Hours of French Translation (Williams and Norgate, London and Edinburgh)*. Nisard: *Histoire de la Littérature Française*, vols. 3, 4 (*Williams and Norgate*). Duruy: *Histoire de France*, vol. 2 (*Williams and Norgate*).

XXVII.—GERMAN.

Examiner.—Dr. Wintzer, Teacher of German in King's College, London.

123. The examination paper will consist of three sections. The first will contain extracts or questions from the works recommended for reading; the second grammatical questions and idioms; and the third English phrases; an extract from an English author (both to be turned into German); questions on a certain period of the history and literature of Germany; and a theme to be worked out in German.

124. Each Candidate must translate at least one of the extracts in section 1. First-class Certificates will be given to those only who translate well from English into German, answer in German the few questions on the literature and history of Germany, and write a well-expressed essay on a subject which will be announced to them when they come up for examination.

125. Books recommended:—*Schiller's Abfall der Niederlande* (2^{tes} u. 3^{tes} Buch), Wilhelm Tell; *Goethe's Tasso*; *Kohlrausch's Deutsche Geschichte* (Vierter Zeitraum), and *Vilmar's Geschichte der deutschen National-Literatur* (Alte Zeit, dritte Periode vom Jahre 1517—1624).

126. The Examiner, referring to last year's candidates, says:—"Some of those who have written the essay sometimes deviate from the point in question. A stricter keeping in view of the subject to be handled, and a more logical method of arranging the matter, ought in future to be aimed at."

XXVIII.—ITALIAN.

Examiner.—Signor V. Pistrucci, Professor of Italian in King's College, London.

127. Candidates for first-class certificates will be required to translate into English selections from the following works:—*Dante, L'Inferno*; *Petrarca, Trionfo del Tempo*; *Tasso, La Gerusalemme Liberata*; *Alfieri, Saul and Filippo*; *Monti, Cajo Gracco*. They must also translate into Italian an extract from some English author; answer some grammatical questions; and give the proper or approximate English equivalents for a certain number of Italian idioms.

128. Candidates for second and third-class certificates will be required to translate into English selections from the following modern prose writers—*Foscolo, Botta, and Manzoni*; and to answer some grammatical questions.

XXIX.—SPANISH.

Examiner.—B. B. Aguirre, Esq., Lecturer on Spanish in King's College, London.

129. Candidates for a first-class certificate will have to translate an English passage into Spanish, to render into English or French several idiomatic phrases, and to write in Spanish a short essay.

130. Candidates for a second-class certificate will have to translate from English into Spanish, and to answer several questions upon the Spanish verbs.

131. Candidates for a third-class certificate will have to translate from Spanish into English, and to answer several grammatical questions.

132. Books recommended:—*Spanish Gil Blas*; *Conquista de Mejico*, por Dn. Jose Morales Santistevan; *Trozos escogidos de los mejores hablistas españoles*, por Dn. Carlos Ochoa; *Estudios filológicos*, por Dn. Manuel Martinz de Morentin.—Don Quixote translated into English by Charles Jarvis, Esq.

133.—The Examiner, referring to the last examination, says:—"Most of the candidates have tried for a higher certificate than their knowledge of Spanish seems to warrant, and a few only have complied with the requirements."

XXX.—FREEHAND DRAWING.

Examiner.—F. S. Cary, Esq.

134. In freehand drawing the Candidate will be required to show a practical knowledge of the principles usually applied in the imitation of natural and artificial forms, such as furniture, manufactured articles, ornament foliage, and the human form.

XXXI.—GEOMETRICAL DRAWING.

Examiner.—Thomas Bradley, Esq., Professor of Geometrical Drawing in King's College, London, and of the Royal Military Academy, Woolwich.

135. Practical Geometry, or Geometrical Drawing, required by the Mechanist, Engineer, Builder, and in any way employed in the arts of construction. The Candidate will be examined in Practical Plane Geometry, the construction of right line figures of given area, of curved lines required in the arts, &c.; in Practical Solid Geometry, Elementary Problems on the line, in plane, in space, and their combinations, the representation by orthographic projection of simple solids from conditions, and in the principles of Development as used in the construction of Maps, &c.; and in the Elementary Perspective Projection as far as it is required by the Architect.

136. Text Books:—*Geometry, Plane, Solid, and Spherical (Library of Useful Knowledge)* is especially recommended as a work to be studied on Theoretical Geometry. —*Elements of Geometrical Drawing*, published by the Committee of Council on Education, 2 parts (*Chapman and Hall*). —*Hall's Elements of Descriptive Geometry for Students in Engineering*. *Heather's Descriptive Geometry*. Also the following French Works:—*Eléments de Géométrie Descriptive*, par S. F. Lacroix; *Traité de Géométrie Descriptive*, par Lefebure de Fourcy; *Nouveau Cours raisonné de Dessin Industriel*, par Armengaud, aîné, et Armengaud, jeune, et Amouron; *Bardin's Works on Descriptive Geometry*.

137. The Examiner, speaking of those candidates who failed on the last occasion, mentions the apparent causes of these failures as:—"1st. A neglect of the conditions of the questions, either arising from carelessness in reading them, or from misconception of their import; 2. Neglect of the repeated injunction not to attempt more than the prescribed time allows of being carefully and thoughtfully accomplished; 3. A want of knowledge of the elements of solid or co-ordinate geometry, causing a great loss of time by compelling the candidate to adopt complicated and circuitous constructions instead of the brief and simple ones based on sound elementary knowledge."

XXXII.—THEORY OF MUSIC.

Examiner.—John Hullah, Esq.

138. Notation, the modern modes, intervals, time, signatures, the stave, transposition, modulation, terms, and characters in common use.

139. The Elements of Harmony.

140. Musical History and Biography.

141. Arrangements must be made, in the Previous Examinations by the Local Boards, to test Candidates by oral examination, in their knowledge or appreciation of the sound of musical successions and combinations. A form of the test to be used for this purpose by the Local Board at the Previous Examination, will be sent by the Council to such Local Boards as may apply for it, in due time before the Examination.

142.—The Examiner, referring to the last examination, says:—"Of the few candidates who have not passed, the failure is attributable (as on former occasions) to those having attempted the harmony and counterpoint questions with insufficient or no preparation, to the neglect of those questions which possibly they might have answered correctly."

PRIZES FOR 1866.

THE PRINCE CONSORT'S PRIZE.

143. His Royal Highness the late President of the Society was pleased to offer annually to the candidate who, obtaining a certificate of the first-class in the current year, shall have obtained in that year and the three years immediately preceding it, the greatest number of such certificates, PRIZE OF TWENTY-FIVE GUINEAS, and this Prize Her Majesty the Queen has graciously confirmed her intention to continue. This Prize cannot be taken more than once by the same candidate. It will be accompanied by a certificate from the Society of Arts, setting forth the special character of the Prize, and the various certificates for which it was granted.

144. In addition to the Prizes in Botany offered by the Society of Arts to candidates taking certificates of the First Class, the Council of the Royal Horticultural Society offers three additional Prizes of £5, £3, and £1 respectively to the three candidates being *bond fide* professional Gardeners, who, taking any grade of certificate in Botany, obtain the highest number of marks in that subject.

145. In addition to the Prizes in Floriculture, and in Fruit and Vegetable Culture, offered by the Society of Arts to candidates taking certificates of the First Class, the Proprietors of the *Gardener's Chronicle* offer three additional Prizes of £3, £2, and £1 respectively, for the three candidates, being *bond-fide* professional Gardeners, who, obtaining a Second-class certificate, at least, in Floriculture, or Fruit and Vegetable Culture, shall obtain the highest number of marks in one of these subjects, and also a Second-class certificate, at least, in Book-keeping or Mensuration.

GENERAL PRIZES.

* None of these Prizes will be awarded to a Candidate who does not obtain a Certificate of the first-class in the subject.

1. Arithmetic	{ First Prize, £5. Second Prize, £3.	17.*Fruit and Vegetable Culture	{ First Prize, £5. Second Prize, £3.
2. Book-keeping	{ First Prize, £5. Second Prize, £3.	18. Animal Physiology (in relation to Health)	{ First Prize, £5. Second Prize, £3. Additional by Gift of Harry Chester, Esq.:— Third Prize, £2; and Three Prizes of Books, value £1 each.
3. Algebra	{ First Prize, £5. Second Prize, £3.	19. Domestic Economy...	{ First Prize, £5. Second Prize, £3.
4. Geometry	{ First Prize, £5. Second Prize, £3.	20. Political and Social Economy.....	{ First Prize, £5. Second Prize, £3.
5. Mensuration.....	{ First Prize, £5. Second Prize, £3.	21. Geography	{ First Prize, £5. Second Prize, £3.
6. Trigonometry	{ First Prize, £5. Second Prize, £3.	22. English History	{ First Prize, £5. Second Prize, £3.
7. Conic Sections.....	{ First Prize, £5. Second Prize, £3.	23. English Literature ...	{ First Prize, £5. Second Prize, £3.
8. Navigation and Nautical Astronomy...	{ First Prize, £5. Second Prize, £3.	24. Logic and Mental Science	{ First Prize, £5. Second Prize, £3.
9. Principles of Mechanics.....	{ First Prize, £5. Second Prize, £3.	25. Latin and Roman History	{ First Prize, £5. Second Prize, £3.
10. Practical Mechanics	{ First Prize, £5. Second Prize, £3.	26. French	{ First Prize, £5. Second Prize, £3.
11. Electricity and Magnetism	{ First Prize, £5. Second Prize, £3.	27. German	{ First Prize, £5. Second Prize, £3.
12. Light and Heat	{ First Prize, £5. Second Prize, £3.	28. Italian	{ First Prize, £5. Second Prize, £3.
13. Chemistry	{ First Prize, £5. Second Prize, £3.	29. Spanish	{ First Prize, £5. Second Prize, £3.
14. Mining and Metallurgy	{ Additional by Gift of Sir Thomas Phillips, F.G.S.:— Third Prize, £2; and Three Prizes of Books, value £1 each. First Prize, £5. Second Prize, £3.	30. Freehand Drawing ...	{ First Prize, £5. Second Prize, £3.
15.*Botany	{ First Prize, £5. Second Prize, £3.	31. Geometrical Drawing	{ First Prize, £5. Second Prize, £3.
16.*Floriculture.....	{ First Prize, £5. Second Prize, £3.	32. Theory of Music.....	{ First Prize, £5. Second Prize, £3.

* For extra prizes in these subjects see above.

LOCAL EDUCATIONAL BOARDS.

The following is a List of the places at which Local Boards have already been formed, with the names of the Secretaries, from whom intending Candidates and others may obtain information relative to the Examinations:—

LOCAL BOARDS.	SECRETARIES.
Aberdeen	Mr. James Sinclair, Mechanics' Institution, Aberdeen
Aldershot and Farnham District	Mr. Barrow Rule, M.C.P., Principal of the Classical and Mathematical School, Aldershot.
Alton	Mr. T. Bryant.
Ashford	Mr. T. Nesbit, 3, Dover-place, Ashford.
Banbridge (Ireland) Literary and Mutual Improvement Society	Mr. Alexander Black, Banbridge, County Down, Ireland.
Banbury	Mr. John H. Beale, Banbury.
Barnet	Mr. John Thimbleby, Barnet.
Belfast	Mr. F. A. Maitland, People's Reading Rooms, Belfast.
Birmingham and Midland Institute	Mr. Thos. Martineau, Solicitor, Cannon-st., Birmingham
Bishop's Stortford	Mr. F. Woodham Nash, B.A., Sion House, Birchanger, Bishop's Stortford.
Blandford	Mr. J. B. Green, Architect, &c., Salisbury-street, Blandford.
Bradford	Mr. James Simpson, Mechanics' Institution, Bradford
Brighton (for Sussex)	Mr. Barclay Phillips, 75, Lansdowne-place, Brighton.
Bristol	Mr. F. W. Cross, Athenæum, Bristol.
Bury St. Edmund's	Mr. John Jackson, Head Master of the Commercial School, Bury St. Edmund's.
Canterbury	Mr. W. D. Furley, Canterbury.
Carlisle Mechanics' Institute	Mrs. Jane Williamson, Mechanics' Institute, Carlisle.
Chatham, Rochester, Stroud, and Brompton	Mr. F. Butler, 112, High-street, Chatham.
Chelmsford	Mr. W. Cutts and Mr. Jesse Garrod, Chelmsford.
Darlington	Mr. F. T. Steavenson, Darlington.
Deptford	Mr. T. Earland, 2, Wellington-grove, Greenwich-road.
Derby	Mr. H. M. Holmes, Hon. Local Sec. to the Society of Arts, London-road, Derby.
Devonport	Mr. W. Mogg and Mr. Samuel Chapple, Mechanics' Institute, Devonport.
Faversham	Mr. Frederick W. Monk, Managing Director of the Faversham Institute.
Gilford (Ireland) Young Men's Mutual Improvement Society	Dr. Henry McBride, M.D., Gilford, Co. Down, Ireland.
Glasgow Athenæum	Mr. John Allan, 18, Queen-street, Glasgow.
Glasgow Institution	Mr. John Craig, F.E.I.S., Glasgow Institution, 37, Cathedral-street, Glasgow.
Glasgow Mechanics' Institution	Mr. J. McDougall, 27, Stanhope-street, Glasgow.
Glasgow Popular Evening Classes, Andersonian University	Mr. Geo. Martin, 11, Gt. Western-road, Glasgow.
Gosport and Alverstoke Lit. and Sci. Institution	Mr. William Short, 56, High-street, Gosport.
Greenwich	Mr. Jas. Spencer, 3, Wintown-place, Greenwich, S.E.
Halifax Working Men's College	Mr. Geo. Gibb, Haley Hall, Halifax.
Hartlepool (West)	Mr. Thos. Preston Brutton, and Mr. John Thomas Reek, Solicitors, West Hartlepool.
Hastings and St. Leonard's	Mr. J. C. Savery, 27, Maria St. Leonard's.
Hertford	Mr. J. L. Foster, Hertford.
Hitchin	Mr. Joseph Pollard, Hitchin, near Hitchin.
Hull	Mr. P. Blackmore, Iron People's Institute, Hull.
Ingro-cum-Hainworth	Mr. Jackson, Ingrow-cum-Hainworth.
Ipswich	Mr. Edwin Barrett, 31, Cornhill, & Mr. Herbert Wight, 44, Handford-road, Ipswich.
Knutsford	Mr. G. W. Clarke.
East Lancashire Union of Mechanics' Institutions, Burnley	Mr. John Sutherland, Pa. office, Burnley.
" Haslingden	Mr. J. Binns, Haslingden.
" Rawtenstall	Mr. T. Thomas, Rawtenstall.
Lancashire and Cheshire Union:—	
(Central Board)	Mr. Thomas Lawton, 3, St. James's-chambers, Seel King-street, Manchester.
" Accrington	Mr. W. H. Dewhurst.
" Ashton-under-Lyne	Mr. D. F. Howorth.
" Bacup	Mr. Thos. Newbigging, Bacup.
" Blackburn	Mr. W. G. Prebble.
" Bolton	Rev. J. Lowe.
" Bury	Mr. J. Pomfret.
" Clitheroe	Mr. J. Whitaker.
" Crewe	Mr. George Lord.
" Darwen	Mr. Abel Bradbury.
" Dean Mills	Mr. W. Taylor.
" Haughton Dale	Mr. J. T. Fallows.
" Hyde	Mr. W. Gee.
" Macclesfield	Mr. W. Jeffery, Park-gate, Macclesfield.
" Manchester M.I.	Mr. A. Jawett.
" Mossley	Mr. Aaron Tetlow, Mossley.
" Newton Heath	Mr. E. Teggin.
" Oldham Lyceum	Rev. J. Hodgson.
" Rochdale Lyceum	Major Fishwick.
" Salford	Mr. W. Noar.
" Stayleybridge	Mr. E. B. Newton.
" Tottington (Bury)	Mr. J. Greenhatch.
Leeds Young Men's Christian Association	Mr. W. H. Smith, Y.L. Christian Assoc., Leeds.
Leicester	Rev. D. J. Vaughan, St. Martin's Vicarage, Leicester.

" Stourbridge ...	Rev. J. W. Grier, Amblecote.
" Walsall	Rev. A. C. Irvine.
" Wednesbury ...	Mr. C. Britten.
" West Bromwich	Rev. J. Whewell.
" Willenhall ...	Mr. J. Bennett.
" Wolverhampton	Mr. J. N. Langley, Mowbray House, Wolverhampton.
" Wordsley	Rev. J. Boulton.
Wakefield	Mr. W. S. Banks, Solicitor, Wakefield.
Warminster	Mr. F. Morgan, Warminster.
Waterford	Mr. James Budd, Thomas-street, Waterford.
Wellingborough	Mr. Thos. S. Curtis, Wellingborough.
Whitby	Mr. W. G. Chiesman.
Wigan	Mr. James Seward, Dicconson-street, Wigan.
Woolwich	Mr. W. D. Keeble, Royal Laboratory, Woolwich.
Worcestershire Union of Educational Institutes..	Rev. E. Isaac, Worcester.
York	Mr. F. Marcus, Organising Master.
York	Mr. Chas. Cumberland, Inst. of Popular Science, York.
Yorkshire Union :—	
" Acomb, near York	Mr. T. Copley, Acomb.
" Calverley	Mr. Alfred Walton.
" Crosland Moor	Mr. H. Avison.
" Eccleshill	Mr. B. Baxter, Eccleshill.
" Eston Mines (Middlesbro')	Mr. W. Spencer, Eston Mines.
" Fareley	Mr. D. Hainsworth, Farsley.
" Gieborough ...	Mr. F. W. L. Graham.
" Halifax Mechanics' Institution	Mr. A. C. Foster, Solicitor, 1, Westgate, Halifax.
" Hebden Bridge	Rev. W. Baldwin, M.A., Hebden-bridge.
" Holbeck	Mr. Geo. Tinker.
" Hunslet (Leeds)	Mr. W. Cox, Hunslet.
" Keighley	Mr. C. D. Hardcastle, Keighley.
" Leeds, Mechanics' Institution ..	Mr. J. O. Dayson.
" West Riding Educational Board	Mr. Barnett Blake.
" Middlesbro'-on-Tees	Mr. W. Taylor, Mechanics Inst., Middlesbro'-on-Tees.
" Ossett	Mr. J. W. Greenwood.
" Otley	Mr. H. J. Newstead.
" Queensbury ...	Mr. W. V. Quarby.
" Reeth	Mr. W. Wilkie.
" Rotherham ...	Mr. W. Unwin, Carrier, Rotherham.
" Scarborough ...	Messrs. Thos. Shields and J. Edmond, Mechanics' Institute, Scarborough.
" Slaidburn (Clitheroe)	Rev. D. Jones, Slaidburn.
" Stockbridge (Sheffield)	Mr. H. Robertshaw, Stockbridge.
" Stockton-on-Tees	Messrs. T. W. Hornsby and T. Ainsworth, jun.
" Thirsk	Mr. J. G. Baker, Market-place, Thirsk.
" Wilsden (near Bradford)	Mr. C. Petty, Wilsden.

The foregoing Programme of Examinations is published in a separate form, and may be had gratis, on application to the Secretary of the Society of Arts; a copy will be forwarded to each Institution and Local Board.

Proceedings of Institutions.

GLASGOW INSTITUTION.—From the last report it appears that the number of students and scholars attending the classes during 1864-65 was 894, being an increase of 48 over the previous year. That of these the number attending the various classes was as follows:—Mathematics, 27; free-hand drawing, 37; mechanical drawing, 33; practical mechanics, 36; Latin and Greek, 36; French, 67; grammar, composition, and logic, 77; arithmetic and book-keeping, 124; writing, 32; geography, 3; morning classes, 16; phonography, 13; elocution and English literature, 33; elementary evening classes, 99; ladies' evening classes, 40; dancing, 25; and in the juvenile day classes—Middle, 190; lower, 92; advanced, 16; ladies, 4; free-hand drawing, 92; needlework, 14. That 36 came forward to the preliminary examinations of the Society of Arts, of whom 27 passed, but several were under age. Of the juveniles, 58 came forward to the examination of the Local Board; of them 53 passed, and were awarded 16 first-class certificates, 16 second, and 21 third. The following certificates were awarded in the students' classes:—Practical mechanics, 2; elementary arithmetic, 5; arithmetic, 8; writing and its applications, 9; free-hand drawing, 10; book-keeping, 8; Latin, 2; English grammar and composition, 2; logic, 3. The directors have been obliged to give up the premises they have occupied for the last four years, on account of the heavy rent, and consequent expenditure necessary to maintain the Institution, and have removed to the premises it formerly occupied in 63, Cathedral-street. The income for the last two years has been only about £800—this year £302 7s. 6d., and last year £303 1s. 11d., which could not afford £130 a year for rent and standing expenditure at the fees charged; while the raising of the fees would introduce an entirely different class of students for whom ample accommodation is provided in other places in the city; the change of premises has therefore been resorted to. The report concludes by expressing thanks to the Local Board and to Alex. Craig, Esq., artist, London, for his able representation of the Institute at the Society of Arts Conference.

NORTH-EASTERN LONDON EXHIBITION OF ARTS AND MANUFACTURES.

The opening ceremonial of the above exhibition took place on the 16th instant, at the Agricultural Hall. The Organ-gallery was occupied by Mr. G. W. Martin's choir, augmented for this occasion to a thousand chorists.

The Lord Chancellor arrived at three o'clock, accompanied by the Marquis of Salisbury. At the same time came also the Lord Mayor, attended by Alderman and Sheriff Besley and the usual civic retinue. The Archdeacon of London was also present on the platform, with a great number of the manufacturers and employers of the district. The Lord Chancellor was received on his arrival by Mr. King, the chairman of the Committee, and his colleagues, and conducted to the dais, where the simple ceremonial of the day immediately commenced. A procession was formed, including the Lord Chancellor, the Marquis of Salisbury, the Lord Mayor, and the members of the committee, and a complete circuit and careful examination made of the exhibition. After which, on returning to the dais, prayer was read by Archdeacon Hale, and the Lord Chancellor, at the request of the Lord Mayor, declared the exhibition opened. The next proceeding was the singing by the choir of the chorale composed by the late Prince Consort—"Awake my Glory."

The Lord Chancellor addressed a few words to the company. He had, he said, when first asked to preside on that occasion, expressed, in all sincerity, his doubts of his fitness for the task; but subsequently, when he remembered how few of our leading personages were in town at this season of the year, he determined, however

reluctantly, to accede to the request of Mr. King. Most of them who heard him were old enough to remember the Exhibition of 1851, which owed its existence to the practical wisdom and judgment of the late Prince Consort. He (Lord Cranworth) must confess that at first he was not very sanguine as to the success of that exhibition, but the result showed how much England and the world were indebted to the illustrious individual with whom it originated. At intervals of four and eleven years that exhibition was imitated by our neighbours across the channel, and then the illustrious originator of the 1851 Exhibition approved the plan of that of 1862. Providence in its inscrutable wisdom prevented his royal highness from witnessing the triumph of this work, but one result was the establishment on a more extended basis of the Kensington Museum—in his judgment a most valuable institution, as enabling the working man to study the best models in the finer mechanical arts. However, it was idle to suppose that the 300,000 working men living in the north-east of London could go to Kensington; and, a calculation has been handed to him showing that his visits to Kensington would cost the working man equivalent to two-and-a-half days of his working time. Such being the case, it had been suggested that greater facilities for art studies might be given by the establishment of local museums, and it was the proud distinction of the district in which he then stood that it had taken the initiative in this most important movement. Amongst its population were the makers of horological, philosophical, and photographic instruments; and it was most desirable that they should have within reach such a museum as it was hoped now to establish. In fact, it was an indispensable sequence to free trade; for if we permitted foreign workmen to come in and compete in the English market, it was only fair that the English workman should have the means of studying, and of surpassing, if possible, the points in which his foreign competitor beat him. This could only be done by collecting in a museum specimens of all the artistic workmanship of the world; and, therefore, he trusted the time was not far distant when they would have to open such a collection on the spot where he stood. Another advantage of such a museum, as well as of similar institutions, would be to promote habits of temperance amongst working-men. He was old enough to remember when habits of intemperance were considered to be no disgrace in the very highest ranks of society, whereas now they were completely exploded. He hoped to see similar results amongst working men; but this would lead to them would be, not repressive laws, but the institution of establishments like the present, which would amuse whilst they instructed, and would have the effect of rendering temperance attractive. After one or two further observations, his lordship concluded his address with a Scriptural quotation illustrative of the dignity of labour.

The Marquis of SALISBURY followed with a brief expression of thanks to his lordship for presiding, and the proceedings terminated with the National Anthem, sung in full chorus by the entire company.

PARIS UNIVERSAL EXHIBITION OF 1867.

A new feature has appeared in connection with this Exhibition, namely, the introduction of the literary rather scholastic element. It has not yet taken any definite shape, but it is shadowed forth in a speech delivered by the Minister of Public Instruction, on the occasion of the presentation of the annual prizes to the pupils of the Lycées and Colleges of Paris and Versailles on the 14th instant. M. Duruy says:—

"In eighteen months, the nations will come here from the extremities of the earth to dispute for the palm of peace. A place in that competition will be reserved for you."

"As France will show what she is able to do in industry and arts, it is not right that the University should and out of that great combat. Let us set forth our location in the full light of day, and in seeing the wise intelligent direction under which you are placed, the world will recognise, in her tranquil but confident course, the *Alma Mater* that has borne so many generations on its fruitful bosom. I warn you, then, future laureates of the great competition of 1867, that your works, whatever they may be, will be sent to the Committee of the Universal Exhibition. If Germany, England, Italy, and the other powers will do the same, and on the same conditions, we shall see who is in the best course. It is the dying of one of us, of that Gaul mentioned by Livy, who saved the bravest of the Roman army—*Ostendat eventus uterque* * * * *Sit melior*.

"The lists are prepared; the prize is ready—for the most worthy! In the spirit of the invocation to the young heroes in ancient times, I say, 'Forward! for the honour of the University and of France.'

"To you, professors and illustrious scholars who surround me, I have something more to say. While the immense edifice is being erected within which are to be collected all the marvels of industry, the Emperor desires to see aided by foreign and able hands another monument, to be reared by the very genius of France. Sciences, arts, and letters, telling their own progress and history during the last twenty years, showing the theories which they have set forth; the ideas to which they have given birth; the results which they have discovered and illustrated; the new forms which imagination and art have inherited, in word, what France has thought set side by side with, but she has done, the work of her intellect as well as that of her hands; this will be a grand spectacle, full of interest as regards the past, and full of promise for the future; for the future relies on the past, in order to raise itself still higher, and cannot make good use of the support without well comprehending it.

"Let other nations follow our example in this, and the universal exhibition will be as valuable as the material one, and will have the same happy consequences.

"Although language gives in each country a different form to thought, beneath these diversified dresses are the ideas which compose the common stock from which all humanity draws. Has this stock of ideas increased or diminished during the last twenty years? This we shall learn, and the world will thereby see what direction its efforts ought to take for the future. Remember that it is at the Olympic games that the genius of Greece was reared.

"I trust that this appeal to the world, going forth from the bosom of the University of France, may be successful; but, come what may, let us do our duty.

"To work, then, gentlemen! Hasten the completion what you have in hand, or commence some new labour, order, if possible, to add another leaf of gold to that crown of honour which, in this moral competition, is, I hope, reserved for France."

The idea is novel; the appeal is a bold one, and it is to the educated world to consider how intellect can take its place amongst the competitors of the Olympic games of 1867.

COLONISATION; ITS ASPECTS AND RESULTS.

BY WILLIAM STONES, ESQ.

(Continued from page 598.)

RELIGION.

A review of our colonial system would be incomplete without a notice, however slight, of its bearing upon the religious institutions of the mother country. Most eminent retain a regard to those religious observances which, to some extent, perhaps, peculiar to this country, once the Sunday is generally as much regarded, and, I think even more so, than at home as a day of absolute rest from toil. At first one of the settlers may

have religious services in his own house, then a special room is obtained and fitted up, next a weather-boarded and shingle-roofed church or chapel is reared, afterwards the extravagance is committed of erecting a brick or stone edifice, and lastly, as the colony progresses, a cathedral church rises in ambitious proportions, built in all sympathetic recollection of the time-honoured, hallowed fane of the mother country, and anticipations of future colonial glory. Whatever our special religious opinions may be, from a broad point of view it cannot be questioned that the presence of a number of ministers, educated gentlemen from the universities of the old country, married to wives in whom are combined domestic virtue and refinement, is a great advantage to the colonists. The colonial bishops and their clergy not only constitute fresh centres of religious and intellectual activities, but the bishops being recognised heads through whom the moral wants of the colonial dioceses can be definitely and forcibly brought before the home church, assistance is thus more readily obtainable for the various matters within the range of church action.

The objects of this paper do not permit my entering into details, and therefore I must abstain from more than a mere reference to the operations of the Society for the Propagation of the Gospel in Foreign Parts, the Church Missionary Society, and kindred institutions, some devoted exclusively to the colonies, while others include the colonies in their general working. Nor are the communities outside the Church less energetic than the Establishment; the Wesleyan, London, and Baptist Missionary Societies, all devote great attention to our colonies, several of these bodies having special associations for colonial objects; and in the utmost recesses of her Majesty's dominions the earnest pastors of each and all of the religious communities may be found zealously attending to the spiritual and moral needs of their charges. Circumstances frequently induce or require some of these educated men to devote a portion of their time to the instruction of youth, thereby enabling the children of colonists to become acquainted with learning of a character which otherwise would not be possible in their peculiar and scattered position. And it may here be remarked, to the honour of our colonies, that without exception no money is so readily and unanimously voted as the funds required for introducing educated men as professors and teachers, and carrying out the great principle of educating the children of colonists of every grade. Nor should it be overlooked that in the absence of hospitals, dispensaries, and with medical men sometimes resident at a great distance, the medicine chest and the intelligent advice of the minister are frequently of great service to settlers.

Travelling in a dense forest is always impressive, but most intensely so when camping out on the Sunday. One listens in vain, in the deep solemn silence, for the once familiar "sound of the Church-going bells," and all day long is silence, ever silence. Many a time have I strained the ear to catch again in imagination the dear sound of Saint Saviour's bells, whose sweet peals so oft on Sunday mornings came wafted adown the silent river, making soft and pleasant music to me when a boy in the old home of my father. I envy not him who can hear without emotion the simple tolling of the bell for service in some little backwood settlement, or the well-known strains arising from assembled worshippers, of the Morning Hymn or the Old Hundredth Psalm.

AMUSEMENTS.

It would be quite impossible within our prescribed limits to do more than barely call attention to the fact that the national love of hunting, shooting, yachting, rowing, fishing, racing, gratifies and expends its humour in every part of the world.

Fjords in the extreme of Norway are leased for fishing; African elephants fall by the guns of British sportsmen; and the Indian tiger is brought low by the English rifle; now a crew row a boat all through the rivers of

Europe; and anon a solitary countryman writes a note from the source of the Nile. It might, therefore, be expected that among colonists, who are so frequently thrown upon their own resources, and are naturally very self-reliant and confident, athletic sports would find great encouragement. We note but one or two.

Racing.—Wherever Frenchmen land a café is opened, wherever Englishmen go a racecourse is arranged, and horse races become an institution of the smallest settlement. By these periodical assemblages a spirit of emulation is kept up amongst colonists, the importation of horses of good breed is encouraged, and the mother country is advantaged by the continued demand for horses of repute and character. Some of the highest prices realised at the sales of English horses are paid by colonial buyers, and in every colonial newspaper advertisements may be found relating to horses recently imported from England. In 1864 we exported 4,657 horses, valued at £230,831.

Cricketing.—This peculiarly English sport is planted in every colony, therefore it cannot depend upon climate; it must be in the race. You cannot make eleven German or French boys understand how such violent sustained exertion can be play or amusement; and yet, wherever English men or boys are, there is cricket. So strong is the love of this game that, within the last few years, a professional eleven have been invited, not only to Canada but to Australia, to exhibit their skill, and the speculation was so successful that a second party has since gone out. As another illustration, I may name that in a recent account of Singapore I find the author reports that the trade which in 1853 amounted to £5,000,000, in 1863 amounted to £17,000,000; and, although the European population is very small, some 800 only, they are noted for their wonderfully good dinners, not omitting plum-pudding of Christmas-day, and, he significantly adds, "they keep race-horses, and play cricket in a temperature of 82°." Perhaps their adhesion to athletic sports under trying circumstances may be accepted as an indication of the vigour the thriving community of Singapore throw into all their transactions.

Theatricals.—My remarks on this point will be limited to the presenting of two pictures in connection with the district of our youngest colony—Vancouver's Island. The first is an extract from Captain Cook's voyage, 25th April, 1778:—"The inlet in which our ships were moored is called by the natives 'Nootka,' but Captain Cook gave it the name of King George's Sound. As to the natives, their persons in general are under the common stature, their colour could never be determined positively, as their bodies were incrustated with paint and dirt. They wear a cap in shape of a flower pot, made of very fine matting, ornamented with a bunch of leather tassels, and having a string passing under the chin to prevent its blowing off. Besides their ordinary dresses the natives have some that are used only when going to war or exhibiting themselves to strangers in ceremonial visits. The most usual head-dress on these occasions is a quantity of withe wrapped about the head with large feathers. At the same time the face is variously painted, the upper and lower parts being of opposite colours, and the strokes having the appearance of large gashes; or it is beamed with a kind of fat or tallow, somewhat like carved work. Thus equipped, their ridiculous appearance is heightened when they assume their monstrous decorations. These consist of a great variety of wooden masks applied to the face, forehead, or upper part of the head. Some of the visors resemble human faces, having hair, beards and eyebrows; others represent the heads of birds and various animals, as deer, porpoises, wolves, &c. Such kind of representations exceed the natural size, and are frequently strewed with pieces of mica, which makes them glitter, and augments their deformity. In these imaginary decorations they sometimes run into great excess, and fix large pieces of carved work upon the head projecting to a considerable distance, and resembling the prow of a canoe. Whether these grotesque masquerade ornaments were for diversion,

religion, or intimidation, Captain Cook was uncertain. Sonnets were sung by single performers keeping time by striking the hand against the thigh; a rattle and a small whistle being the only instruments of music which we saw amongst them. The rattle is used when they sing. Here, then we have Vancouver's Island amusing itself in masquerade, music and song; struggling to vie with Rome in its carnival—the great globe between.

Had we visited Vancouver's Island in 1778 we should have been treated to a musical festival of a rattle and whistle. Had it been our fortune to go thither in December, 1864, what kind of amusement would have been afforded us? I quote from the *Times* of the 18th February, 1865:—

"On the 12th December, 1864, those eminent artists, Mr. and Mrs. Charles Kean, commenced an engagement for six nights at the Victoria Theatre, Vancouver's Island, in the course of which they performed 'Henry VIII.,' 'Louis XI.,' 'Hamlet,' 'Merchant of Venice,' 'Macbeth,' 'Othello,' and 'The Jealous Wife.' After the termination of their engagement, which proved successful beyond expectation, the Mayor and members of the Council waited upon them at the hotel and delivered a complimentary address."

A rattle and whistle! Hamlet and Corporation thence! How great the contrast!

Fine Arts.

INDUSTRIAL ART EXHIBITION, PARIS.—The doors of this first exhibition, got up by the new Société des Beaux-Arts appliqués à l'Industrie, were opened, as promised, at the tenth instant, and when the objects are completely arranged the collection promises to be exceedingly interesting. The arrangements of the interior, due to M. Guichard, architect and president of the society, are of excellent taste, the most prominent feature being the new staircase which has already been mentioned in the *Journal*. This improved mode of connecting the body of the building with the galleries is achieved by the construction of two noble flights, of eighty stairs each, in four compartments, commencing at the sides of the west end of the Palais de l'Industrie, and meeting in a bold landing on the western door. The erection itself is in excellent taste, and is decorated with statues, busts, and other works of art. The outer sides of the staircase are also made available for the purposes of the exhibition. The collections are divided into three distinct categories:—Past, the Present, and the Future of Industrial Art. The first of these, the retrospective museum, occupies the western gallery, to which the new staircase directly leads, and will form a fine collection of the productions of bygone times. The Barons Rothschild have sent their enamels, majolica and Palissy ware, Italian furniture, cabinet and other objects from their residences in France and Ferridres; M. Henri Didier and M. Joseph Faure a quantity of beautiful carved wood work; M. Doublé a collection of Louis XVI. furniture; M. H. de la Salle a fine series of antique bronzes; M. Dutuit, some remarkable triptyches and curious illustrations of horology; M. Bailewsky, his Byzantine museum; M. d'Yvon, a series of Florentine bronzes; Prince Czartoriaky has placed the contents of the famous Hôtel Lambert at the disposal of the society, including old regalia of his regal house; curious collections of saddlery and Polish tapestry; Baron Pichou contributes silver ware; Doctor Pioger, Chinese objects; Messieurs Pascal, Davillier, Maillet-Dubouché, Scheffer, de Monville and others, *faïences* of France, Persian, and other manufactures; M. de Nieuwenhuis, M. Saint Seine, and M. Spitzer, collections of arms; A. Lecarpentier, his celebrated museum of antique art of all kinds; M. Techner, some extremely fine historic book binding; and other well-known amateurs, articles of various kinds. The body of the building is devoted to the same

productions of the present day, and promises to present the best collection perhaps yet seen of modern French ironwork, castings, bronzes, gold, silver, and ornamental wares, porcelain, earthenware, furniture, carriages, sculptures in marble, wood, and other materials, terracottas, carpets, tapestry, and other products of industrial art. The third, or future, portion of the exhibition consists of the works of the schools of design, lycées, primary and other schools, and comprises an enormous number of drawings and sketches. This exhibition may be looked upon as a very important prelude to the greater one of 1867, and the society by which it is instituted is patriotically determined to do all it can to gain if possible for France a yet higher place than she has heretofore attained in industrial art. The intention and the friendly rivalry, which is one of its results, are honourable and excellent, and there is this satisfaction respecting such a struggle that, whoever may carry off the greatest amount of honours, all the world will benefit by the advance of each competitor. The field is one in which no dishonour can accrue, and the lottery one in which there are no blanks.

LUXEMBOURG GALLERY.—This gallery is closed at the present moment, for the purpose of hanging the pictures purchased by the Government at the last annual exhibition and during the past twelve months. This will afford an additional attraction to those who visit Paris this autumn.

THE MEETING OF THE FRENCH AND ENGLISH FLEETS.—M. Durand Brager, a well-known marine painter, has been commissioned by the Imperial Government of France to follow the manoeuvres of the combined fleets at Cherbourg, Brest, and Spithead, and to record on canvas the most striking and interesting episodes of this grand naval assemblage.

BRONZES IN FRANCE.—It appears that the bronze manufacturers of Paris have determined to give prizes for which their workmen may compete. They offer £82 for a sculptured work of art; and the same amount for a sculptured ornament; £64 for the best chiselled work; £20 for the best drawing; £24 to the founders who shall turn out the best work; £16 to the best turner; and £12 to the best fitter. There are likewise medals to be given, and "honourable mention" to be made of those who may distinguish themselves. Competitors must send in their works between the 10th and 16th of November next.

Manufactures.

HARDY SILK WORMS.—The disease which has attacked the silk worms in all the silk-growing countries of Europe, and even in China, and upon which some remarks will be found in the *Journal* of the 30th of June in the present year, seems to have produced more ravage than ever this year. It made its first appearance in 1856, and attracted special notice from the Jurors of Class IV. at the Universal Exhibition of 1862. Even before that time experiments had been made towards the introduction of other worms than those which feed on the mulberry tree, and the subject has been pursued in France with much determination, and with fair promise of success. Worms have been introduced which feed on the castor-oil plant, jube, oak, and *Ailanthus*—originally called, by mistake, in France, the *Vernis de Japon*, from the supposition that was the tree from which the Japanese obtained the beautiful varnish which covers their lacquered and other ware. M. Guérin-Meneville, a distinguished naturalist, who obtained a medal for his exhibition of various worms and their products in 1862, and who has since established publication entitled *Revue de Sericiculture Comparée*, in which all the experiments and improvements connected with the production of silk are carefully recorded, has given great attention to the subject, and has been aided in his work by the Acclimatization Society of Paris, as

well as by the Government. In a small house, situated on a waste piece of ground appertaining to the Imperial farm at Vincennes—or rather at Joinville le-Pont, a station beyond Vincennes, on the same line of railway—M. Guérin-Meneville has reared and propagated several new and strange species of worms, and it was he who succeeded in obtaining the first specimen known to have been born in Europe of the gigantic moth of the *Bombyx Atlas* of India, mentioned in the *Journal* of the 4th instant. This splendid moth was unfortunately the only one which was hatched from larvae obtained from the eggs received from India, so that this experiment of acclimatization has been stopped for the present. The moth in question covers a space nearly two-thirds of the size of a page of the *Journal*, and cannot be much less than six inches across at the lower part, from the tip of one wing to that of the other, or under five inches in the other direction; its colours are brilliantly lighted up by metallic reflections, and near the tip of each wing is a mark which closely resembles the eye of the peacock's feathers. It is however the *Bombyx cynthia* or *Ailanthus* silk-worm, introduced into France by M. Guérin-Meneville in 1853, which has attracted most attention. It is now bred in several departments of France, in Italy, and in other countries, and seems to offer promise of the production of a new material of manufacture in England and Ireland. In the *Moniteur Universel* of the 6th of June this worm is announced as being perfectly acclimatized; and a list of the silk-worm rearsers in the provinces who are prepared to supply considerable quantities of the eggs is appended. The *Ailanthus* itself well deserves attention, irrespective of the worms which feed upon its leaves. It has been long known in America, and within a few years has become common in Paris and other parts of France. The extent to which its cultivation has been pushed in the last-named country will be seen by the fact that the Imperial Director of forests ordered, in 1863, no less than four tons of the seed. In fact, it would be difficult now to find a garden, "parc," "square," or pleasure-ground in or near Paris without the *Vernis de Japon*, and two, if not more, of the great Boulevards are planted with it exclusively. It is a showy tree, resembling at first sight the ash, but growing, when placed in good conditions, in a beautiful conical form, and exhibiting great freshness and a charming variety of colour in its foliage; it grows with extraordinary rapidity, and in any kind of soil; supplies good fuel, and its wood is said to compare favourably with that of the oak and the elm. The *Bombyx cynthia* or *Ailanthus* worms are found to succeed out of doors better than under shelter. M. Guérin-Meneville says that the dew is necessary for their success; and he supplies this to the young worms, which he keeps within doors for a few days after they are hatched, on branches of the *Ailanthus* placed in water, by means of a pair of bellows with a reservoir attached, which sends the water in a fine shower on the leaves. The worms seem quite indifferent to the changes in the weather; wind, rain, or frost apparently not injuring them; but of course the cocoon is produced more quickly in genial weather. At the present moment M. Guérin-Meneville has worms of the second family this year half grown or more. Experiments have been made with the *Ailanthus* worms by several gentlemen in England, and doubtless evidence may be obtained from them as to the success both of the tree and the insect. M. Guérin-Meneville says that both flourish still better in the United Kingdom than in France. If this prove to be the case generally, the encouragement of the culture and education of the *Ailanthus* and its consumer would be a great national benefit, especially as the greater part of the duties connected with silk rearing may be performed by women and children and persons of little physical power. The silk produced is not of the fineness and beauty of China silk; on the contrary, it is dark in colour and somewhat coarse, like the Tuscan silk of India; and, in consequence of the cocoon being open at one end, thus allowing the escape of the moth without difficulty, it

will not float on water like that of the true silkworm, and the silk cannot therefore be wound off in the same manner; and moreover the absence of the gummy matter prevents the filaments adhering to each other, so that at present it yields only what is called spun silk; but it is said that M. Aubenas, of Lorient, in France, has invented a method of winding it, which is now being put into practical operation. On the other hand, the alanthus silk bleaches and takes dyes fairly, and thus promises in any case to be a very useful addition to our textile materials; and there is little doubt that manufacturers would soon find the means of bringing it into profitable employment either alone or mixed with other filaments. The best season for planting the alanthus is now approaching, and therefore the time is opportune for the consideration of the subject.

Colonies.

AGRICULTURAL SOCIETY OF NEW SOUTH WALES.—The Annual Exhibition of stock, cereals, and other produce, under the auspices of this association, took place in May, at the Upper Park, Parramatta. Excepting the entries of machinery and agricultural implements, of which there was a remarkable deficiency, the exhibits, in quantity and quality, exceeded expectations. Of imported and colonial-bred cattle there was a satisfactory show; and still more so of blood stock—of colonial-bred stallions, of imported and colonial-bred sheep (the latter being interesting as illustrating the progress of sheep farming in the county of Cumberland), and of pigs. The poultry was particularly noticeable, the Dorking and Poland fowls being most admired, and the other varieties being largely represented. The display of fruits and vegetables was not so perfect as that of former agricultural shows. Two specimens of sugar from Port Macquarie, exhibited by the Rev. E. Holland, together with one of arrowroot and of treacle, attracted much attention—the sugar being of excellent appearance and flavour. Among the extra exhibits was some carefully prepared specimens of silk, shown by Mrs. B. Lee, of Parramatta; preserved fruit, colonial cigars and salt.

SUGAR IN NEW SOUTH WALES.—A Maitland paper says that the new company formed to cultivate this product have taken up one hundred acres of land, and it is very probable that ere long that area will be considerably extended. They have two acres of cane growing, and it was reputed to be in a flourishing condition, more so than that in the same stage of growth on the Queensland plantation. This augurs well for the adaptability of this new product to the soil. By September next they will have fifty acres planted, and the other fifty will be ready by the ensuing year. The company also purpose to plant a quantity of sorghum as an experiment, to ascertain its sugar-producing qualities, though they believe that ultimately the sugar-cane will prove the most remunerative.

PARAFFIN OIL IN NEW SOUTH WALES.—Much attention has been directed to the discovery of the mineral from which paraffin oil can be obtained. Extensive seams of this mineral are said to have been found in different parts of the colony—near Hartley, near Wollongong, and near Maitland. The samples obtained from these seams differ considerably from each other in appearance, in fracture, and in yield, but they have been proved to be available. The seam discovered in the Hartley district is situated in the vale of Clwyd, about four miles from Little Hartley. The seam was discovered in consequence of some pieces of the mineral out-cropping in the alluvium; it is five and a half feet in thickness, and is worked through a tunnel. Experiments have been made which show, it is alleged, that this mineral resembles that worked in Scotland, and known as Bog-head coal. It was also stated that the Hartley mineral was superior to that of Bog-head, in consequence of its yielding a larger quantity of oil, and

also of its freedom from sulphur. Two feet of the seam from this mineral gave, it was said, a greater illuminating power than five feet of gas obtained from ordinary coal. It was estimated that a ton of the mineral would yield about 140 gallons of crude oil. The annual import of kerosene oil into this colony is set down at 200,000 gallons, and that into the whole of the Australian colonies at about a million gallons; and it was confidently believed that the oil could be produced there at a lower price than it could be imported from America, and that therefore an extensive and valuable source of productive wealth would be opened up.

ENGLISH GAME IN VICTORIA.—The acclimatisation of Victoria, of the English hare and pheasant, appears to be successful. At a recent meeting of the Council of the Acclimatisation Society there, a most encouraging statement was given as to the results of the breeding experiment. About 200 pheasants had been reared, and in one pen 13 hares had been counted.

MANUFACTURES OF NEW ZEALAND.—Amongst the recent additions to the works and manufactures of this colony are bleaching and dye works. A carriage factory has recently been established, and although to some project at first appeared somewhat chimerical, a steady and rapidly-increasing business has sprung up. The premises are unpretentious enough, but it is stated some of the gay equipages which are now constantly seen in the streets of Auckland have either been built at this establishment, or have received finishing touches in the construction and repairs. The proprietors, having recently secured skilled labour from the Australian colonies, have been turning out some very superior vehicles. Very considerable progress has been made in the erection of the works at Brickfield Bay, and an announcement had been made by the directors that they would be prepared shortly to light Auckland with gas. The mains through the city have almost all been laid, and connecting pipes are being introduced in most of the principal business premises in the principal streets of the City.

ITALIAN LABOUR IN QUEENSLAND.—A company has been formed for the importation to this colony of a stream of Italian artisans skilled in the production, cultivation, and management of various products suitable to the climate of Queensland, such as olives, citrons, spices, vine oranges, and mulberry trees, and dried fruits, such as figs, raisins, currants, &c., as the climate of this colony and that of the south of Italy are generally said to be similar. The projectors state that the Colonial Minister intend to propose to parliament that a lease over 20,000 acres, in the vicinity of Brisbane, be granted to the company, at a nominal rental, and for a term of ten years, and at the expiration of this period that a free grant be given to the company of all the land that will then have been improved.

Obituary.

SIR WILLIAM JACKSON HOOKER, K.H., F.R.S., F.L.S., D.C.L., director of the Royal Botanic Gardens at Kew died on the 12th inst. He was born at Norwich, in 1791, and from an early youth devoted himself to botanical studies, eventually becoming Regius Professor of Botany in the University of Glasgow. That appointment, however, he gave up for the directorship of the Royal Botanic Gardens at Kew. On the recommendation of Viscount Melbourne, then Prime Minister, he received the honour of knighthood in 1835, and in 1845 received the degree of D.C.L. from the University of Oxford, on the nomination of the Duke of Wellington, the Chancellor. Sir William was the author of "The British Flora," "Flora Borealis Americana," "Icones Filicum," "Genera Filicum," "Musica Exotica," "Flora Exotica," "Muscologia Britannica," &c., and contributed the botanical portion of the work to Admiral Beechey's account of his

voyage of discovery in the Arctic region. He was a member of most of the learned and scientific societies, both upon the Continent and in America, and Knight of the Legion of Honour.

Publications Issued.

LE MOUTON. Paris. 8vo.—The natural history of the sheep, its breeding and management, value, and disease, by M. Lefour, Inspector-General of Agriculture in France.

LES CHEMINS DE FER AUJOURD'HUI ET DANS CENT ANS, ETC., by M. Audiganne, Paris.—A treatise on railways in the financial, industrial, political, and moral point of view, by the author of a remarkable book on the working populations and industry of France.

LA DANSE DES NOCES. Folio; Paris.—A reproduction, in twenty plates, of one of the most curious series of wood engravings of the earlier half of the sixteenth century, the work of Hans Scheufelein, the date of whose birth is supposed to be 1490; he was a pupil of Albert Durer, with whom he worked till 1512, when he went to Augsburg to illustrate the celebrated *Theodoranck*, produced at the expense of Maximilian I. In 1515 he was made burgess of Nordlingen, for his picture of the "Battle of Ethulic," now in the Hôtel de Ville of that city, and his works are well known in Germany; there are three in the Museum of Berlin, and six in the Pinakothek at Munich. The "Danse des Noces" is in fact a marriage procession; one plate represents a platform or tribune with musicians, a fool, and other figures; another, three torch-bearers preceding the bride, who is escorted by two valiers; and each of the others, a lady or gentleman arching or dancing. The style is extremely bold, the figures about ten inches in height, and the costumes and details give the work an interest apart from that of its antiquity and intrinsic value as a work of art. The last of the original editions was published in 1560, and the first probably thirty years previously. The work has been reproduced with great care by Johannes Schrott, from a copy of the first edition in the possession of the Master of the Mint of Hauslab, at Vienna. A biographical notice, by Dr. Andresen, precedes the plates.

Forthcoming Publications.

HISTOIRE DE LEONARDO DA VINCI.—M. Arsène Houssaye, the well-known writer and editor of the *Artiste* Paris, is engaged on a life of the celebrated painter, whose remains were discovered by M. Houssaye at Amboise, and promised in the winter of the present year.

Notes.

BERNARD PALISSY'S FURNACE.—A most interesting discovery has been made beneath that portion of the gallery in the Louvre which joined the Tuileries on the river bank and which is now being re-built. The workmen came upon a large potter's furnace, or oven, which was used under the direction of M. Adolphe Berty, architect, and found to contain a certain number of moulds for the production of statues. A letter is in existence in which Bernard Palissy proposed to Catherine de Medici to construct, in the garden which then adjoined the series, a monumental grotto, decorated with extraordinary figures, of which the writer gives a minute description. The moulds are said to agree precisely with those descriptions, and it is therefore conjectured that Palissy placed his kiln in the immediate neighbourhood of the

grotto to be executed. There was found also amongst other relics, the mould of the bust of a soldier, supposed to have been one of the Queen's Swiss guard, a man of peculiar build. Further researches are being made.

ADOPTION OF ELECTRIC COMMUNICATION BETWEEN PASSENGERS AND GUARDS ON THE SOUTH-WESTERN RAILWAY.—The managing authorities of the London and South-Western Railway have just adopted the system of electric communication between passengers and guards of trains which was brought lately under the notice of the public by Mr. Preece, the telegraphic superintendent of their line. The carriages of the Exeter express are now fitted with the apparatus, and plain directions for its use have been issued. These are as follows:—"In the event of something of a serious nature occurring which urgently requires the stoppage of the train, the passenger may 'break the glass' and 'ring,' by moving the bell handle in the direction denoted by the arrow. Thereby a bell will ring in each guard's van, and also on the engine. When the guards and engine-men hear the bell ring, they will at once look carefully along each side of the train, and in case any violent oscillation be seen, or a carriage be on fire, or other occurrence of a serious character be observed, the train will be stopped as speedily as possible, and when stopped must be protected by signals as prescribed. Should, however, the guard and engine-driver fail to observe anything which really necessitates an immediate stoppage of the train, their duty will be to stop the train at the next station or junction, so as to protect the train when stopped by the fixed signals. When the train is stopped, the passenger who broke the glass and rang the bell will communicate with the guard; but should he fail to do so, the guard will detect the compartment from which the passenger gave the alarm by looking for the broken glass; and, in case the alarm has been mischievously and wantonly given, or from some insufficient cause, the names and addresses of all the passengers in that compartment will be taken, in order that the law may be enforced." The instructions conclude with an earnest request that the passengers will protect the communication from improper and mischievous use, as it is very important that it should not be used without real and urgent necessity.

VENTILATION.—General Morin has lately read a paper before the French Academy, on the means for supplying fresh air to meeting-rooms, places of entertainment, theatres, railway stations, &c. During the summer he has made experiments in connection with the passage of air over water in a minute state of division; through coils of tube surrounded with water; on the action of metallic surfaces; the watering the roofs; and with openings more or less in number arranged both above and below the galleries, &c. But these different means have turned out of little value; continued watering of the roof alone lowered the temperature within the fraction of a degree below that without. M. Regnault remarked that the plan adopted by General Morin does not solve the question, the solution of which he considered to be based, 1st, on the employment for roofing and for the walls, of a double envelope, between which air will circulate brought in through air-drains formed in the soil, and distributed by means of holes made in a number of pedestals a little higher than the heads of the company. The hot external air and the rays of the sun striking on the outer envelope would produce, in a very simple manner, a draft, causing the air to circulate rapidly between the two envelopes. This system had been applied to the building for the Fine Arts department of the Universal Exhibition of 1855, and found to answer perfectly. General Morin agreed with M. Regnault as to the excellence of the double envelope, but he did not put faith in the supply of air through the air-drains in the soil. He thought it of the utmost importance that his system should be applied to railway stations, where the temperature frequently rose to 45° or 48°.

AGE AND VORACITY OF THE PIKE.—A pike, between four and five feet long, and which is believed to be a cen-

tury old, was taken recently at St. Paul en Cornillon, on the Loire. In its stomach were found a double-bladed knife, a small key, and the steel snap of a purse. The fish is being prepared for the museum of Saint Etienne.

FLIGHT OF PIGEONS.—The *Société Colombophile* of Brussels sent twenty cages, containing 680 carrier pigeons, to the Mairie of Bordeaux the other day, requesting that the birds might be let loose on the following morning, at five o'clock precisely. This was done, and the pigeons rose at once to a considerable height in the air, arranging themselves in groups, and, after a few seconds of apparent hesitation, started off towards the north; about a dozen only rested for a few minutes on the Cathedral and Hôtel de Ville, and then made of in the same direction. The distance from Bordeaux to Brussels is about six hundred and sixty miles, and the pigeons reached home at half-past three o'clock in the afternoon of the same day, so that the journey was performed at the rate of sixty-three miles an hour.

Patents.

From Commissioners of Patents Journal, August 11th.

GRANTS OF PROVISIONAL PROTECTION.

Air, mechanism for flying through the—1037—G. W. Rothlieb.
Aerated liquids, receptacle for—1923—M. B. Schumann.
Ammonia, carbonate of—1933—A. P. Price.
Atmospheric change, instrument for indicating—1891—H. A. Clum.
Bedsteads, sofas, and chairs—1912—G. Wilson and J. Goodfellow.
Blige water, &c., ejectors for discharging—1981—A. V. Newton.
Boilers, locomotive and other tubular—1990—L. E. C. Martin.
Bolt screwing machines—1949—W. E. Newton.
Boots, shoes, &c., lacing of—1931—J. H. Johnson.
Breach-loading guns—1888—C. Rosson.
Breach-loading guns, fire-arms and cartridges for—1889—W. Tranter.
Buttons, studs, and solitaires, shank for—1930—H. Wright.
Cable shackle, chain or iron—1036—R. Turner.
Cap frames—1966—R. Wormop.
Capillary attraction, motive power by—1874—J. E. F. Ludeke.
Casks and barrels, air-proof solutions for—1957—W. E. Newton.
Cotton, covers for rollers used in spinning—1901—G. Taylor and J. Crossley.
Crimolines—1974—A. Y. Rehm.
Docks, boating—1692—G. Turton.
Drawing instrument—1854—G. Clark.
Dress shirts and dresses, manufacture of—1188—E. Moore.
Electricity from magnets and induction coils, currents of—1979—A. V. Newton.
Electric telegraph instruments and relays—1654—I. Baggs.
Fabrics for hot press, folding—1809—W. S. Yates and A. Freeman.
Fire, giving alarm of—1994—J. Crean and C. J. Barr.
Flax, &c., preparing machinery for—1077—J. Lawson & E. G. Fitton.
Friction pulleys, &c.—1927—M. J. Roberts.
Gold, testing alloys of—1994—H. Levy.
Gunpowder, compositions similar to—1939—E. Spicer.

Announcements by the Council.

PROGRAMME OF EXAMINATIONS FOR 1866.

In the List of the Secretaries of Local Boards, published in last *Journal*, the following was missed:—

Christchurch..... Mr. Wm. Judd, F.C.S.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The Committee met on June 12, 1866. Present:—H. Cole, Esq., O.B., in the chair; Lord Gerald FitzGerald, Sir John Harington, Bart., Colonel Scott, R.E., Captain Donnelly, Lt.E., Messrs. R. K. Bowley and R. Puttick.

The Right Hon. Sir George Clerk, Bart., examined as follows:—

246. I observe by the Charter of the Royal Academy of Music, there is a Board of Directors and a Committee of Management, but practically, I suppose, they are really the same body?—The Committee of Management is a Committee of the directors.

247. Has that always been the case?—They are practically one and the same. There are not so many directors as are authorised by the Charter.

248. The Charter would seem to have intended that there should be a Board of Directors and a Committee of Management besides; but practically they are the same body?—No: the Directors are all members of the committee: and when there is any important business to transact they are specially summoned to meet.

249. The members of the committee of management are not necessarily directors?—I think they have always been.

250. It seems to be mere matter of form; the two bodies are practically the same?—Yes.

251. Whatever the intention of the charter was, practically it is the same thing?—Yes.

252. They take no part in the professional instruction?—They do not interfere in the details of the musical instruction. Their duty is to attend chiefly to the finances, and to take care that no irregularities are committed; and if there is anything either from neglect on the part of the professors or the students, that is reported

by the principal to the committee, who take such measures thereupon as they judge expedient.

253. Do the subscribers have a voice in the election of directors?—I believe they have; but the subscribers are a very small body.

254. In fact the charter is all but a dead letter?—No; but the directors being a self-elected body fill up the vacancies themselves.

255. Do you consider the public might be induced to take an increased interest in the institution, and furnish funds if they had an interest in the election of the directors and managers?—Perhaps they might, and we should be glad to see such an interest awakened as would give it a greater degree of popularity. At first, when students were educated at a very low fee, it was a matter of favour to admit them, and they were admitted by the votes of the subscribers; but very soon after the establishment of the Academy it was found that the funds were perfectly inadequate to carry it out on the scale first proposed. We were obliged then greatly to increase the fees paid by the friends of the pupils, and it ceased to be a matter of great importance to the subscribers to have a vote. The pupils now are obliged to be recommended by a subscriber, or some person connected with the Academy. At present we are obliged to ask so large a sum that there is very little difficulty with regard to the admission of students, if they exhibit any talent at all, and that evidence makes it scarcely a favour to be admitted into the Academy; and this does to a certain extent weaken the discipline of the officers of the Academy.

256. Did Parliament accompany the late grant to the Academy with any stipulations or conditions?—There were some conditions stated in the Treasury letter, which go to the effect that we should be able to show, with the additional subscriptions we get, the Government grant would be sufficient: that it was not merely giving a grant for two or three years to an institution which was likely to become insolvent in that period.

257. Is the competition for the scholarships public?—It is conducted by the various professors of the Academy, and subscribers are entitled to be present while the competition is going on.

258. Have you any objection to put in a copy of the Treasury letter?—Not the least. (See Appendix, p. 635.)

259. Do the members of the Committee of Management inspect the working of the Academy, or is it left to the principal?—They do not interfere, as I have said, in the details of professional instruction. We leave to

the principal the general superintendence of the Academy. He is the intermediate authority between the Committee and the professors, and he is there the greater part of the day.

260. He is that intermediate authority—not the secretary?—The secretary never had anything to do with that.

261. Who notes down the attendances of the professors?—There is a book kept in the hall, and every professor is required to enter his name as he arrives, and the porter puts in the hour and minute at which he arrives; and on leaving the Academy the professors enter their names in another book to show when they leave, so that there is a complete check upon the time they attend.

262. Referring to the Charter, I find that the number of members may be indefinite?—That means the subscribers; that is, the body corporate may be indefinite.

263. The board of directors is to consist of thirty members?—Yes.

264. Besides these thirty directors there is to be a committee of management of not more than fifteen, nor less than seven? It does not appear from the charter that they necessarily are the same persons?—No.

265. But practically at the present time they are?—We can get no others.

266. Do the Directors or the committee of management appoint the professors?—The directors have attended as a matter of form for many years; they attend one or two meetings a year.

267. Are the Professors paid wholly by fees?—They are paid at so much per hour of attendance.

268. Not according to the number of students?—It is so to a certain extent; because, as they give half an hour's separate instruction to each pupil, a professor who has twice as many as another must attend double the time and receives double the amount of remuneration. They are paid according to the number of students they have under them, because that makes the time.

269. Then a professor has a pecuniary interest in the number of pupils he teaches?—Certainly.

270. Have you any students whose fees are wholly remitted?—I think none at this moment.

271. But you have students who pay different grades of fees?—As a matter of favour some indulgence has been given.

272. You have some who hold scholarships?—We have four scholarships; two King's scholarships which nearly pay the whole expenses of the education. The others pay only about one-third part of it.

273. Should you consider it desirable to increase these scholarships?—Yes: I think it would be a means of inducing promising pupils to remain till their education was completed, which is frequently not the case now from want of means on the part of their friends to keep them at the Academy.

274. Do you think it likely increased subscriptions would be obtained by increasing the number of scholarships?—I think it would be a likely means of doing so.

275. You would have no objection to the funds being increased by some process of that sort?—That would educate at a reduced rate a certain number of pupils, but it would not afford funds for carrying on the general business of the Academy.

276. If the institution was made thoroughly efficient, and very attractive, it is not difficult to conceive that some classes of students, sufficiently rich, would pay fees enough to cover the cost of management, and you might look forward to obtaining from the State a sufficient endowment to establish several scholarships?—The friends of pupils who join the Academy with the intention of devoting themselves to the musical profession can only pay fees which cover the expense of the education. The object of the Academy is to afford the means of more thorough musical education to persons who devote themselves to it professionally. It is not our wish that ama-

teurs should be educated in the Academy at a reduced rate.

277. You would have no objection to amateurs joining the Academy if they paid sufficiently remunerative fees?—I think it might be managed, but I doubt whether it would be expedient.

278. Does the Academy require that they shall be professionals?—It is understood that is their intention either to become public professors or teachers.

279. You have had long experience in Parliamentary life and proceedings. Have you any expectations the Parliament could be induced within any reasonable time to give a grant of £10,000 a year to the Academy?—I cannot say that I have.

280. Perhaps if a more modest request were made, and put upon sufficient grounds, it might be more successful?—I doubt very much at the present time whether any Chancellor of the Exchequer would venture to propose any great increase upon the present grant.

281. Any materially increased assistance from Government must come from an expression of public opinion in favour of it?—Yes; perhaps so.

282. What, in your opinion, would be the result of a Parliamentary committee of inquiry?—A committee of the House of Commons on the subject of music I think would do no good. If any inquiry is made it would be better to have a Royal Commission.

283. You are entirely on the side of the improvement of the present Academy if it can be effected?—We have stated publicly, and distributed circulars to the effect that our object is to have the fullest inquiry into the management, and our desire to adopt any alterations or improvements that may place the Academy upon a more popular basis.

284. If you had premises suitable in all respects free it would aid you materially?—Yes.

285. I believe the authorities of the Academy applied to the Royal Commissioners for the Exhibition of 1862 for their aid in providing a new site for premises at Kensington?—I was deputed by the committee to communicate with the Prince Consort on that subject; his royal highness, I believe, was quite willing to be assigned a portion of ground at Kensington for the purpose; but it was merely as to the site. I explained to his royal highness that it was quite out of our power to erect a building upon it.

286. If, in addition to a site, a building suitable for your purposes were put up on it, you would receive with great satisfaction?—Yes; I should indeed.

287. Then it is not correct, as has been stated, that you have declined the assistance of the Commissioners of the Exhibition of 1861?—No; we do not refuse the smallest donations.

288. We understand that the principal of the Academy has the entire responsibility of the musical education? How long has that existed? Was there at one time a board of professors?—A board was appointed as assessors, to assist the principal in any case he required.

289. The principal has been the only responsible person?—Yes.

290. And he has been the person to appoint the teachers?—He has not had the selection of the teachers at all. He recommends to the committee of management such and such persons should be appointed, and he gives recommendation as to the distribution of the pay to the various professors.

291. Do you think it for the advantage of the Academy that there should be one superintendent only, or that the responsibility should be divided?—I think it better to have one sole and undivided authority.

292. If you appoint a musical professor to the office of principal, he is practically chosen for life, and there would be some difficulty in removing him from it?—It might be difficult.

293. I would ask you whether you do not think it

a disadvantage?—It depends upon a judicious selection being made in the first instance.

294. Is the present principal paid by a salary?—Yes; that is a recent arrangement. We thought it would add to the dignity of the office to pay him a fixed salary, the amount of which is as near as possible what he received as a teacher of harmony in the Academy.

295. Is it not usually found to be the case in educational institutions that they generally succeed better if the masters and teachers are paid according to the success of the institution; at our great schools the success or otherwise is judged of by the amount of income of the principal?—That arises from the number of students and a capitation allowance.

296. Do you think that principle might be introduced with advantage into the Royal Academy of Music?—Only to a limited extent, perhaps; because I do not think it desirable to increase the number of musical teachers in the country beyond a certain limit, as there might be no opportunity for their being absorbed as performers or as instructors.

297. Would you not have the institution grow to any extent possible, within the capabilities of management?—You might go so far as to make the supply of teachers far beyond the demand. We have not come to the limit yet, certainly.

298. Is it your opinion that, in addition to a liberal salary, the principal should be remunerated according to the success of the institution?—I think that would be a very valuable principle; and, perhaps, the best mode of judging of results, that there should be something in the nature of a capitation allowance for each scholar. It might be of service in stimulating the exertions, not only of the principal, but of the other professors altogether.

299. Is it not desirable that you should make periodical reports to Parliament upon the working of the institution, seeing you are now receiving Parliamentary funds?—We may be called upon to do so. I may mention generally we have found great difficulty for years in carrying on the institution in what I consider a perfectly satisfactory manner, from the deficiency of funds. In some respects we have been obliged to reduce our establishment to the lowest point compatible with efficiency, and I am afraid we have to some degree gone beyond that, particularly in dispensing with the services of a general superintendent—not a professional musician—whom we had at one time, and to whom we paid a moderate salary.

300. Now you have only a principal?—That is all.

301. At that time the principal was not salaried?—No.

302. It appears by the paper which has been furnished by Mr. Gimson, of the receipts and expenditure of the Academy, that the cost of each pupil, including maintenance of the establishment, is on an average £45 a year?—That would vary according to the number of students there happened to be in any particular year. If there were a great number of students a small surplus over what is paid for the musical education would be sufficient to maintain the establishment; but some years there are a small number of pupils, and then the expenses divided amongst that small number would be high.

303. Do you consider the amount of musical education given in the Academy in each branch sufficient to complete the pupils?—I should say so if they remained at least three years.

304. Practically do you find that the pupils derive their education during the term they are at the Academy, solely from the Academy, or do you find in some instances they have private tuition besides?—I am not aware of any such cases. Their time is so fully occupied with lessons and practice, and the expenses of the Academy are so much complained of, that I doubt whether any of the pupils go beyond that.

305. Can you give the committee any idea of the average expense for each pupil in an Academy of Music conducted as you would wish it to be, and with a sufficient amount of education?—I say from £40 to £45 a year would be amply sufficient; and if the funds of the Academy amounted to a sufficient sum, we would like a reduced contribution from the pupils.

306. With regard to the amount of fees paid by the pupils, do you consider it to be generally too high?—I am afraid it is too often felt to be so by the parents. We have had cases in which the friends of pupils of great talents have said unless the fees were reduced they would be obliged to withdraw the students.

307. Do you think that might be met by having graduated payments? Or do you think it impolitic to admit students at too low a fee, and that the cheaper you make musical education the more common you make it, and that the tendency would be to lower that class of education?—I think it could hardly be the case with a musical academy. It would make it important to get admission, and there would be a stricter examination. At present no person with talent is refused, at a moderate rate of payment—two-thirds or one-half the usual amount is sometimes taken to induce them to remain till their education is completed.

308. You would be in favour of taking smaller fees in cases of great competency and promise?—Yes; we have done so. In many instances we have agreed to take a smaller amount than the regular fee from pupils who have shown great talent.

309. The amount of annual subscriptions to the Academy do not much exceed £200?—No, they do not.

310. To what do you attribute that small amount of public subscriptions? Is it to want of popularity of the institution?—People do not subscribe money generally, unless they get a *quid pro quo*. What have we to offer? If there were the inducement of attractive concerts it might be different. As it is we have no public inducements to hold out.

311. Could you not hold out the inducement of repeated concerts?—We hold concerts of the pupils, and we find the expenses exceed the receipts.

312. Do you think some system might be devised by which benevolent people of musical tastes, and wealthy, would be disposed to pay at once the necessary fees for the education of a student, and having the right of maintaining a student?—We have had instances of persons undertaking to pay the fees of a student for two or three years.

313. As you are aware there are numerous charitable and educational institutions in which the donation of a certain sum, £100 or £500, as the case may be, entitles the donor to a nomination to the institution; do you not think that plan might be applicable to the Academy of Music?—I think there is hardly sufficient public interest in music to hope much from that source. The Academy would be only too happy if it were so. We should be ready to modify the system in any way that might be thought desirable.

314. Is there any person in the existing governing body of the Academy to make new rules for the regulation of the Academy?—The directors and committee may make bye-laws, not inconsistent with the general provisions of the charter.

315. Would it be in the power of the directors to make a bye-law that persons making a certain donation to the Academy should be entitled to the nomination of pupils?—There could be no difficulty about it, nor do I imagine there could be any objection to it whatever.

The Committee then adjourned.

APPENDIX.

Copy of a Letter from the Lords Commissioners of Her Majesty's Treasury.

Treasury Chambers, June, 29, 1863.

MY LORD,—I am directed by the Lords Commissioners

of Her Majesty's Treasury to acknowledge the receipt of the memorial addressed to the Chancellor of the Exchequer by the directors of the Royal Academy of Music for the grant of assistance from Her Majesty's Government.

Their lordships have also had before them a paper, signed by the Principal of the Royal Academy of Music, forwarded on the 29th of April last, submitting observations and suggestions on behalf of the professors of the Royal Academy of Music, and a memorial of the professors, members, associates, and honorary members of that Institution.

My lords are disposed to agree that it may justly deserve consideration, whether on general grounds it might not be proper to afford some public aid or recognition to the art of music. They are also of opinion that the remarkable extension of taste and knowledge with respect to this art, which has taken place within a recent period, does not of itself dispense with the necessity of special efforts, and of special institutions with a view to the scientific training of well-selected pupils in the principles and practice of the art. It has been found in the case of the general education of the people, that there is much more disposition to support the teacher when trained than to assist in keeping at work the machinery which is necessary for training him. The same thing may be true with such qualifications as the difference of subject suggests in the case of the artist in music.

My lords are therefore disposed to take into consideration, before the estimate of next year is proposed, the question whether some aid or recognition by the state might not fitly be extended to the art of music, and to some institution connected with it.

Undoubtedly the institution which first offers itself to view as presumptively entitled to the benefit of such consideration of the general question, is the Royal Academy of Music, from the high character of the countenance it has enjoyed, from the services it has rendered during a series of years, and from the testimony which has been borne to its merits in the memorial from the Professors of Music to which reference has been made.

It is, however, one thing to aid by money or building an institution already self-supporting and efficient, with a view to its greater and more lasting utility, and another thing to undertake to supply similar support to an institution whose resources appear to be diminishing and wasting away, so that the state might soon, and yet unawares, become virtually pledged to engage to supply both its maintenance and its management.

My lords regret to perceive the extreme aloneness of the present funds of the Royal Academy of Music.

Upon the whole they think it their duty to attach to the statement they have made above in favour of the consideration of the question, the following reservations:—

1. In the event of their taking any step such as has been shadowed out, they remain free entirely to consider what shall be the nature, particulars, and conditions of any aid which it may be proposed to give.

2. In particular, they will deem it necessary to be assured, by sufficient proof, that the institution which may claim to be the immediate recipient of aid is not only one entitled to acknowledgments for past services, but is also in possession of the general confidence of the profession, and is constituted in the most effective manner, and on the most liberal principles for the prosecution of its purposes; or else is engaged in adopting such measures as may entitle it to claim to correspond with this description.

3. They would think it necessary that measures should be adopted by the Royal Academy of Music to obtain a much more extended amount of voluntary support, so as to secure to it the character of an institution having the promise of permanence from its own resources, and seek-

ing not to throw upon the state a task refused liberality, but to obtain by the countenance the funds of the state, power to prosecute its upon a scale more fully adequate to their im-

My lords are quite willing that the Dire Royal Academy of music should make such communication as they may think proper.

I am, My Lord,

Your obedient servant,
(Signed) G. A.

The Earl of Wilton,
Chairman of the Directors of the
Royal Academy of Music.

Proceedings of Institutions

CHATHAM, ROCHESTER, &c., MECHANICS' I
The twenty-eighth annual report says that year there has been no increase of subscription the reverse. The previous report showed the £100 remained over and above the necessary at the close of last year. £46 has been expended purchase of books, which enabled the committee about five hundred fresh volumes in the 1 addenda to the old catalogue was also prepared considerable expense, which has found but few so that its publication has entailed a heavy loss Institution. The statement of the librarian volumes have been issued during the past that the readers must be numerous. The or endeavoring to increase the inducements to join the Institution, and to that end have efforts for the formation of classes, and, that be excluded from participating in their bene of means, it has been determined to issue membership, the price of which shall be quarter throughout the year; and that to it will only be necessary to pay expenses per q tional. A mechanical drawing class is now under Mr. T. Merritt, and a Latin class will be formed immediately, under the Rev. S. of Chatham. Other gentlemen have also k their gratuitous services, so that the com undertake to find a teacher for almost an study which six of the members may expre enter on. The committee point out the b may be derived by entering the classes, and advantages of examinations. One of the c member of this Institution, who took a first-cla and the second prize in arithmetic of three well as a second-class certificate in algebr pleasure not only of receiving these reward hand of the Prince of Wales, and of having signed by Mr. Charles Dickens, as president board of examiners, but of almost directly bel to a clerkship on the Cobham estate, by Darley, who considered these documents q tory evidences of his fitness for the office, doubtless prove a first step to his advancement. The committee, while mentioning that the In been affiliated to the Kent Association, e admiration for the public spirit and energy the chief promoter of this union—Mr. W Faversham, through whose indefatigable e people of that town have obtained an inst may be well taken as a model for the format of a similar character. The greatest effort committee during the past year was that for local exhibition of things curious, beautiful, ing, in the lecture hall; this was a complete an exhibition, although, in a pecuniary an extent a failure, the expenditure having a receipts by about £10.

SLOUGH MECHANICS' LITERARY AND SCIENTIFIC INSTITUTION.—The last report congratulates the members on the continued prosperity of this Society. The total amount receipts for the year was £142 3s. 7d., while the payments for the same period were £125 0s. 3d., leaving a balance of £17 3s. 4d. in favour of the Institution. The Society comprises at the present time 147 members. The committee desire to record their thanks to the President, Mr. Tannton, for the great interest he has manifested in the welfare of the Institution, and more especially for granting the use of Stoke-park to its members for the last 3 years, thereby affording most agreeable recreation and amusement, and at the same time materially aiding the ends of the society. The library contains upwards of 800 volumes, and 1,800 volumes were issued to the members in the past year. The committee hope that as opportunities arise, the friends and supporters of the institution will kindly favour them with donations of books. The committee report the continued success of the drawing class, conducted by Mr. Chapman, assisted by Mr. Swell. This last year there has been a greater number of pupils than formerly, and the attendance especially in the first half of the year very good; on some occasions more than 40 were present at the class meetings, the average attendance throughout the year being about 32. At the Art Examination at Kensington and at the Society of Arts Examination, the students acquitted themselves with great credit. At the Government Science Examination, three members won prizes; others were successful, but having carried off prizes in former years they could not again receive them. A master's certificate has been obtained by Joseph Watson at the November Examination; this now makes six master's certificates in geometrical drawing, and two in building construction, held by the members of the drawing class of this institution. The prizes subscribed for by the friends of the class, known as our "Purchase prizes," are more numerous than last year, eleven having been awarded. The committee are highly gratified by these good results, and feel most thankful to Mr. Chapman, who has devoted himself for many years to the gratuitous instruction of the drawing class. The arithmetic class is successfully continued, and the committee offer their best thanks to Mr. Duncan Shaw for giving his voluntary services in the conducting of it. The attendance upon the lectures was on the whole good. Public readings have been held, each one attended by a numerous and attentive audience.

EXAMINATION PAPERS, 1866.

(Continued from page 610.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held April, 1866:—

LOGIC AND MENTAL SCIENCE.

THREE HOURS ALLOWED.

LOGIC.

1. State in detail what is treated of under the heads of simple apprehension, judgment, and reasoning respectively.
2. What are the predicables, and what the predicaments? Give illustrations of both.
3. What is meant by the comprehension and what by the extension of a term? How are the two related to each other? Give examples.
4. Give the rules of definition and division. When is division false?
5. In how many ways may propositions be converted? Give the rules of conversion for each class of propositions designated by the letters A, E, I, O, respectively.
6. Explain what is meant by the major, minor, and middle terms of a syllogism, with illustrations.
7. Evolve the following sentences into syllogisms,

pointing out in each case the major, minor, and conclusion:—(a). Many of the heathen philosophers recommended persecution, and therefore could not have been good men. (b). Because they are envious and ill-natured the censorious are generally detested. (c). Most of the learned in the fifteenth century believed in witchcraft, and must consequently have been very credulous persons.

8. How many figures are there? Give the special rules of each. In what mood and figure are the following syllogisms drawn? How are they symbolically designated?

All true penitents will find mercy.

Some true penitents have been great sinners.

Some who have been great sinners will find mercy.

Many philosophers have contradicted their principles by their practice.

All who do so are dishonest.

Some dishonest persons have been philosophers.

9. What is an enthymeme, an epicheirema, and a sorites? Give an example of each.

PALEY'S MORAL PHILOSOPHY.

1. State any arguments you can advance for or against a moral sense in man.

2. What is meant by utilitarianism? In what sense is Paley a utilitarian, and how does he differ from others?

3. In what, according to Paley, may we say that human happiness does and does not consist?

4. What is the object, the rule, and the motive of virtue respectively as stated by Paley?

5. Give Paley's definition and division of rights.

6. Give some account of the rise of property. Show its use, and on what specific right it is founded.

MILL'S LOGIC OF INDUCTION.

1. Distinguish between induction strictly so called, and induction improperly so called.

2. Give Mill's view of the law of causation. Is his theory of causation universally held? What other theories have been propounded?

3. Explain the four methods of experimental inquiry according to Mill's analysis, and give the canon of each.

4. What is an hypothesis? What is its use in philosophical inquiry? What errors must be guarded against in its use?

5. Explain Mill's view of the nature and uses of analogy in philosophical researches.

STEWART'S PHILOSOPHY OF THE HUMAN MIND.

1. State any of the advantages arising from the study of the human mind, and the method by which it should be conducted.

2. Give a brief sketch of Reid's controversy on perception, and the conclusions to which he arrived.

3. Give a philosophical definition of abstraction, and then sketch the views of the nominalists and realists respectively.

4. What is meant by the association of ideas? Give a classification of the laws of association.

5. State what Stewart says on the different kinds of memory, and the means by which memory may be cultivated.

6. Distinguish between conception and imagination. Give illustrations of both.

BUTLER'S SERMONS.

1. What does Butler mean by human nature, and of what elements does he affirm it to consist?

2. Give his reasons for asserting the supremacy of conscience as a principle of human action.

3. In what sense may a person who follows his appetites *only*, be said to act contrary to nature?

4. Give a concise abstract of Butler's whole argument, to show that human nature, rightly interpreted, leads invariably to the practice of virtue.

LATIN AND ROMAN HISTORY.

THREE HOURS ALLOWED.

SECTION I.

Translate:—

At regina, nova pugnae conterrita sorte,
 Flebat et ardentem generum moritura tenebat:
 "Turne, per has ego te lacrimas, per si quis Amatae
 Tangit honos animum—spes tu nunc una, senectae
 Tu requies miserae, decus imperiumque Latini
 Te penes, in te omnis domus inclinata recumbit—
 Unum oro: desiste manum committere Teucris.
 Qui te cumque manent isto certamine casus,
 Et me, Turne, manent: simul haec invisa relinquam
 Lumina, nec generum Aenean captiva videbo."
 Accepit vocem lacrimis Lavinia matris
 Flagrantes perfusa genas, cui plurimus ignem
 Subiecit rubor, et calefacta per ora cucurrit.
 Indum sanguineo veluti violaverit ostro
 Si quis ebur, aut mixta rubent ubi lilia multa
 Alba rosa: tales virgo dabat ore colores.

1. Parse fully, giving both syntax and accidence, the words sorte, lumina, lacrimis, genas, cui, violaverit.
2. Give the present and perfect tenses indicative active and the supines of the verbs tangit, committere, manent, relinquam, videbo, dabat.

SECTION II.

Translate:—

Ac velut immissi diversis partibus ignes
 Arentem in silvam et virgulta sonantia lauro,
 Aut ubi decursu rapido de montibus altis
 Dant sonitum spumosi amnes et in aequora currunt,
 Quisque suum populatus iter: non segnius ambo
 Aeneas Turnusque ruunt per proelia; nunc, nunc
 Fluctuat ira intus, rumpuntur nescia vinci
 Pectora; nunc totis in vulnera viribus itur.
 Murraum hic, atavos et avorum antiqua sonantem
 Nomina, per regeque actum genus omne Latinos,
 Praecipitem scopulo atque ingentis turbine saxi
 Executit effunditque solo: hunc lora et juga subter
 Provolvere rotas; crebro super ungula pulsu
 Incita nec domini memorum proculcat equorum.

1. Parse fully, giving both syntax and accidence, the words—partibus, lauro, sonitum, quique, vinci, turbine, provolvere, domini.
2. Give the present and perfect tenses indicative active and the supines of the verbs currunt, rumpuntur, executit, effundit.
3. Explain the construction of "itur," and mention any other verbs that are used in the same way.

SECTION III.

Translate:—

"Saepe audiavi a majoribus natu, qui se porro pueros a senibus audire dicebant, mirari solum C. Fabricium, quod, quum apud regem Pyrrhum legatus esset, audisset a Thersalo Cinea esse quendam Athenis, qui se sapientem profiteretur, eumque dicere omnia, quae faceremus, ad voluptatem esse referenda. Quod ex eo audientes M. Curium et Ti. Coruncanium optare solitos ut id Samnitibus ipsique Pyrrho persuaderetur, quo facilius vinci posset, quum se voluptatibus dedidissent. Vixerat M. Curius cum P. Decio, qui quinquennio ante eum consulem se pro re publica quarto consulatu deoverat: norat eundem Fabricius, norat Coruncanis: qui quum ex sua vita tum ex ejus, quem dico, Decii facto iudicabant esse profecto aliquid naturae pulcrum atque praeclearum quod sua sponte peteretur quodque sprete et contempta voluptate optimus quique sequeretur."

1. Parse fully, giving both syntax and accidence, the words—pueros, Athenis, omnia, Samnitibus, naturae, voluptate.
2. Give the present and perfect tenses indicative active and the supines of the verbs dicebant, faceremus, persuaderetur, vixerat.

8. Explain why audisset, profiteretur, persuaderetur, peteretur, are in the subjunctive mood.

SECTION IV.

Translate:—

"Haec igitur lex in amicitia sancitur, ut neque rogemus turpes nec faciamus rogati. Turpis enim excusatio est et minime accipienda quum in caeteris pecuniis tum quis contra rem publicam se amici causa fecisse fateatur. Etenim eo loco, Fanni et Scaevola, locati sumus, ut nos longe prospicere oporteat futuros casus rei publicae. Deflexit jam aliquantulum de spatio curriculae consuetudo majorum. Ti. Gracchus regnum occupare conatus est vel regnavit is quidem paucos menses. Num quid simile populus Romanus audierat aut viderat? Hec etiam post mortem secuti amici et propinqui quid in Scipione effecerint sine lacrimis non queo dicere. Ne Carbonem quocumque modo potuimus propter ream poenam Ti. Gracchi sustinimus. De C. Gracchiano tribunatu quid expectem non libet augurari: spem deinde res, quae proclivius ad perniciem, quum melius coepit, labitur."

1. Parse fully, giving both syntax and accidence, the words—sancitur, casus, majorum, menses, Carbonem, perniciem.
2. Give the present and perfect tenses indicative active and the supines of the verbs prospicere, effecerint, quae sustinimus.
3. Explain why rogemus, fateatur, oporteat, effecerint are in the subjunctive mood.

SECTION V.

1. What was the duty of the Censor? Mention 2 noted Censors. When was the office instituted, and who opened to the plebeians?
2. Give an account of Spurius Cassius, and of the Agrarian Law which made him famous.
3. What were the laws of the twelve tables? What was their general character?
4. Write a short history of Camillus.
5. What was the original Roman law of debt? How was it modified? and under what circumstances.
6. Give an account of the first Samnite war.

SECTION VI.

1. How was the Roman senate filled in ordinary times? Mention any special cases.
2. Give an account of Tiberius Gracchus.
3. What effect had slavery on Roman politics?
4. Give an account of the fall of Carthage.
5. Write a short history of Sulla.
6. In the time of Julius Caesar was the aristocratic the democratic party the champion of liberty? And why?

(To be continued.)

LEGAL POSITION OF INSTITUTIONS.

The following summary of the Literary and Scientific Institutions Act, 1854 (17 and 18 Vict., c. 112), was prepared for the Yorkshire Union of Mechanics' Institutes and is published for the information of Committees of Institutes generally:—

ACQUISITION OF LAND.

Section 1.—Any person, being seized in fee simple, or for life, or in any manner or lands of freehold copyhold, or customary tenure, and having the beneficial interest therein, may grant, convey, or franchise, by way of gift, sale, or exchange, in fee simple, or for a term of years, any quantity not exceeding one-half of such land, whether built upon or not, as a site for such Institution, as hereinafter described.

Section 38.—The Act shall apply to every Institution for the time being established for the promotion of science, literature, the fine arts, for adult instruction, the diffusion of useful knowledge, the foundation or maintenance of libraries or reading-rooms for general use among the

members or open to the public, of public museums, galleries of art, &c.

Section 5 enables equitable owners to convey without their trustees;—provides for grants of property belonging to infants and lunatics.

Section 6 enables corporations and trustees for public and other purposes to make grants.

Section 12 incorporates 13 and 14 Vict., c. 28:—"An Act to render more simple and effectual the Titles by which Congregations or Societies for Purposes of Religious Worship or Education in England and Ireland hold Property for such Purposes."

Section 13.—All grants, conveyances, and assurances of any site for an Institution under the provisions of this Act may be made according to the form following, or as near thereto as the circumstances will admit:—

"I, or We, [or the corporate title of a corporation] under the authority of an Act passed in the eighteenth year of Her Majesty Queen Victoria, entitled 'The Literary and Scientific Institutions Act, 1854,' do hereby freely and voluntarily, and without any valuable consideration [or do in consideration of the sum of _____ to me, or us, or the said _____]

grant and convey [add, if necessary, enfranchise] to [description of the premises] and all [my, or our, or the right, title, and interest of the _____] to and in the same and every part thereof, to hold unto and to the use of the said _____ and their successors, or of the said _____

his or their [heirs, or executors, or administrators, or successors], for the purposes of the said Act, and to be applied as _____ and for no other purpose whatever; such _____

to be under the management and control of [set forth the mode in which, and the persons by whom, the Institution is to be managed and directed; in cases where the land is purchased, exchanged, or demised, usual covenants or obligations for title may be added]. In witness thereof the conveying and other parties have hereunto set their hands and _____ [or seals only, as the case may be.] this _____ day _____

Signed, sealed, and delivered by the said _____ in the presence of _____

And no bargain and sale, or delivery of seisin, shall be requisite in any conveyance intended to take effect under the provisions of this Act, nor more than one witness to the execution by the conveying party.

SECURITY OF PROPERTY.

Section 20.—Where any Institutions shall be incorporated, and have no provision applicable to the personal property of such Institution, and in all cases where the Institution shall not be incorporated, the money, securities, money, goods, chattels, and personal effects belonging to the said Institution, and not vested in trustees, shall be deemed to be vested for the time being in the governing body of such Institution, and in all proceedings, civil and criminal, may be described as the moneys, securities, goods, chattels, and effects of the governing body of such Institution by their proper title.

Section 21.—Any Institution incorporated which shall not be entitled to sue and be sued by any corporate name, and every Institution not incorporated, may sue or be sued in the name of the president, chairman, principal secretary, clerk, as shall be determined by the rules and regulations of the Institution, and, in default of such determination, in the name of such person as shall be appointed by the governing body for the occasion;

Provided, that it shall be competent for any person having a claim or demand against the Institution to sue the president or chairman thereof, if, on application to the governing body, some other officer or person be not nominated to be the defendant.

Section 24.—In any Institution the governing body, if not otherwise legally empowered to do so, may, at any meeting specially convened according to its regulations, make any bye-law for the better governance of the Institution, its members or officers, and for the furtherance of its purpose and object, and may impose a reasonable pecuniary penalty for the breach thereof, which penalty, when accrued, may be recovered in any local court of the district wherein the defendant shall inhabit, or the Insti-

tution shall be situate, as the governing body thereof shall deem expedient;

Provided always, that no pecuniary penalty imposed by any bye-law for the breach thereof shall be recoverable unless the bye-law shall have been confirmed by the votes of three-fifths of the members present at a meeting specially convened for the purpose.

Section 25.—Any member who may be in arrear of his subscription according to the rules of the Institution, or may be or shall possess himself of or detain any property of the Institution in a manner or for a time contrary to such rules, or shall injure or destroy the property of the institution, may be sued in the manner hereinbefore provided.

Section 26.—Any member of the Institution who shall steal, purloin, or embezzle the money, securities for money, goods, and chattels of the Institution, or wilfully and maliciously, or wilfully and unlawfully, destroy or injure the property of the Institution, or shall forge any deed, bond, security for money, receipt, or other instrument, whereby the funds of the Institution may be exposed to loss, shall be subject to the same prosecution, and if convicted, shall be liable to be punished in like manner, as any person not a member would be subject and liable to in respect of the like offence.

Section 31.—For the purposes of this Act, a member of an Institution shall be a person who, having been admitted therein according to the rules and regulations thereof, shall have paid a subscription, or shall have signed the roll or list of members thereof;

But in all proceedings under this Act no person shall be entitled to vote or be counted as a member whose current subscription shall be in arrear at the time.

Section 32.—The governing body of the Institution shall be the council, directors, committee, or other body to whom by Act of Parliament, charter, or the rules and regulations of the Institution, the management of its affairs is intrusted;

And if no such body shall have been constituted on the establishment of the Institution, it shall be competent for the members thereof, upon due notice, to create for itself a governing body to act for the Institution thenceforth.

EXEMPTION FROM LOCAL RATING.

By the 6 and 7 Vict., c. 36, intitled "An Act to exempt from County, Borough, Parochial, and other local Rates, Land and Buildings occupied by Scientific or Literary Societies," July, 1843, it is enacted:—

Section 1.—No person or persons shall be assessed or rated, or liable to be assessed or rated, or liable to pay, to any county, borough, parochial, or other local rates or cesses, in respect of any land, houses, or buildings, or parts of houses or buildings, belonging to any Society instituted for purposes of science, literature, or fine arts exclusively, either as tenant or as owner, and occupied by it for the transaction of its business, and for carrying into effect its purposes;

Provided that such Society shall be supported wholly or in part by annual voluntary contributions, and shall not, and by its laws may not, make any dividend, gift, or division, or bonus in money unto or between any of its members.

And provided also that such Society shall obtain the certificate of the barrister-at-law, as hereinafter mentioned.

Section 2.—Before any Society shall be entitled to the benefit of this Act, such Society shall cause three copies of all laws, rules, and regulations for the management thereof, signed by the president, or other chief officer, and three members of the council or committee of management, and countersigned by the clerk or secretary of such Society, to be submitted to the barrister-at-law appointed to certify the rules of friendly societies.

One of such copies, when certified by such barrister, shall be returned to the Society, another copy shall be retained by such barrister, and the other shall be trans-

mitted by such barrister to the clerk of the peace for the borough or county where the land or buildings shall be situate, and shall by him be laid before the recorder or justices for such borough or county at the general quarter sessions or adjournment thereof, held next after the time when such copy shall have been so certified and transmitted to him as aforesaid;

And the recorder or justices then and there present are hereby authorised and required, without motion, to allow and confirm the same.

And such copy shall be filed by such clerk of the peace with the rolls of the sessions of the peace in his custody, without fee or reward.

Section 4.—The fee payable to such barrister shall not, at any one time, exceed the sum of one guinea.

Section 5.—In case any such barrister shall refuse to certify the rules as aforesaid, the Society may submit them to the recorder or justices at quarter sessions, who shall and may, if he or they think fit, order the same rules to be filed.

Section 6.—Any person or persons assessed to any rate from which any Society shall be exempted by this Act, may appeal from the decision of the said barrister in granting such certificate as aforesaid to the said court of quarter sessions, within four calendar months next after the first assessment of such rate made after such certificate shall have been filed as aforesaid, or within four calendar months next after the first assessment of such rate made after such exemption shall have been claimed by such Society, such appellant first giving to the clerk or secretary of the Society in question, twenty-one days previously to the sitting of the said court, notice in writing of his intention to bring such appeal, together with a statement in writing of the grounds thereof, and within four days after such notice entering into a recognisance before some justice, with two sufficient sureties, to try such appeal at, and abide the order of the said court, and pay such costs as shall be awarded.

And the determination concerning the premises shall be conclusive and binding on all parties.

RAISING A BUILDING FUND.

In many places there are great difficulties in raising funds for a building for an Institute by donations. It may, therefore, be necessary to add to donations by small redeemable shares payable by monthly instalments. The following is a form of prospectus for that purpose:—

MECHANICS' INSTITUTION BUILDING COMPANY, LIMITED.

CAPITAL, £ _____, in _____ Shares of £1 each.
Deposit, 1s. each Share.

CHAIRMAN.

TREASURER.

DIRECTORS.

THE COMMITTEE OF THE INSTITUTION.

It is proposed to raise a sum of £ _____ for the purchase of a site, and the erection of a building for the Mechanics' Institution, and other public purposes.

All donations and other sums of money available for a building shall be invested in paid-up shares, to be the property of the Institution.

All other shares to complete the amount required shall be paid by monthly instalments of one shilling each share, until the share be fully paid.

Shareholders shall be allowed interest at the rate of 5 per cent. per annum, to commence from the payment of the final instalment.

The Committee of the Institution shall from time to time, as they may be in possession of funds, be allowed to redeem the shares by payment of the full amount to the shareholders, and the shares redeemed shall be the property of the Institution.

In the event of the committee being able to redeem more

shares than the shareholders shall offer for redemption, or if more shares be offered than the committee be able to redeem, the particular shares to be redeemed shall be determined by lot. The building shall be commenced as soon as the required number of shares shall be subscribed for.

Donations to the building fund may be in money or shares. Application for shares may be made to any member of the committee, or to

Secretary.

WEST LONDON INDUSTRIAL EXHIBITION.

The closing of this Exhibition was celebrated by a concert, held in the Floral Hall, Covent Garden, on Monday evening last. The choir of the London Choral Union gave their services on the occasion, as did also various well-known vocalists and instrumental performers.

During an interval of the concert, Mr. J. A. Nisbitt, the chairman, accompanied by Mr. Morell, the secretary, and several members of the committee, appeared upon the platform to present their report to the meeting. From this it appeared that the exhibition was originated on a small scale in Marylebone; but, such was the desire manifested by those interested in it to send contributions to the intended collection, that efforts were made to obtain a large room, and so to increase the magnitude of the display. Failing in several applications to rent public halls the committee determined to build a temporary place on a piece of vacant ground, but in this they were subject to the control of the Board of Works, and ultimately had to abandon the attempt and pay £100 as compensation. Then it was that, after some negotiation with Mr. Gye, they agreed to pay that gentleman £1,000 for the use of the Floral Hall for three months, and to give him the one-fourth of the proceeds of the exhibition. There were no fewer than 1,092 exhibitors. The inaugural ceremony was performed by the Right Hon. W. F. Cowper, First Commissioner of Works, assisted by the Archbishop of York and others. By the terms of their agreement, the committee were obliged to charge one shilling for admission, and to this they attribute a feeling approaching opposition by the working classes themselves, who considered they were practically excluded by this price. There was no counterbalance of patronage by the upper and middle classes, and at length the charge for admission was reduced to 6d. and to 3d. Music, given by amateurs of more than ordinary excellence, was introduced, and proved to be so great a source of attraction that the committee began to entertain sanguine hopes of success. Here (as stated in the report) the agents of the Duke of Bedford, the proprietor of the premises, interfered, and forbade the musical performances, alleging first that the holders of the neighbouring property objected, and secondly, falling back upon the conditions of the lease of Mr. Gye. The hall, therefore, became silent, and was gradually almost deserted. The number of visitors who paid for admission during the three months was 84,283; the receipts from all sources were £1,800; the expenditure is estimated at £3,000. The committee therefore regret that necessity compels them to have recourse to the funds provided by the guarantors; and in concluding their report they thank those gentlemen and all who have rendered aid.

GOLD AND SILVER MONEY IN FRANCE.

The French writers on economical and financial subjects have recently collected much interesting information on the subject of the precious metals coined and in circulation, and on the exportation of gold and silver coin. It appears that during the period commencing with 1803 and ending with 1830 there were struck in France silver pieces of the value of five francs each, to the amount of 2,241,416,740 francs, or £89,656,669 12s. In 1848 the stock of gold and silver in France was of the value of about 80 millions of francs in gold, and 2,150 millions in

ver coin; in 1856 it had risen to 2,304 millions in gold and to 2,576 millions in silver, or together about 195,200,000. A considerable reduction has to be made, however, from this total on account of the money which on various causes was re-coined. Between 1856 and 1865 the quantity of gold and silver in circulation was considerably diminished by French subscriptions to railways and other public works abroad, amounting to about thousand millions of francs, by loans to foreign powers, by expenses in Algeria, Coochin China and other dependencies; by the outlay in the Isthmus of Suez; the purchase of Russian corn, and that of cotton; by the cost of the expeditions to Syria and Mexico; and by the drain caused by the war in America. The actual stock of gold and silver coin in circulation in France in 1864 has been estimated at about £120,000,000.

The import and export of the precious metals, including as it does a considerable quantity of uncoined metal, does not give an exact idea of the increase and diminution in the stock of money, and there is moreover a large amount carried from one country to another by private individuals which does not appear in the official returns. The total amount of gold and silver imported into France, during the period from 1846 to 1864, both included, was equal to £352,960,000, and the exports to £253,723,000, thus showing a large balance in favour of France. The elements for comparison with England are not before us, except for the period beginning with 1858 and ending with 1863, but it appears that during that time, while France received more than twelve hundred millions of francs in excess of her exportation, the imports of the precious metals into England exceeded the exports by rather less than a quarter of that sum. The amounts of the gold and silver in actual circulation in the principal states of the world in 1864 are estimated roughly as follow, in millions of francs:—

	1848.	1856.
France	2,250	4,886
England	1,260	1,665
United States of America ...	1,005	1,200
Holland and Belgium	642	642
Italy	425	605
Spain	460	575
Prussia	445	450
Austria	375	400
Russia	200	450
Sweden and Norway	225	225

The annual yield of all the gold and silver mines in the world is about a hundred millions of francs, of which the gold of Russia, Australia, and California, constitutes considerably more than half, and the silver of America nearly a quarter. Rather more than a quarter of the whole is employed in manufactures, and the rest is converted into money.

The enormous absorption of silver by the eastern states of the world is one of the most remarkable facts in the history of the precious metals. From the earliest historic times the East has taken little else but silver for its commodities. In the time of Pliny, the exportation of precious metals from the West was set down at from £80,000 to £100,000 a year. The Romans had their chief entrepot for the East in the Island of Taprobane, now called Ceylon, and they carried on a considerable commerce with the Indians, Persians, and Ethiopians; the shawls and stuffs of the East found their way to Europe long before the time of the crusades; the Arabs carried on a large and regular trade in these and other Asiatic productions, till the discovery of the Cape of Good Hope diverted the course of commerce; and the establishment of the overland route has operated to some extent in the other direction; but however and by whom the trade has been carried on, the flow of silver has been generally from the West towards the East. Humboldt calculated that in the year 1800, the amount of silver sent eastward annually was between five and six millions sterling. Between 1830 and 1853, the large amount of Sycee silver

received from China, and the export of great quantities of English goods to India, disturbed the flow of silver eastward, which has, however, since set in with more determination than ever. In 1856, the balance in favour of the East was about six millions sterling. The exportation of the precious metals from Great Britain alone, during the seven years ending with 1858, was more than seven millions per annum, of which all but about one-eighth part was in silver. At the present time the balance of the imports and exports of gold and silver in favour of the East is calculated at from twelve to sixteen millions sterling per annum, or more than the total yield of all the silver mines in the world. The enormous production of gold in Australia and California has heretofore enabled the Western nations to part with their silver without great inconvenience, but the present rate of export of the latter seems to demand some new arrangement if any be practicable. Nearly all Orientals are given to hoarding. It is believed, says M. Villiamé, the French economist, that the Egyptians hide away annually nearly four millions sterling. The Emperors of Morocco hold it a point of honour to fill as many chambers as possible with gold and silver; the present Emperor is said to have filled seventeen, and to have another in course of being filled. Morocco never parts with the money it receives; and it is said, on the faith of respectable witnesses, that more than 2,650 millions of francs (£106,000,000) are hoarded away in that country, and that the Emperor's treasure is of the value of at least £40,000,000.

Fine Arts.

PARIS SCHOOLS AND EXHIBITIONS.—The works sent home by the pupils of the French Academy at Rome were exhibited publicly in the new rooms of the School of Fine Arts in Paris on the 17th instant, and were to remain on view until the 24th. The medals and decorations awarded by the jury of the Salon of the present year, and the prizes gained by the pupils in the Ecole des Beaux-Arts, were distributed on the 14th instant by the Minister of the Fine Arts, supported by the various officers connected with the administration of the galleries of art, and the members of the various juries. M. Nanteuil, of the Institute, and M. Amaury Duval, painter, were promoted to the grade of officers of the Legion of Honour; and Messieurs Moreau, sculptor; Langée, Hillemacher, De Curzon, G. R. Boulanger, Chaplin, Protais, and De Winne, of Belgium, painters, were made chevaliers of the same order. In his speech on the occasion, the Minister spoke in high terms of the works exhibited by foreign painters at the last Salon, but claimed for the French School decided superiority in sculpture. He exhorted artists not to be led away by the public taste for works of a secondary character, far too numerous at present, but to give more attention and to lead their pupils to the study of higher art and the cultivation of pure taste. The Minister announced also that in future the productions of the pupils of the schools of Paris and Rome would be exhibited not only, as at present, in the galleries of the Ecole des Beaux-Arts, but also at each succeeding annual exhibition. M. Robert Fleury, Director of the New School of Fine Arts, gave a highly satisfactory account of the progress of that establishment. He referred to the ateliers for painting, sculpture, architecture, and line and medal engraving, and said that they were all in full operation and well attended; that there were evening classes for the study of design; that the number of courses had been increased, and that professors and pupils generally exhibited remarkable zeal. He announced the opening of a large lecture theatre; the commencement of courses of instruction in science applied to the arts, in order to afford young architects a knowledge of the physical laws affecting the materials required in their profession; the establishment of spacious galleries containing

casts from the antique; and the opening of the library of the school. The Commission of the Universal Exhibition of 1867 has given notice to industrial artists, decorative painters, cameo engravers, lithographers, sculptors, decorators, and others, to apply immediately for the space they desire to secure at the Exhibition. The Committee of Admission for this class consists of M. Berrus, shawl designer; M. Braquenie, carpet manufacturer; M. Diéterle, decorative artist; M. Delamarre; M. Labouret, architect; M. Ed. Taigny, maître des requêtes. The gallery at the Luxembourg has been re-arranged, and was re-opened the other day to the public. The following recent acquisitions have been added to the collection:—"Amymoné carried off by Naiads," Giacomotti; "Communion of the Apostles," E. Delaunay; "Saint Jean de Dieu, founder of the order of that name," E. Lafon; "Tobias and the Angel," Gustave Doré; "Hunting in the marshes of Berry," Bussan; "Saint Sebastian," Ribot; "A Fête at Genazano," Archenbach; "A charge of artillery," Scheyer; "The Chase," Aligny; "A landscape," Mademoiselle Sarazin de Belmont; "The Infancy of Bacchus," Ranvier; "A marine piece," M. de Valdrome; "The labourer and children," Duverger; "Les Précieuses Ridicules," Vetter; "Lacemakers at Asnières-sur-Oise," Paul Soyer; "Evening Prayer in the Sahara," Guillaumet. With the exception of the last-named picture, the whole of the above were purchased from the Salon of the present year.

SALE OF THE ESSINGH COLLECTION.—A celebrated collection of works of art and curiosity, that of the late Mr. Antoine Joseph Essingh, of Cologne, is announced for sale in September, commencing on the eighteenth of the month. Mr. Essingh spent a portion of his life in France and the rest in Prussia; he was originally a member of a commercial firm of high standing in Cologne, that of H. J. Essingh and Co., but retired early, and gave himself up entirely to matters of art. The catalogue includes considerably more than two thousand items. There are some very fine engravings; a curious collection of illuminated manuscripts and miniatures; rare examples of German, Venetian, and other glass; china, *faïences*, and pottery, of all countries; some fine enamels; a large collection of Chinese and Japanese productions; carved works in ivory, wood, and stone; a few Greek and Roman antiquities; some remarkably fine specimens of painting on glass; ancient arms, embroidery, furniture, and miscellaneous articles. The pictures are more than 800 in number, and include examples of nearly all the schools—Italian, Spanish, German, Dutch, Flemish, and French.

A PICTURE BY LEONARDO DA VINCI, of the originality of which the owner has no doubt, is now in possession of Mr. C. F. Dennet, of Ladbroke-square, a member of the Society, who is desirous of submitting it to the notice of connoisseurs and others interested in the formation of public or private galleries. The subject is "The Daughter of Herodias receiving the head of John the Baptist."

Manufactures.

MINERAL STATISTICS FOR 1864.—The statistical tables of the produce of the mines of the United Kingdom during the past year have been lately published, having been prepared under the direction of Mr. Robert Hunt, F.R.S. It appears that during 1864, 3,268 collieries in Great Britain and Ireland produced 92,787,873 tons of coal. Of this quantity, 8,890,420 tons were exported, being an increase of 525,208 tons over the exportations of the preceding year. There were 2,351,342 tons brought to London in 1864, and 1,786,713 tons in 1863. 10,064,890 tons of iron ore were produced from the mines of this country, and there were imported 75,194 additional tons. The total quantity fed 612 blast-furnaces, which produced 4,767,961 tons of pig-iron. There were exported 465,951 tons, and the rest was worked up at 127 iron-works, where 6,262 puddling fur-

naces were in action, and 718 rolling-mills. The 192 mines in the South-West of England, and the 30 distributed over other parts of the United Kingdom, produced 214,604 tons of copper ore, which yielded 13,303 tons of metallic copper. The produce of lead ore, principally galena, was 94,438 tons, which yielded 91,283 tons of lead, and 641,088 ounces of silver. Of zinc ore, nearly all being the sulphide of zinc, 15,047 tons were obtained, producing 4,040 tons of metal. Of iron pyrites, used in our sulphuric acid and soda works, there were procured 94,458 tons. The tin mines produced more tin in 1864 than in any previous year; 15,211 tons were raised, which yielded 10,108 tons of metallic tin. During 1864, gold was obtained from five mines in Merionethshire. These produced 2,386 tons of auriferous quartz, which yielded 2,887 ounces of gold; and it is stated that, in consequence of various improvements in amalgamation, due to Mr. W. Crookes, it is highly probable that the production of British gold will be considerably increased during the current year. The gross value of the foregoing mineral products was £39,979,887.

Colonies.

AGRICULTURE IN SOUTH AUSTRALIA.—The approximate agricultural statistics for the year ending the 31st March, 1865, are as follows:—During the year there has been an increase in the number of holdings exceeding one acre of 748; a total increase in the quantity of freehold land alienated from the Crown of 462,264 acres; and a decrease in the quantity of rented land occupied of 14,086 acres. There is an increase in the extent of enclosed land of 786,036 acres; and a decrease in the quantity under tillage of 31,352 acres. Coming to the yield of the following descriptions of crops, it appears that, as compared with the previous year, wheat shows an increase of 531,971 bushels; oats show a decrease of 835,753 bushels; barley a decrease of 13,848 bushels; maize a decrease of 28,514 bushels; rye and bere an increase of 2,278 bushels; peas, beans, millet, and sorghum an increase of 22,394 bushels. On the crop of cereals, peas, and beans there is a total comparative deficiency of 331,982 bushels, chiefly caused by the large falling off in oats. In green crop there has been an increase as compared with the previous year of 17,754 tons, consisting chiefly of potatoes. In hay there is an increase of 24,265 tons. Onions show a falling off of 898 cwt. There is an increase in the number of vines planted of 1,247,728, but a decrease in the quantity of grapes gathered and made into wine or brandy of 1,778 cwt.; and there is also a falling off in the quantity of grapes made into wine or brandy of 1,181 cwt.; and there is also a decrease in the quantity of wine produced of 15,691 gallons, but an increase in the quantity of brandy manufactured of 195 gallons. The average yield of wheat throughout the colony has been 14·7 bushels to the acre; of oats, 18·5 bushels; of potatoes, 1·9 ton; and of hay, 1·1 ton.

COTTON IN QUEENSLAND.—A colonial journal says that the success of cotton growing has this year surpassed all previous experience in the colony. The crop is good in quantity, and the quality excellent. The upland variety appears almost to have superseded the Sea Island in cultivation, a change probably owing to an equalisation of the bonus on either kind, and to the prevailing impression that the latter is harder and therefore better able to stand the chances of the season. Legislative sanction to payment of a bonus of £10 in land orders on every 500 lb. net ginned cotton will expire in December next, but it is to be hoped it will be renewed at least for a year or two to create fresh encouragement owing to the losses during the last season.

FINANCE IN VICTORIA.—The Legislative Assembly has sanctioned a loan of £250,000. This amount was considered necessary by the works on the Geelong line, which

as in very bad repair when it passed into the hands of Government. A loan of £500,000 has also been sanctioned for water supply for the colony generally. Of this amount £50,000 will be handed over to the West commissioners for Ballarat, to complete their works. £50,000 will be set apart for the supply of Geelong, and the scheme for the service of the districts between Melbourne and Epsom is estimated to cost £320,000.

NEW FRUIT IN QUEENSLAND.—Samples of the fruit of the *Flacourtia*, a tree not at present cultivated to any extent in this colony, have recently attracted attention. The fruit grows in clusters, something like the grape, and nearly the size and colour of the black-heart cherry. The *Flacourtia* is stated to be an evergreen shrub, or small tree, growing to the height of 10 feet. It is a native of the East Indies, and perfectly hardy in Brisbane, where it produces its fruit in great profusion. Being covered with a vast number of long thorns, it is well calculated for hedge planting, as it would, if properly trained when young, resist with equal success the attacks of both men and cattle. In its unripe state the fruit is astringent, and its taste somewhat resembles the wild sloe, but as it gets ripe it becomes of a very agreeable flavour. It ripens during April and May. It may be propagated by seeds, layers, and cuttings, the former being the most ready method. It may be planted in any average good garden at 10 feet distances, and, with very little trouble, will form a handsome shrub. The foliage being a dark green, and the young shoots a reddish brown, the effect is very good. There are other varieties, which are said to produce larger fruit, but they are not sufficiently known to warrant an opinion as to their quality and productiveness.

Notes.

SOCIAL SCIENCE CONGRESS.—The fourth session of the Congress to aid the progress of the social sciences, is announced to commence at Berne on the 28th inst., and to terminate on the 2nd of September. The committee announces that the subscription of members is 20 francs per annum, and that the card of membership not only confers the right of participating in the labours of the Congress, but gives the bearer the further advantage of a reduction of one-half the usual rates of conveyance by the Chemin de Fer de l'Est of France. M. M. Guillaumin and Co., 14, Rue Richelieu, are authorized to grant cards of membership, but no London agent of the committee is named in the announcement.

QUEKETT MICROSCOPICAL CLUB.—This club, which is under the presidency of Dr. Edwin Lankester, F.R.S., has been established for the purpose of affording to microscopists, in and around the metropolis, opportunities for meeting and exchanging ideas without that diffidence and restraint which an amateur naturally feels when discussing scientific subjects in the presence of professional men. In the prospectus the promoters say:—"The want of such a club as the present has long been felt, wherein microscopists and students with kindred tastes might meet at stated periods to hold cheerful converse with each other, exhibit and exchange specimens, read papers on topics of interest, discuss doubtful points, compare notes of progress, and gossip over those special subjects in which they are more or less interested; where, in fact, each member will be solicited to bring his own individual experience, be it ever so small, and cast it into the treasury for the general good. Such are some of the objects which the present club seeks to attain. In addition thereto it hopes to organize occasional field excursions, at proper seasons, for the collection of living specimens, to acquire a library of such books of reference as will be most useful to inquiring students; and, trusting to the universal liberality of microscopists, to add thereto a comprehensive cabinet of objects." The ordinary meetings of the club are to be held on the fourth Friday of

every month, at eight o'clock in the evening, at 32, Sackville-street, Piccadilly. In order to place the advantages of this club within the reach of all, the annual subscription has been limited to ten shillings, without entrance fee. The Secretary, Mr. W. M. Bywater, will furnish all further particulars upon application by letter, addressed to 192, Piccadilly, W.

SCHOLASTIC REGISTRATION.—A committee of schoolmasters, appointed to consider this subject, has issued a circular letter containing the principal provisions of the proposed "Scholastic Registration Bill," and giving a statement of the success which the movement in favour of it has already secured. The committee wishes to be prepared to assure the Government and the Legislature that schoolmasters generally are favourable to a Registration Act, and that while they desire to maintain the independence of their profession, and to promote its efficiency, they are equally anxious to advance the interest of education. Signature-sheets, therefore, accompany the letters, to be signed by those who are favourable to the principle of registration. The committee has unanimously resolved, after careful and long deliberation, to withdraw the clause which would prevent an unregistered person from recovering fees in a court of law, and to suggest that any penal enactment be restricted to the assumption by any unregistered teacher of such a title as would signify that he had been registered. The Hon. Secretary to the committee, Mr. Barrow Rule, of Aldershot, will be happy to give further information to any who may apply for it.

MEMORIAL TO THE LATE SIR JOSEPH PAXTON.—A Committee, which includes the Duke of Devonshire, the Duke of Sutherland, Earl Granville, Viscount Palmerston, the Right Hon. W. E. Gladstone, M.P., and many other influential names, has been formed for raising the necessary funds to erect a monument to perpetuate the memory of Sir Joseph Paxton. It is thought that no memorial can be more appropriate than a statue in marble, to be placed in the garden of the Crystal Palace at Sydenham. A most eligible site for this purpose presents itself, in the midst of the beautiful landscape garden with which Paxton's genius and name are so closely associated, and within sight of the Palace itself, and of the residence in which he passed a great part of the last ten years of his life. It is proposed to entrust the execution of the statue to Mr. Spence, of Rome, to whom Sir Joseph sat for a bust within a few months of his death. A general subscription list will be opened and contributions received, which may be of any amount so as to embrace a large number of subscribers, and thus give the memorial as wide and popular a character as possible. Subscriptions, with the name and address of the sender, are requested to be forwarded to Geo. Grove, Esq., Crystal Palace, Honorary Secretary, to whom all cheques and post-office orders may be made payable and postage stamps transmitted. Subscription lists have also been opened at the London and Westminster Bank; the London Joint Stock Bank; the London and County Bank; the Union Bank of London; Messrs. Coutts and Co.; Messrs. Drummond's; and Messrs. Herries, Farquhar, and Co.

HONOUR TO SCIENCE.—The Emperor of the French has lately nominated Mr. Claudet a *Chevalier de la Légion d'Honneur*. Mr. Claudet is one of the oldest members of the Society of Arts, is a Fellow of the Royal Society, and is well-known as the introducer of the Daguerreotype into this country and for his discoveries in connection with it, especially the use of chloride of bromine in the process, by means of which its rapidity was increased one hundred-fold. This discovery was communicated to the Royal Society in 1841, and it then became generally known and adopted. The increased facility thus afforded to the practice of the art helped mainly to bring it so largely into use.

RELIEF IN CANCER.—It is stated that Dr. Brandini, of Florence, has discovered a real alleviation for the torments caused by this malady. In his account of his discovery he says that one of his patients, aged 71, at the

hospital of Santa Maria della Scala, being afflicted with cancer on the tongue, in the midst of his torments asked for a lemon, the juice of which almost immediately diminished the pain. The patient, on finding this, asked for another on the following day, and it gave him still greater relief than before. This led Dr. Brandini to try citric acid itself, in a crystallised state. A gargle was composed of 4 gr. of the acid in 350 gr. of common water, and it entirely carried off the pain; on its reappearing the same remedy was repeated with the same success. In the course of a month this treatment not only delivered the patient from all suffering, but even reduced the swelling of the tongue very considerably. Dr. Brandini had also tried the same remedy in other cases with similar results.

THE EMPEROR'S PRIZE.—The grand prize given by the Emperor for the annual competition of the pupils of the Lycées, or high schools, of Paris and Versailles, is not a mere honorary award, but carries with it substantial benefits; the fortunate winner of it receives a large gold medal, on which his name and the object for which it was given are engraved, and also a copy of the Latin classics, splendidly bound, impressed on the sides with the Imperial arms, and with a special inscription. The Laureate is, moreover, relieved from the conscription—the cost of a substitute being at present 2,300 francs—and he may go through all the studies of the law, medicine, or other schools, without any expense whatever—privileges equal in value to from fifty to sixty pounds a year.

Correspondence.

VENTILATION.—SIR,—The note in your last number on this subject does not lead to any very decided solution of the great problem of how to keep down the temperature of public buildings, or how to furnish a dense crowd with pure air without introducing disagreeable or even dangerous drafts. All the endeavours of General Morin confessedly failed, and the double envelope proposed by M. Regnault would only have the effect of slightly lowering the internal temperature when the building is exposed to the intense heat of the sun, in no way conducting to the supply of pure air, and a mode of construction that would be of no avail during the night hours. Continued watering of the roof is a most vicious plan, because it tends to check the natural elasticity of heated air to rise. As long as we insist on having our ceilings made air-tight with lath and plaster, or otherwise, we shall discover no real or permanent remedy for the heat, stifling air, and water running down the walls of our public buildings, a certain sign of the absence of ventilation, when crowded with human beings. Our courts of law and justice are wretched examples of either total absence of ventilation, or of such miserable expedients as amount to nothing. Their state is much aggravated because the mephitic vapour exhaled by raving counsel, anxious clients, prosecutors, criminals and witnesses, is far greater than under ordinary circumstances. Let the ceilings be of lath only, without the plastering, and so construct the roof as to render it a ventilator throughout every portion of it, then the foul and heated air will rise bodily from the whole area of the room and disperse itself in the atmosphere, while no water will be found running down the walls into pools on the floor as I have frequently seen it. Fresh air is sure to find its way in somewhere, or at any rate a band of perforated zinc several feet broad all round the four walls of the room at a proper height from the floor, would ensure that object. I speak from experience, having been present at a ball, given in the hottest season, in an unfinished building of which the ceilings were only lathed—not plastered—and, notwithstanding the lights and company, the atmosphere of the rooms was as cool as the outward air.—**HENRY W. REVELLEY.**

Announcements by the Council.

EXAMINATIONS FOR 1866.

The Programme of Examinations for 1866 is now published, and may be had gratis, on application to the Secretary. A copy has been forwarded to each Institution and Local Board.

Proceedings of Institutions.

HYDE MECHANICS' INSTITUTION.—The thirteenth annual report says that during the year more than 200 useful works have been added to the library. The Hyde Book Club has again proved a useful feeder to this library, and has contributed its quota towards enlargement, whilst the remainder have been added by private gifts, or by purchase. The collection now approaches 1,900. A new catalogue has been compiled at some considerable trouble and expense. The last report recorded an increase of 50 per cent. in the number of members of the Hyde Book Club; notwithstanding the improvement, however, it was resolved to completely alter the system of management. It has been arranged to abolish the rotation of books, and to establish a book store at the Mechanics' Institution library; to allow members to make their exchanges there at pleasure; to consult the whole of the club as to the choice of books; to issue a quarterly list; and to connect the club with Mudie's Library, so as to have constantly in circulation a proportion of the very newest works. The new plan has resulted in an addition of 25 per cent. of new members. The Elementary Classes have not quite kept up to the numbers and receipts attained to the previous year, which was a nearly four-fold increase upon the preceding one. The attendance has been somewhat interfered with by the precarious nature of trade in the district, and by the opening of several rival classes. French and German Classes have been opened, and the attendance, though small, is very regular. The lecture course has been on the whole well attended and successful, and the committee having charge of this section have been enabled to hand over a surplus to the Institution funds of nearly £18. Encouraged by the support given to the first flower show, the directors resolved to hold a second, upon a more liberal plan. The exhibition resulted, however, in a small loss to the Institution. The success of the day school has been satisfactory. There has been a steady increase in the numbers, and the receipts paid by

the teacher for accommodation prove a small auxiliary to the funds of the Institution. The efforts made by the directors to establish annual flower shows of a superior character, have led to the formation of a "Cottage Gardeners' Association" in connection with the Institution, and a considerable number of members have been enrolled. Besides paying off a small debt, due to the treasurer at the commencement of the year, of £6 1s. 2½d., the directors have been enabled to meet the various charges of the year, to extend the working of several of the departments of the Institution, and to announce a balance in the hands of the treasurer of £24 11s. 3d., the income having been £250 18s. 5d.

EXAMINATION PAPERS, 1865.

(Continued from page 638.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

FRENCH.

THREE HOURS ALLOWED.

PART I.

Candidates for a Third-class Certificate are requested to translate into English the following extract, and to answer the grammatical questions thereto annexed, in the order in which they are placed. This first Part is all that will be expected of them.

Translate into English:—

L'Ermite Pierre traversa l'Italie, passa les Alpes, parcourut la France et la plus grande partie de l'Europe, embrasant tous les cœurs du zèle dont il était dévoré. Il voyageait monté sur une mule, un crucifix à la main, les pieds nus, la tête découverte, le corps ceint d'une grosse corde, couvert d'un long froc et d'un manteau de l'étoffe la plus grossière. La singularité de ses vêtements était un spectacle pour le peuple; l'austérité de ses mœurs, sa charité, la morale qu'il prêchait, le faisaient révérer comme un saint.

Il allait de ville en ville, de province en province, implorant le courage des uns, la piété des autres; tantôt il se montrait dans la chaire des églises, tantôt il prêchait dans les chemins et sur les places publiques. Son éloquence était vive et emportée, remplie d'apostrophes véhémentes qui entraînaient la multitude. Il rappelait la profanation des saints lieux et le sang des Chrétiens versé par torrents dans les rues de Jérusalem; il invoquait tour à tour le ciel, les saints, les anges, qu'il prenait à témoin de la vérité de ses récits; il s'adressait à la montagne de Sion, à la roche du Calvaire, au mont des Oliviers, qu'il

faisait retentir de sanglots et de gémissements. Quand il ne trouvait plus de paroles pour peindre les malheurs des fidèles, il montrait aux assistants le crucifix qu'il portait avec lui; tantôt il se frappait la poitrine et se meurtrissait le sein, tantôt il versait un torrent de larmes.

Le peuple se pressait en foule sur les traces de Pierre. Le prédicateur de la guerre sainte était partout reçu comme un envoyé de Dieu; on s'estimait heureux de toucher ses vêtements; le poil arraché à la mule qu'il montait était conservé comme une sainte relique. A sa voix les différends s'apaisaient dans les familles, les pauvres étaient secourus, la débauche rougissait de ses excès; on ne parlait que des vertus de l'éloquent cénobite; on racontait ses austérités et ses miracles, on répétait ses discours à ceux qui ne les avaient point entendus et qui n'avaient pu s'édifier par sa présence.

MICHAUD, "Histoire des Croisades."

1. Parse the first two sentences of the above extract.
2. Write the five primitive tenses of all the verbs contained above, each verb to be given in a separate line.
3. Put the article and a suitable epithet before each of the following nouns, so as to show its gender:—*Exercice, sèle, arbre, feuillage, dent, rage, peur, tonnerre, nef, crépuscule*.
4. Give the adjective that corresponds to each of these substantives which occur in the extract:—*Cœur, main, corps, singularité, austérité, mœurs, ville, province, courage, pitié, église, lieu, sang, ciel, ange, guerre, poil, voix, excès, vertu, miracle*.
5. What remark does the spelling of *voyageait* suggest (4th line of the extract)?
6. What peculiarities of orthography are there in the conjugation of such verbs as *avancer, essayer, révéler, épeler, rejeter*?
7. *Les pieds nus* (4th and 5th lines). There is another way of expressing *bare-footed* in French. State how this other construction affects the article and the spelling of *nus*. To what other adjective does the same rule apply?
8. Explain the spelling of the past participle *entendus* in the last line but one.
9. *Le poil arraché à la mule, &c.* The preposition *à* will here be rendered by "from." Can you name other verbs after which the preposition *à* is thus used, instead of *de*?
10. *Les différends s'apaisaient dans les familles* (sixth line from the end). Show by several similar examples how much more frequently the reflexive voice is used in French than in English.
11. Write, with all their variations of form, according to gender and number, the words which correspond in French to *my, thy, his, her, its, our, your, their; mine, thine, his, hers, its, ours, yours, theirs*.
12. Give, with suitable examples, any three important rules on the syntax of the verb in French, comparing or contrasting that language with your own as much as possible.
13. Write the French names of:—1. The most common animals, domestic and others; 2. Flowers and vegetables; 3. Trees and fruits; 4. The principal pieces of furniture of a house; 5. The most common metals and minerals.
14. Conjugate the preterit, the imperative, and present subjunctive of the verbs *devenir, se repentir, se prévaloir, and mettre*.

PART II.

Candidates for a Second-class Certificate are to answer the questions Nos. 9, 10, 11, and 12 in Part I., together with those in Part II., and to translate the English extract and idiomatic expressions which follow.

1. What is the exact purpose of the pronoun *vous* in the following quotation?

Maint estafier accourt; on *vous* happe notre homme,
On *vous* l'échine, on *vous* l'assomme.

LA FONTAINE.

2. Explain and correct the mistake in the following construction of the pronoun:—*Il n'entendra pas raison, il n'a jamais voulu l'entendre.*

Si vous voulez qu'on vous rende justice, rendez-le aux autres.

3. Give, with examples, all the rules for the use of the subjunctive mood in French.

4. What is the difference of meaning implied by the difference of spelling in these two expressions?

Le peu de bonté qu'il m'a *montré*.....

Le peu de bonté qu'il m'a *montré*.....

Complete the sentence in each case.

Translation:—

As Sir Roger is landlord to the whole congregation, he keeps them in very good order, and will suffer nobody to sleep in it besides himself; for if by chance he has been surprised into a short nap at sermon, upon recovering out of it he stands up and looks about him, and if he sees anybody else nodding, either wakes them himself, or wakes his servants to them. Several other of the old knight's particularities break out upon these occasions. Sometimes he will be lengthening out a verse in the singing Psalm half a minute after the rest of the congregation have done with it; sometimes, when he is pleased with the nature of his devotion, he pronounces "Amen" three or four times to the same prayer; and sometimes stands up, when everybody else is upon his knees, to count the congregation, or see if any of his tenants are missing. The authority of the knight, though exerted in that odd manner which accompanies him in all circumstances of life, has a very good effect upon the parish, who are as polite enough to see anything ridiculous in his behavior; besides that, the general good sense and worthiness of his character make his friends observe these little singularities as foibles, that rather set off than blemish his good qualities. As soon as the sermon is finished, nobody presumes to sit till Sir Roger is gone out of the church. The knight walks down from his seat in the chancel between a double row of his tenants, that stand bowing to him on each side, and every now and then inquires how such a one's wife, mother, or son, or father do, whom he does not see in church; which is understood as a secret reprimand to the person that is absent.

ADDENDUM.

Idioms:—

1. Tenez-le vous pour dit.
2. Il ne sait où donner de la tête.
3. Il nage entre deux eaux.
4. Je n'ai pas mes coudées franches.
5. Ils travaillent à qui mieux mieux.
6. On lui a coupé l'herbe sous le pied.
7. Poussez-leur l'épée dans les reins.
8. Vous n'y allez pas de main-morte.
9. J'en ai de reste.
10. Nous sommes logés à la même enseigne.
11. Prenez la balle au bond.
12. Je suis des vôtres.

PART III.

Candidates for a First-class Certificate are expected to translate the above idioms and the extract (down to "missing" only), and to answer, in French, the grammatical questions Nos. 1, 2, and 4 (Part II.), as also the following:—

Literature.—1. State what you know of either Rollin or Bayle.

2. Give a short account of any one work of Fénelon, Massillon, or Louis Racine.

History.—Write a *résumé* of the last fifteen years of the reign of Louis XIV.; or, if you prefer it, dwell at some length upon any one important event of that period.

(To be continued.)

MUSICAL FETE AT DRESDEN.

During the early part of the week ending 29 July in the town of Dresden was thrown into a state of excitement by a "Sänger Fest," or Monster Choral Meeting, of a magnitude unprecedented in this or perhaps in any other

untry. A building somewhat resembling in style those at have been raised of late years in England and elsewhere for industrial exhibitions, and capable of containing over 26,000 persons, had been constructed, on purpose for the occasion, on the right bank of the Elbe, about a mile from the town. Being intended for a music hall, it was built of wood, and the interior was decorated with paintings and transparencies illustrative of German history and art. Nearly one-half of the ground-floor was occupied by an orchestra, calculated to contain 12,000 singers, besides instrumental performers, the remainder of the space being left to the audience, for the upper classes of which were also galleries, which ran round the greater part of the building. The exits and entrances, as well as the ventilation, were admirably managed, so that, notwithstanding the heat of the weather, little inconvenience was felt from it, as any spectator who wished to go into the open air could easily do so from any part of the building. The singers, who were to take a part in this great national festival had been invited from every time and region where Germans are to be found. Each of these choral bands was preceded in the great procession by a silk banner, showing whence they came; and on each might be read, not only countries like Hungary, Schleswig-Holstein, and others bordering on Germany, but Australia, New York, Cincinnati, and even China. All these choral societies had been supplied with the music and parts which they were expected to sing, and, as, as they came prepared, it was not so impracticable might have been expected for the conductor to direct a vocalization of this monster chorus.

On Monday, which was the great day of the Festival, the singers assembled under their respective banners in a central place in the town, near the residence of the minister, M. de Beust, and thence they walked, eight abreast in procession through the principal streets and over the bridge to the great Music Hall. The streets were admirably kept, no carriage being allowed in those rough which the procession passed, and some idea of their numbers may be formed from the fact that, although marching quick step, and with little incidental interruption, the procession occupied four hours and a half in passing. Notwithstanding the cheers and the flowers with which they were greeted from almost every window and which they passed, and the more substantial solace of beer offered them from many an open door, the greater part of them must have been greatly oppressed with heat, dust, and fatigue before they reached the Music Hall. Nevertheless they sang lustily through the evening, and the effect of some of the National German ballads, sung by eleven or twelve thousand voices in chorus will not easily be forgotten by any one present who had any feeling for music.

PARIS UNIVERSAL EXHIBITION OF 1867.

The Imperial Commission has issued a series of regulations concerning the important section of the Exhibition which is devoted to objects specially connected with the amelioration of the physical and moral condition of the population—such as, the means and methods of infant education; books, and other means, for adult and family education; economic furniture, clothing, and articles of food; popular and working costumes; cheap habitations; implements, tools, processes, &c. These regulations only apply to French exhibitors, but they furnish hints for all the world.

Seven committees have been formed for the admission of objects in this section; and five of these committees are charged, moreover, with the task of arranging a preparatory exhibition, which is to take place in the Palais de l'Industrie, in the Champs Elysées, but will not be open to the public.

The whole of the expenses of arrangement will, in the use of this preparatory exhibition, be borne by the Imperial Commission. No articles will be admitted to

this section of the French portion of the Universal Exhibition but such as have been previously received into the preliminary exhibition, but objects which, on account of their weight, size, or other circumstances, are difficult to transport, will be examined by the committee, or its delegates, at the producer's house.

Measures of this character tend greatly to produce that completeness for which the French exhibitions are already remarkable; and it is certainly the duty of every nation to consider how the most complete collection may be made in each of its sections and classes. From the very nature of some articles such preliminary exhibitions would be next to impossible, and comparatively useless, if practicable, while in others, the position of this country, amongst exhibiting nations, will depend in a great measure on the soundness of the preliminary steps that may be taken. There have been many admirable local exhibitions of late in England, and it is worth consideration whether the intervening time might not be well occupied by preliminary exhibitions of various kinds, for it is not the country that sends the largest amount of contributions, but that which sends the choicest and best arranged collection, which will make the best figure. A superabundance of objects diverts the attention from the most important amongst them; while a well-conceived and well-executed plan sets everything off to the best possible advantage.

England has a year before her for preparation; her resources are immense, and she ought to make the most of the opportunity, and show the world in 1867 that her skill, science, and art have been advancing with her trade and commerce.

The Imperial Commission has adopted a different system for its working than that which has hitherto been employed on such occasions in France; the central administration only employs at present between twenty and thirty persons, and much of the preliminary work at least, will be done by local and special committees. Ninety-five committees, or juries of admission, corresponding with the number of classes in the arrangement adopted, have been appointed to receive and consider the applications for space. These committees consist principally of men of science, artists and manufacturers, with whom a few officials and men of letters are associated, and they form together a body of four hundred persons well and honourably known to the public. In each department of the empire also a committee has been formed to aid the Imperial Commission with its local influence. These arrangements, together with the guarantee fund, give to the coming Exhibition more of a national character than its predecessors, and there is no doubt that the effect will be salutary.

There is another project spoken of which also indicates a tendency towards decentralization. It is said that it is not proposed to establish a general system of supplying motive power, but to make the motors themselves, with their appurtenances, a portion of the Exhibition. This has already been done, partially, at previous exhibitions; but the Imperial Commission contemplates its general application. The plan spoken of is to divide the machinery gallery into sixteen sections, and to entrust the supply of the necessary power to those who offer the most advantageous terms.

The Champ de Mars, where the building for the Exhibition is to be erected, is now being fenced in, and the drainage commenced. The outline plan of the building and its arrangements has appeared, and seems to meet with general approval. The building itself is to be of an obtuse ovoid form, the centre being occupied by a garden, and the various groups and sections of the Exhibition being ranged round in zones, the fine arts occupying the place next the central garden and the machinery the outer zone. Each country will occupy a space enclosed by radii of the oval, the distance between which will of course be regulated by the amount of contributions. The building will occupy only the central portion of the

Champ de Mars; the rest of the ground is to be planted as a park, enclosing the buildings for the exhibition of cattle, model cottages, and other things requiring much space. But the building itself will be brought into direct communication with the main roads which pass near it, and also with the river, by means of broad covered ways on the line of the main axis of the building, so that in case of bad weather the public will be under shelter from the extreme limits of the Exhibition. This will be a great convenience, especially to ladies, children, and invalids.

ON THE COMMERCIAL USE OF FLOWERS.

By EUGENE RIMME

(Author of the "Book of Perfumes," &c.)

The following lecture, illustrated with practical experiments, was delivered before the Royal Horticultural Society on the 27th of July:—

Flowers are a source of pleasure and gratification to all, be they learned or ignorant; to many they offer particular attractions as an object of cultivation and study; for a few only they possess considerable importance as an article of commerce. It is on this point of view alone that I shall have the pleasure of addressing you to-day.

We are all led by a natural instinct to enjoy the pleasant odours diffused by fragrant flowers and plants. The humble floweret which blooms wild in the plain or on the mountain shares equally with its prouder sister which ornaments our garden the privilege of embalming the air, and of creating on our minds a cheerful impression. This charm, however, is of short duration; the flower soon fades and droops, the plant dries and sheds its leaves; and were not some means adopted to save their aromatic treasures in all their vitality and strength, we should be left, especially in northern climes, entirely deprived of "sweet smells" for many a long dreary month. To the art of perfumery we are indebted for this miracle, and for reviving in the middle of winter the enjoyments of the floral season; for, as Shakespeare says:—

"Then were not Summer's distillation left,
A liquid prisoner pent in walls of glass,
Beauty's effect with beauty were bereft,
Nor it, nor no remembrance what it was.
But flowers distill'd though they with winter meet,
Leavee but their show; their substance still gives sweet."

The origin of perfumery, like that of all ancient arts, has been the subject of great controversy. Some assert it took its birth in Mesopotamia; others in Elam or ancient Persia, others again in Arabia; which has long en-

joyed and still retains the name of the "land of perfumes." It is, however, certain that the first perfumes were obtained by a combustion of aromatic woods and gums (hence the name *per fumum*, "through smoke"); and that the first use primitive nations made of them was to offer them on the altars erected to their gods, joined with the mystic idea that their prayers would rise to them sooner wafted on the blue wreaths of smoke than for the less poetical purpose of counteracting the odour of the flesh burned in their sacrifices. Modern incense derives its sweet balsamic smell from benzoin (*Styracis benzoïn*), which also forms one of the chief ingredients in pastilles and fumigating papers.

The holy incense mentioned in the Exodus as having been prepared by Moses, consisted in equal parts of stacte, onycha, galbanum, and frankincense. Stacte is a kind of myrrh; onycha, a sort of shell found in the Red Sea; galbanum, an aromatic balsam; and habecene, the gum of the *Boswellia thurifera*. I have a table of all the perfumes known and used by the ancient Jews, amongst which you will find the celebrated spikenard, which Sir W. Jones has proved beyond doubt to be the *Valeriana Jatamansi*.

PERFUMES MENTIONED IN HOLY WRIT AS BEING KNOWN AND USED BY THE ANCIENT JEWS.

Aloes (*Alcyonium agallochum*).
Balm of Gilead (*Asyris gileadensis*).
Calamus (*Calamus aromaticus*).
Camphire or Henna (*Lawsonia inermis*).
Cassia (*Laurus cassia*).
Cinnamon (*Cinnamomum verum*).
Frankincense (*Boswellia thurifera*).
Galbanum (*Opodisa galbanifera*, or, perhaps, *Styracis Benzoïn*).
Onycha (a shell) (*Onyx*).
Saffron (*Crocus sativus*).
Spikenard (*Valeriana Jatamansi*).
Stacte or Myrrh (*Balsamodendron myrrha*).

The first mention of perfumes made from flowers is found in Homer, who often speaks of rose oil, *rhodion elai*, which was probably obtained by infusing roses in oil. The Romans likewise used many perfumes, in the shape of oils, pastes, or powders, into which flowers and plants were incorporated.

Distillation is supposed to have been invented by Avicenna, an Arabian physician, who flourished in the 11th century, and who was the first to produce that

Frankincense (*Boswellia thurifera*).

Henna or Camphire (*Lawsonia inermis*), with enlarged leaf and fruit.

the liquid called rose-water. I have here an Arabic manuscript of the 12th century, treating of medicine and pharmacy, which at that time were combined in one, and containing, perhaps, the first illustration of a still, which is then of very rude construction.

Some centuries later, as Noorjehan Begum, the favourite wife of Jehan-Geer, was walking in her garden, through which ran a canal of rose water, she remarked a few icy crystals floating on the surface; they were carefully gathered and found to possess an intense and delightful fragrance. This is given by Lieut.-Col. Polier as the origin of the far-famed otto of roses, which still sells in India for 1 rupee, or £6, per ounce.

Various ottoes or essential oils are now made in India from native fragrant flowers, principally at Ghazepore, on the banks of the Ganges. Besides the rose, they distil several sorts of jasmine, the pandang (*Pandanus odoratissimus*), the champac (*Micheis champaca*), the kurna (*Phœnix mitis*), the bookool or maunai (*Minusops elengi*), and the blossoms of the henna (*Lawsenia inermis*), the leaves of which are largely used by Eastern women for imparting a red tint to their fingers, the palms of their hands, and the soles of their feet. These essential oils are made in very primitive clay stills; the distillate is left to stand overnight in open vessels, and the oil is skimmed off in the morning. They would be very beautiful if they were not spoiled by the admixture of sandal-wood shavings, which

facilitated distillation, but give them all the same heavy flavour.

There are four means in use among modern European perfumers for extracting the aroma from fragrant substances: distillation, maceration, absorption, and expression.

Distillation, which is applied to plants, seeds, barks, woods, and a few flowers, consists, as you all probably know, in placing the substance from which the scent is to be extracted in a copper vessel called a still, with enough water to cover it. Heat is applied, and the steam generated, which, impregnated with the fragrant molecules, passes through the head of the still into the worm, a coiled pipe placed in a tub, where it becomes condensed by means of the surrounding water, which is constantly kept cool, issues in liquid form at the tap, and flows into the recipient. If sufficiently loaded with aroma it then separates into two parts, the most concentrated of which, called the essential oil, collects either on the surface or at the bottom, according to its specific gravity. It is then decanted, and the water used again for distilling, unless it is of sufficient value in itself to be saved, as is the case with rose and orange flower-water. The recipient you see here is called a florentine recipient, from its having been first used at Florence, where flower distilleries still exist. It is constructed in such a way as to allow the water to escape whilst retaining the essential oil.

Steam Still.

A great improvement has been lately effected in distillation, which consists in suspending the fragrant substance on a sieve in the still, and causing a jet of steam to pass through. This operation produces a finer essential oil than by allowing the substances to be steeped in water, as it only carries off the most delicate part of the aroma

without dissolving the bitter principles frequently residing in the basis.

The fragrant principles of all aromatic plants may be extracted by distillation, in the shape of essential oil; in fact, it exists ready formed in many of them, contained in minute vesicles, as you may see by bruising a thyme or rosemary

Oil and Pomade Frames.

leaf. Such is not the case with flowers; the aroma they possess, with a very few exceptions, is so fugitive that it would become destroyed in the process. In that case maceration or absorption is resorted to. Maceration consists in steeping flowers in a bath of hot grease, letting them infuse for some time, and renewing them until the grease is completely saturated. This grease, which is called *pommade*, is then submitted to strong pressure in horsehair bags. Oil is also perfumed in the same way, but requires less heat. This process is applied to rose, violet, cassia, jonquil, and orange flowers, but for more delicate flowers, such as jasmine and tuberose, the absorption, or *enfleurage* system, is employed. Purified grease is spread in a thin layer on a pane of glass mounted in a wooden frame or sash; fresh flowers are strewn over this grease, and renewed every morning; at the end of two or three weeks this grease or *pommade* acquires the scent of the flower in a high degree. Perfumed oil is made in the same way by substituting a wire bottom to the frame, and spreading on it a thick cotton cloth, steeped in the finest olive oil, which is pressed out of it after complete saturation. These frames are piled on each other to keep them well closed.

Monsieur Séméria, of Nice, lately devised an improved sort of frame for the *enfleurage* of jasmine. Instead of laying the flowers on the grease, he places them on a fine net mounted on a separate frame; this net is introduced between two glass frames, covered on each side with grease. The whole series of frames is enclosed in an airtight recess, and all that is required is to draw out the nets every morning, and fill them with fresh flowers, which give their aroma to the two surfaces with which they are in contact. This saves the waste resulting from having to pick out the old flowers.

Mr. Piver, the eminent Parisian perfumer, has likewise invented a very ingenious pneumatic apparatus for making these *pommades*. It consists in a series of perforated plates, supporting flowers placed alternately with sheets of glass overlaid with grease, in a chamber through which a current of air is made to pass several times, until all the scent of the flowers is carried into the grease.

These two processes of maceration and absorption are founded on the affinity which fragrant molecules possess for greasy bodies, becoming fixed into them more readily than into any other. Thus the aroma of flowers is first transferred to these *pommades*, which are made afterwards to yield it to alcohol, whilst the latter, if placed in direct contact with the flowers, would not extract it from them. These alcoholic extracts form the basis of the finest perfumes, as they possess the true scent of the flower in all its freshness and delicacy. The best are made from *pommades*, those made from oil retaining a slightly oily flavour which is not agreeable.

M. Millon, an eminent French chemist, discovered another mode of extracting the aroma of flowers by placing them in a percolating apparatus and pouring over them sulphuret of carbon or ether. The liquid is then placed in a still, the sulphuret of carbon or ether evaporates, and leaves a dry waxy residue, which possesses the aroma of the flower in its most highly concentrated form. This process has not yet received a practical application owing to the expense attending it, as it requires an immense quantity of flowers to make a single ounce of these concrete essences. It is, however, very interesting, as an illustration of the absolute imponderability of perfumes, for although this substance appears at first sight to be the solidified principle of scent, if you treat it several times with alcohol it loses all its fragrance, but not an atom of its weight.

(To be continued.)

TECHNICAL TRAINING OF ARTISANS.

The following account of the Belgian Government Institution for the Technical Instruction of Artisans has been prepared by Mr. Oliver Le Neve Foster, from

documents collected by Mr. T. Twining, in pursuance of the inquiry adverted to in the *Journal* for January 18th, 1865, p. 129:—

The Industrial Schools of Belgium are ten in number—namely—the Industrial School of Bruges, the Industrial School of Gand, the School of Arts and Trades at Tournay, the Training School of Soignies, the Industrial School of Liège, the School for Workmen at Verviers, the School for Industrial Drawing and Weaving at Verviers, and the Industrial Schools of Huy and Seraing. Amongst the Industrial Schools may be included the Higher Institute of Commerce of Antwerp, although it differs from the essentially.

With the exception of the Schools of Gand and Liège, these institutions are of recent date. The State generally has had some share in the expenses of their establishment. Although Government gave some aid every year to the expenses of these schools, yet it did not interfere at all in a direct manner in their management till 1859, and till then left to the communes the nearly exclusive guardianship of the high interests belonging to these establishments. But from that time they were regarded completely by Government.

The instruction is free, except at Antwerp. The only are admitted to the schools who are under a certain age, and who have passed a preliminary examination, showing them to possess a certain general knowledge such as is obtainable in the higher classes of elementary schools; but there are also evening classes for adults which serve, if needed, as preparatory schools.

Each establishment is under the direction of a management committee. Its staff consists of a director, professor, or one or more inspectors named by the common council, and approved by the Minister of the Interior. The committee fixes the hours of the classes, exercises a general supervision over the studies and discipline, and sends an annual report on the state of the school to the Minister of the Interior. The director is usually chosen from amongst the professors; he is entrusted with the superintendence of the studies and the carrying out of the regulations with regard to the teaching and discipline.

THE INDUSTRIAL SCHOOL OF BRUGES (*l'Ecole Industrielle de Bruges*) was founded in 1853; it is annexed to the Academy of the Fine Arts, and is placed under the direction of the parochial Board. Its object is to initiate artisans into that knowledge which in general is indispensable for arts and trades. The instruction comprises elementary mathematics, mechanics, physics, and chemistry in its applications to manufactures and drawing. It is of an elementary and at the same time practical nature, and lasts about three years for the whole course.

The classes are so arranged that the pupils of the schools may follow them in common. The pupils of the Academy receive at the industrial school the theoretical lessons necessary for forming good workmen; at the Academy they receive the instruction in drawing which relates to industrial art.

The government of the school is in the hands of a committee composed of six members, two named by the parochial board, two by the existing deputies of the province, and two by the Minister of the Interior.

THE INDUSTRIAL SCHOOL OF GAND (*l'Ecole Industrielle de Gand*).—Under this name are united in one institution the industrial school and the school for industrial designing and weaving of this town. The first of these establishments was founded previously to 1830, and was governed by a code of regulations, bearing the date of 27th November, 1838. The latter was instituted in 1859.

The new regulations decided on by the parochial board, and approved of by the Minister of the Interior, bearing the date of 26th October, 1860, established the manner in which these two institutions were to be governed.

The classes of the two institutions were united and made to include elementary algebra and geometry, descriptive geometry, plan and ornamental drawing, elements of physics and industrial mechanics, and

technology of textile fabrics, chemistry, and industrial economy.

The classes are conducted both in French and Flemish, and are extended over a period of four years. The classes are public and free, with the exception of those for drawing and weaving. The number is, on an average, 900, who follow one or more courses of lectures in different branches, but principally in industrial mechanics. It is worthy to be noticed that the majority of the professors at this school are former pupils of the classes. This circumstance is perhaps not without its influence on the practical results which this Institution has produced. These results are manifold. Thus, as to the pupils themselves, almost all of whom received their education at the free parochial school, they are now to be seen at the head of almost every industrial workshop, some as the owners, the majority as directors and foremen, and it is only by an exception, which is becoming rarer from day to day, that we meet anywhere a foreign foreman. As to the local industry, the results are not less striking.

THE SCHOOL OF ARTS AND TRADES OF TOURNAI (*École d'Arts et Métiers de Tournai*) was opened in 1841, for the purpose of perfecting the manufactures of the town of Tournai, and for forming good foremen and workmen. Under the old organisation, the pupils paid annually the sum of £10 (250 fr.), for which they were boarded, clothed, received a certain elementary instruction, and were taught a trade.

By the decree of the 1st October, 1860, this establishment has been quite reorganised, and everything has been taken away from the new institution which was contrary to what it was really designed for, namely, to its being an establishment for the technical teaching of the working classes. Thus, the boarding-school has been suppressed, and in order to render the school perfectly industrial in character, public evening classes have been formed, which all workmen and apprentices are allowed to attend gratuitously.

The pupils receive technical instruction in the workshops.

Before the reorganisation took place there were four workshops in the school—the building workshop, the workshop for cap-making, copper-smiths' work, and weaving. The two latter have been discontinued, as they afforded no good results. By way of compensation for this, the workshop for cap-making has been notably developed and raised to perfection. At the same time a stock of tools for the workshops for building machines has been completed.

The theoretical instruction given at the school consists of arithmetic, elementary geometry, physics, chemistry, and mechanics, and mechanical drawing. The budget of the school is as follows.—

A. Receipts.

- 1st. The subsidy of the commune.
- 2nd. The subsidy of the province and the state.
- 3rd. Its produce.

B. Expenses.

- 1st. The salaries.
- 2nd. The money necessary for the keeping in repair and the improvement of the apparatus for teaching, and the expenses of the distribution of the prizes.
- 3rd. The expenses of warming and lighting.
- 4th. Additional expenses.

THE INDUSTRIAL SCHOOL OF LIÈGE (*École Industrielle de Liège*) was first erected by some private individuals during the latter years of the union with Holland. It reserved the character of a private establishment till 1862, when the Commune of Liège, having recognised its utility, admitted it among the communal establishments, and determined to reorganise it, which was accordingly done in 1860.

The instruction comprises elementary mathematics and descriptive geometry in their applications to manufactures, physics, elementary and applied mechanics, chemistry,

drawing (particularly that applied to manufactures), and hygiene. It is given by six professors, one of whom is the director. The classes are held every evening from seven to nine, and are gratuitous. There is likewise a preparatory section, the classes of which are also held in the evening, and a special class for stokers. The duration of the studies is three years. No pupil can be admitted who is less than fourteen years old, and who has not undergone satisfactorily a preliminary examination in reading, writing, grammar, arithmetic, and the elements of drawing. The number of pupils varies from two to three hundred. The new organisation which it has just received will probably add much to the advantages which the manufacturers of Liège derive from this establishment.

The budget of this school is of a similar nature to that of the last.

The remaining industrial schools of Belgium, which I have not noticed, are of a similar character to the above-mentioned ones; the subjects taught there are almost exactly the same, except, that at the school of Soignies the theory of stone-cutting and modelling is taught, and that at the school of Seraing the pupils learn, among other subjects, the working of coal mines.

Amongst the educational establishments for the most improvement of the working classes, perhaps the most important are the apprentice workshops (*les ateliers d'apprentissage*), a good account of which is given by M. de Grave in his "Notice sur les Ateliers d'Apprentissage dans les Flandres."* He states that the principal employment of the working classes in Flanders was weaving by hand, but when machine weaving was introduced into England, a great part of the business of the Flemish weavers was taken away from them.

By a fatal coincidence, too, just at the moment when a trade which had seemed inherent in the soil of Flanders was being taken out of the hands of a quarter of a million of workmen, a potato famine and an epidemic of typhus fever added their horrors to the general distress. In order to furnish a mode of gaining a livelihood to the women spinners who had been thus deprived of all means of subsistence, there were instituted in nearly all the communes of Flanders, by means of pecuniary aid from Government, manufacturing schools, in which women and girls, under the superintendence of skilled mistresses, were taught embroidery, glove-making, sewing, knitting, and especially lace-making of all kinds. But it was not only spinning by hand that thus became lost to Flanders as a branch of industry, but also hand-weaving as then carried on. The weavers had never produced but one kind of work, as they had always been certain of being able to dispose of it advantageously. Their tools had remained the same for ages, and hence they were unable to struggle with success against the more perfect machinery, then introduced into Ireland.

This being the state of the case, it became necessary for Government to take measures for the protection of weaving.

In order to carry out the designs of Government the apprentice workshops were introduced. The organisation and the carrying on of establishments of this class was necessarily economical. The branches of industry exercised there, were placed completely under the management of those masters (*industriels*) who were willing to undertake it. Government reserved itself solely the right of watching over these establishments and seeing the execution of contracts carried out.

The superintendence was exercised by the provincial inspector of workshops, and by a special committee appointed for each workshop, and composed as much as possible of persons of the neighbourhood acquainted with industry. In the contracts relating to these workshops, it was always expressly stipulated that the contractors

* Congrès International de Bienfaisance de Londres. Session de 1862. Tome I.

should give the persons who desired to devote themselves to such work every necessary help, should initiate them into the modes of working, and authorise them to imitate the machines and their products.

The necessary aid for this was furnished by the Government, the province, the communes, and the *bureaux de bienfaisance*.

The aid was not granted to place the contractor in a position to manufacture stuffs at a cheaper rate, but solely to indemnify him in case of those losses which every new enterprise entails.

The public intervention in the expenses of these workshops was, from the beginning, regarded as of a temporary nature. By degrees it was withdrawn, and at present there is not one workshop which receives aid from Government.

Besides these workshops of which we have just spoken, there were erected a considerable number of free apprentice workshops (*ateliers d'apprentissage libres*), that is to say, workshops in which the masters, without being bound by any engagement, furnish the thread, and pay a price agreed upon for the weaving; so that the preference is always given to the master whose conditions are most favourable to the apprentices. The greater part of these institutions are still in existence. They were erected in places where it was judged expedient, not to introduce new manufactures, but solely to make more general the use of a more perfect system of machines, to develop the aptitude of the working classes, and to facilitate the apprenticing of young workmen.

In 1860, an inquiry into the state of these workshops was made, in order to prove the propriety of their being continued or discontinued. After the question had been entered into at length in the Chamber of Deputies, the Minister of the Interior, M. Rogier, made the following statement:—"You have heard the evidence, and I think at present that no one can for a moment dream of the suppression of the apprentice workshops. Everywhere, in about eighty communes, and with but three or four exceptions, they are defended with inconceivable energy. All the communes entreat Government not to take away its benefiting hand, and state the great results which have been obtained by these institutions, for the complete suppression of mendicancy and vagabondage, for the progress of morality and the welfare of the people; all, almost without exception, express this opinion in the most energetic terms, and myself, I avow it, I did not expect such a demonstration; I did not expect such a unanimous adherence; I scarcely believed that the institution of apprentice workshops could have produced such considerable benefits."

The apprentice workshops are established in buildings either constructed for this purpose by the communes or hired.

A machine for hand weaving, of as perfect a nature as possible, is placed there.

The direction is entrusted to an administrative committee, appointed, on the advice of the communal administration, by the governor of the province. Instructors are appointed by the governor of the province, for the purpose of teaching professionally the apprentices. It is necessary for every instructor to be able to read, write, calculate, and teach the apprentices all the practical and theoretical details of the branches of industry exercised in the workshop. The apprentices are instructed in everything that forms part of the art of the weaver.

A salary is granted to the apprentices, varying according to their ability and the stipulated conditions with the masters who furnish the workshop with work.

A deduction of between five and ten per cent. on the salary is made, and the amount of the deductions goes to furnish the apprentice with tools necessary for his trade, when he leaves the workshop. Elementary instruction for two hours a day is given to the apprentices.

Fine Arts.

DISTRIBUTION OF WORKS OF ART IN FRANCE.—In addition to the pictures and statues recently added to the collection of works by living artists in the gallery of the Luxembourg, the Minister of the *Beaux Arts* has just distributed an immense number of works amongst the museums and churches in the various departments of France, as well as in Algeria and the colonies. The number of local museums that have thus acquired additions to their art treasures amounts to more than a hundred, and one or more churches in almost every department have received donations.

STATUE OF TRAJAN.—It is said that a magnificent marble statue of the Emperor Trajan has been discovered during excavations made around the Villa Livia in Rome.

EXHIBITION AT BERGEN.—An artistic exhibition was opened at Bergen, Norway, on the 1st August. All the Norwegian artists have contributed, as well as many German, Danish, and Swedish painters. There are five hundred pictures in the exhibition.

Manufactures.

WORKING MEN'S EXHIBITION AT BIRMINGHAM.—On Monday, the 28th August, there was inaugurated at Bingley Hall, Birmingham, a Working Men's Industrial Exhibition. The catalogue sets forth that there are 17 exhibitors, and the room required is 4,900 feet wall hanging space, 3,820 feet floor space, and 3,830 feet of space. From the moment the project was mooted to artisans disposed to take part in it were warmly seconded by many of the principal manufacturers; to that circumstance no doubt much of the success attained may be attributed. The articles shown are of a very miscellaneous character. The staples of the local industry, of course figure prominently. In stamping there are one or two wonderful specimens; of mechanism a great variety; of iron manufactures, furniture, saddlery, brass-foundry, jewellery, papier-maché, carving and gilding, there is a good display. The Rev. Dr. Miller, as chairman of the Exhibition Committee, presided at the opening, and there were present Lord Leigh, the lord lieutenant of the county, Lord Lyttelton, lord-lieutenant of Worcestershire, Arden dean Sandford, Mr. Newdegate, M.P., Mr. D. Bromley M.P., &c. The inaugural ceremonial was in part dramatic. A prize ode was performed, composed by Mr. Cox's Davies, the prize for it having been awarded by Lord Lyttelton. Thirty-two odes were sent in. The ode was set to music by Mr. Thomas Anderson. It was followed by the National Anthem. Lord Lyttelton then delivered an address, and the mayor declared the Exhibition open.

SCHOOL FOR WATCH MAKING.—Not long since, the French Government established a school at Cluses, in the department of the Haute Savoie, for the training of boys intended for watchmakers, with a view to the improvement of the methods employed in the trade. It was found, however, that the working classes in distant departments could not afford to send their children to school, and pay their expenses there, and, it is said, the Minister of Commerce has instructed the prefect to bring the question before the *Conseils Généraux*, with the view to obtaining subventions in aid from the departments.

AILANTHUS TIMBER.—In the article entitled "Honey Silk Worms," in the *Journal* of the 18th of August, we spoke of the ailanthus, or "Japan varnish tree," spoken of as comparing favourably with that of the oak and elm. M. Raoulx, of Paris, has experimented on the wood during the last twenty-five or thirty years, and declares it to be actually superior either to oak or elm. The following is the average result arrived at by the gentleman after a great many experiments, all made under the same conditions:—

	Ailanthus.	Elm.	Oak.
Density.....	0.713 ...	0.604 ...	0.751
Tenacity.....	32.812 ...	24.867 ...	19.478
Flexibility..	0.083 ...	0.028 ...	0.027

according to this statement, the ailanthus wood is more so than elm though rather less so than oak; its tenacity exceeds that of elm by nearly a quarter, and oak by full three-fifths; and it is nearly one quarter as flexible than oak, and one half more so than elm. These results are surprising when taken in connection with the fact that the tree is of very rapid growth, that ailanthus seems to form an exception to the general rule, that the best timber is always the result of slow growth.

Commerce.

THE FRENCH SOAP TRADE, which is chiefly carried on at Marseilles, suffered considerably in 1864 from the import of pigs' fat, one of the ingredients it employs, having been much less from America than in preceding years, owing to the war, and to the import duty on olive oils from Italy being too high to permit the introduction of this article in the large quantities required, also to the duties on the oils from Genoa, Tunis, and the Levant being so arranged as to check importation. The production of soap consequently has declined, and although the population is constantly increasing, the consumption has been reduced also. In 1864, according to official returns, the amount exported was 480,025 kilogrammes less than in 1863. In the present year the falling off in exports has been greater, whilst the importation has increased.

IRISH BUTTER.—There has been a gradual diminution in the quantity of Irish butter sent to London. In the three years 1842 to 1844 it averaged 311,000 firkins per annum, while in the past three years it has not much exceeded half that quantity, though the number of milch cows in Ireland has nearly doubled. There is an increase in the quantity sent to Liverpool, but if the deliveries in these two ports are added together, it will not show a great increase. The arrivals in 1841 were 639,247 firkins; in 1861 they were 737,895; the increase is 98,648 firkins, worth about £350,000. The number of cattle in Ireland in 1841 was 1,863,116, valued at £12,110,000; in 1861 it had increased to 3,527,309, the estimated value of which is £21,172,508. The increased export of butter is equivalent to about 3½ per cent. on the capital invested, so that it does not leave anything to pay rent for the ground devoted to this purpose, nor for labour.

CHINESE SUGAR.—Much extra ground has been set out at Swatow this year for the cultivation of sugar, in consequence of the demand in the north of China for this product. The Chinese method of pressing sugar is most simple. The cane is passed between two perpendicular iron cylinders—one, being turned by oxen, gives a motion to the others by means of cogs cut in the granite, and shod with hardwood; the juice is thus expelled, and runs through a channel cut for that purpose into a large wooden tub, from which it is removed to the boiler, but closely adjoining. These cylinders are not at all firmly fixed, depending altogether upon their weight to keep them in position. A company of Europeans working a modern sugar mill might make a large profit, if the Chinese would consent to sell their crops when ready cutting. An improved cane mill was imported by an English firm, but the natives refused to purchase or even to use it.

Colonies.

FINANCIAL PROSPECTS OF QUEENSLAND.—It appears from the report of the Auditor-General on the public accounts of the past year that the deficit of £70,673,

which existed at the close of the year 1863, was disposed of by being charged to the loan for immigration. The actual revenue for the year 1864 was £369,426, and the actual expenditure, including some old adjustment of accounts, £440,168, leaving a deficit approximating closely to that of the previous year, viz., £70,743. In addition to this, the revenue of 1865 is liable for the balances of votes already sanctioned by the legislature, but not yet expended, to the extent of £62,630. In land order transactions the aggregate issues for 1864 are stated to be £230,075, which have been satisfied to the extent of £133,031, leaving an outstanding liability on the 1st of January amounting to £97,026. The total liability, therefore, with which the treasurer has to deal in connection with the year 1864 is £230,399. The estimates for 1866 show an estimated revenue of £702,400, and an estimated expenditure of £670,586, the excess of receipts over payments being £31,814. These figures, however, include land order transactions. Considerable difference of opinion seems to prevail with respect to the propriety of reckoning land orders as revenue, a land order being simply an acknowledgment that the holder of it is entitled to a free grant of land. The steamer passenger gets eighteen acres and the cabin passenger thirty acres of land, but neither the one nor the other contribute either £18 or £30 to the revenue. When a selection is made the land order is cancelled, but the land so alienated is not sold, and the nominal value of it has no right to appear in the proceeds of land sales. The colony gains indirectly in exchange for its free grants of land, but it does not appear that the revenue is entitled to take credit for an immigrant's person any more than for his capital, or any other effects he may have brought with him.

THE FIRST QUEENSLAND SOLICITOR.—A Queensland journal records the fact that Mr. W. Fowles has been admitted as an attorney and solicitor to practice in the Supreme Court of Queensland—the first practitioner whose legal education has been entirely derived within the boundaries of that colony.

CINCHONA.—A writer in the *Queensland Guardian* says that the cinchona plant is indigenous in that colony. "It grows plentifully at Gayndah, and very abundantly in the Burnett district. I have seen it on the banks of the Mary river, as well as in the interior of the Wide Bay country. Visitors to Sandgate can either eat the leaves, pluck the berries, or drink the juice of the bark, which they can chip from the trees overhanging the sea. I have seen, and have now in my possession, a very excellent tincture, a homœopathic preparation, prepared by a professional gentleman in this city, which, if I have any occasion to use, I should be willing to try it on illness requiring quinine."

NEW TARIFF IN VICTORIA.—The following is a statement showing the amount of duty collected (under the old tariff) during the months of February, March, and April, 1864, as compared with the collections (under the new tariff) for the same three months of 1865, and with the amount that would have been collected on the same goods under the old tariff:—

	1864. Actual Receipts.	1865. Actual Receipts.	1865, if old tariff had been in force.
Customs	£273,940	£308,314	£302,074
Gold	26,574	17,684	26,526
	£300,514	£325,998	£328,600

TRAITE SOMMAIRE D'ECONOMIE POLITIQUE. By M. J. G. Courcelles Seneuil. (*Guillaumin and Co., Paris.*)—A short popular treatise on political economy, by an author who has made himself a name in France by his larger works on banking, political economy, industry, and social science. The increase in the number of works of this

nature marks a decided change in the habits of thought of the French people, whose attention has of late been greatly given to economical questions, whereas ten or fifteen years ago the great mass of the population had scarcely an idea that political economy was a matter in which any but the governing classes could have an interest. M. Seneuil's work is concise without being meagre, and treats of all the great questions of political economy and its applications, in less than three hundred pages, with that logical simplicity which is one of the happy gifts of French writers. English economists will be interested in the work from the fact that the subject with which they are familiar is treated from another point of view and under circumstances differing in many respects from those which prevail in our own country.

Notes.

INSTRUCTION IN HORTICULTURE has been included in the normal primary school of Chartres since 1840, and forms one of its most important classes. The gardens of the school cover two hectares, or about five acres, of ground, and are appropriated in the following manner:—39 *ares* to arboriculture, 58 to the kitchen garden, 62 to wood, 20 to botany and ornamental gardening, and 20 *ares* for fish ponds. The director is a horticulturist of repute, and his assistants have all been pupils in the school. Professors attached to the model farms belonging to the Government, as at Grignon, and a few amateurs of the neighbourhood, give lectures and hold conversations at intervals. A series of meteorological instruments exist in the establishment, and daily observations are made respecting temperature, moisture, and force of the wind, and are registered with scrupulous attention. The gardens are a source of great interest to the agriculturists and amateurs of the department, and the directors have obtained a large number of medals and other awards, not only at Chartres, but also at Dreux, Châteaudun, Caen, and other places.

MUMMIES IN GUANO.—The Museum at Havre possesses several specimens of animals preserved in the guano of the Chincha islands, but much greater interest has been created by the exhibition of a human mummy found embedded in the same kind of deposit on the coast of Africa, than by all the former acquisitions of that kind in the museum. The body is in a complete state of preservation, and appears to be that of a man of Caucasian race. M. Leunier, the curator of the Museum, has carefully examined the mummies under his charge, and reports that they all exhibit, under the magnifying glass, crystals of ammoniacal salts, to which substances the preservation of the bodies is principally, if not entirely, attributed.

FRENCH COAST TELEGRAPHIC SYSTEM.—Within the last few years the oceanic coasts of France have been brought into communication, by means of the electric telegraph, with the head quarters of the four maritime commands established in that portion of the empire; the stations on the coast are also supplied with semaphores, which enable vessels to communicate by means of signals, so that the Minister of Marine is in fact in direct communication, not only with the coast, but with every vessel within signal range. These semaphores are also open to the public, so that the captain of any vessel, inward or outward bound, may send or receive news direct to or from any part of the country. In order to complete the system, however, it will require eighteen submarine cables to be laid down between the mainland and the islands dotted about the coast, and the laying of these is about to be commenced by the vessel especially devoted to that purpose by the Imperial Government, the *Dix Decembre*, which has returned from laying the Algerian cable. Amongst the coast cables to be laid immediately is that which is to unite the Isle of Ushant with the main land.

SCIENTIFIC CONGRESS AT SPEZIA.—The Italian Society of Natural Science announces that its second extraordinary congress is appointed to take place at Spezia, on the 17th and three following days of September, under the presidency of Professor G. Capellini. The savants of all countries are invited to attend, and those who will take the trouble to write previously to the president will be provided with lodgings by the municipal authorities of the place. The neighbourhood of Spezia is peculiarly interesting to the naturalist, and it is expected that the meeting will be numerous and animated.

EXAMINATIONS FOR 1866.

The Programme of Examinations for 1866 is now published, and may be had gratis, on application to the Secretary. A copy has been forwarded to each Institution and Local Board.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The Committee met on the 12th June. Present—Henry Cole, Esq., C.B., in the Chair; Lord Gerald Fitzgerald, the Right Hon. Sir George Clerk, Bart., Sir John Harington, Bart., Mr. J. P. Boileau, Bart., Colonel Scott, R.E., Captain Donnelly, R.E., Mr. R. K. Bowley and Mr. R. Puttick.

HENRY F. CHORLEY, Esq., examined by the Committee, follows:—

316. You have had considerable experience with the subject of education generally, and musical education in particular?—Some experience.

317.—Have you formed any opinions with regard to musical education in this country?—I have.

318. Should you think it right or expedient to attempt, according to the usual practice in this country, to reform the old institution or to create a new one in the case of the Royal Academy of Music?—I am speaking at a moment's warning, because I have not lately thought the matter over, especially in reference to this committee; but most assuredly I would rather the establishment could be built anew from top to bottom, than that it could be repatched, leaving any part of the present fabric untouched.

319. Instead of a reform you would prefer a revolution regards the Royal Academy of Music?—I should. I have considerable hesitation in expressing my opinions on the subject; as they may give pain to many persons whom I highly esteem and respect as individuals.

320. You consider it would give less pain to individuals to establish the thing anew than to attempt to add those at present connected with it into a better

course if possible?—I do. My own opinion is that it was a mistake on the part of Parliament to accord a grant to the Academy without hearing evidence before a committee. The grant was made in compliance with a petition. We all know that any cause can get any amount of signatures calculated as serviceable. Some sign from intimidation; some from imitation; others in mere thoughtlessness.

321. But this committee finds itself in this position. Here is a Royal Academy of Music, with the Crown at its head, with the patronage of many distinguished personages, though perhaps it does not hold the position in musical eyes which it might: Parliament, in its wisdom, or, as you may think otherwise, has thought it right to endow it with a grant, and the institution exists under the protection of a Royal Charter. Looking at all these circumstances, the committee have to deal with an institution already in existence rather than with any new plan of its own.—Assuredly.

322.—It is also a proper and moot point for consideration whether it would be better to try and improve the existing institution or attempt to establish a new one. We understand your opinion to be in favour of beginning *de novo*?—Certainly, it is so.

323. Have you at all considered the difficulties that would probably attend the formation of a new institution of this kind?—I have considered too many of the evils that have attended the old one.

324. I collect from the paper which you were so good as to read before the Society of Arts, you think that the State ought to recognise a Conservatoire or Musical Academy?—I do.

325. That being so, do you think that Parliament would be likely to give recognition or endowment to two institutions of the kind?—I think if there had been, what I humbly ventured to suggest at the time, such a hearing of evidence as was called for in the case of the question of dramatic monopoly, and has more than once been accorded to the art of Painting, the insufficiency of the Royal Academy would have been proved so strongly that that grant never would have been given.

326. But the grant having been given, the question is if it would be easy to get a second grant for the more perfect institution you contemplate?—in your opinion, would it be safe to attempt that?—You ask me a question that I cannot answer at a moment's warning.

327. Is it not in your opinion possible to renovate the present institution so as to make it tantamount to a new institution?—I think it would be difficult to do so—to the edge of impossibility. Let me repeat that when I have to speak on this subject I feel placed in a delicate

position, as I must give pain to people whom personally I regard very highly.

328. Then we would ask you to give us the benefit of your own theory with regard to what you would consider a better institution?—I must do this by illustration. I think there are radical defects everywhere, mistakes from first to last, in the constitution of the Royal Academy of Music; and I will tell you as well as I can, though disconnectedly, what I think they are. To give one instance, I think it is a vital defect that the presidency of the Academy is so slack, in place of the school being overlooked by a resident superintendent, with no other business than to attend to the concerns of the institution.

329. You do not think it impossible to have a resident superintendent of the Academy?—Assuredly not. It ought to be an established thing that there should be a functionary wholly devoted to such duties.

330. As the principal or head of the establishment?—Perhaps, or merely as a general superintendent; a person to see that the lessons are properly given, and that the whole discipline is properly administered. Then, I think the course of study is a mistaken one. I think it is a mistake that a person who wishes to learn the violin, for instance, should be required to learn other branches of art also. For here is the second clause as stated in the constitution of the Academy:—"All branches of music are taught in the Academy: should the particular branches for which the students enter be harmony, singing, or pianoforte, the male students will be required to learn in addition *any orchestral instrument the committee may require*. I infer from this that a pupil may be required to do a little of everything, and therefore is likely to do nothing good in any special department.

331. You think the system you have described leads to mediocrity?—It has been so proved by the results. Where, to offer a striking example, has any leading female singer come of late from the Academy who is capable of singing Handel's songs so as to take a leading part in oratorios?

332. Admitting the force of your objections, do you think the system irremediable in the Academy?—I think it must be reconstituted entirely.

333. You think it is capable of reform?—Not as the present constitution of the Academy stands.—Then there is a regulation, No. 8, which says, "Advanced students will be required to give instruction in the Academy."—I have a list before me of the professors of the Academy.—There are three in Composition and Harmony of whom the world has never heard anything at all. Here are also six in the singing class that I happen to know have never sung in public at all; some of them are at the present time taking lessons in order to qualify themselves for singing at concerts.

334. And yet they are allowed to teach at the Academy?—There is a strong case I could refer to—the case of a professor in the classes for singing for whom I have the greatest personal and professional regard, and to whom I have sent many private pupils. He has been absent from the Academy the whole winter, and his singing class has been handed over to a deputy. In the pianoforte class I find four or five names whom nobody ever heard of before as pianoforte players; and so throughout the whole list of professors. It would seem that you cannot pay the professors well enough to make them attend to their duties, and hence these are entrusted to incompetent deputies. We see what is the result. An immense disheartening amount of mediocrity. There has not been one commanding English artist, vocal or instrumental, turned out of the Academy during the last twenty-five years; as I, who have to give an account of London music from week to week, feel very vexatiously. For our oratorios, for instance, we must have resort to Meslames Parepa and Sherrington.

335. They are English ladies are they not?—But not educated in this country. Madame Sherrington was

educated in the Conservatoire of Brussels. The and best English singer from the Academy who made any high reputation is Madame Sainton. We have had no other female singers, that I know who are capable of taking a leading part in English music. Our great English soprano, Madame Sims Reeves, Mr. Sims Reeves, Mr. Sims and Mr. Weiss were trained elsewhere.

336. You attribute much of this shortcoming to the constitution of the Academy; will you form a committee with your views of what the constitution should be?—That is like asking me to frame a constitution of my own; this I am not arrogant enough to do so short a notice. I think in the first place the principal ought not to be connected with the business.

338. With submission, that hardly refers to the constitution?—I think it does, since it is not providing. I doubt whether any Committee made up of amateurs and professional men can ever arrive at anything near to what is good, because on the one hand there are all manner of private interests and influences on the other side all manner of old traditions.

339. You think there should not be a mixture of amateurs and professionals on the committee?—The more the committee the better.—I think the *Concerts Paris* was brought to its present state by the Government, under the Empire, of Cherubini as its sole power.

340. You think the appointment of a despot is preferable to the existing constitution of the Royal Academy of Music?—I do.

341. Do you think there should be a committee of management at all?—Yes, for details, but not for perpetual interference.

342. Does your notion of a superintendent go vesting him with powers over the professors?—No. I think my notion would be that there should be a number of professors appointed; and that once appointed they should not be at liberty to perform their duties as deputy; and that it should be the business of the superintendent to see this regulation not broken.

343. Would you put into the hands of the superintendent what is called the lay management of the Academy looking after the expenditure, the cleaning, the moral conduct of the students?—I should think the superintendent ought to undertake those duties.

344. Would you have the superintendent appoint the professors?—No; by the people who find the money for the support of the institution.

345. Supposing the public do, as at present, find the money, do you not think they would require to be satisfied in some way in the expenditure of it?—If a good result was shown after the second or third year the public would not demur or interfere so as to send an Inquiry from time to time there will always, and be. The best answer to this is result.

346. We may collect, from the opinions you have pressed, that you think the institution ought to be supported by the State. Do you think the State should be the whole paymaster, or would you have contributions from the public besides?—I think the whole matter should be presented to the State on some such representation. You have to look at the fact of the number of persons who go abroad for their musical education. A young person (for instance) cannot go to a foreign Conservatoire out her mother or some relative accompanies her, and would be rendered unnecessary, were our home institution in the least satisfactory. I think the institution ought to be in part self-supporting.

347. By the fees of the students?—In part by the fees of the students; but based on such a public grant as to secure such good teachers in the Academy as to make it impossible for their duties to be performed by others without making the fees too onerous.

348. And pay them adequately?—Assuredly.

49. Who is to pay them?—I have mentioned a Government grant. There is one now.

50. Would you have the Government undertake the sole pecuniary responsibility?—No; nor do I believe could undertake it.

51. You would wish the responsibility of the management to be undertaken by the House of Commons?—So as the Government grant goes, yes. It might, I think, proceed on report.

52. You think that would be more effectual than the present system?—I think there is no very great public leisure with regard to the present President of the Royal Academy of Arts. There should be a person in a similar position with regard to the Royal Academy of Music. I feel that by dividing and sub-dividing, and mixing amateurs and professionals too largely mixed up together, both time, money, and progress are frittered away.

53. Is it your opinion that the first grant of £5000 received with such acclamation by the House as to you to think it could easily be increased to £5,000? I know nothing about that.

54. Does it not seem to you the first point should be first catch the hare"—i.e. the money? If you could the State to pay the whole expense your theory might be very satisfactory?—I do not see that anything in England wants support that is thoroughly well done. Getting away what would be fortune and opulence to set up a worthy institution on waste, experiments, and taste favouritism. I am indisposed to go on patching the old thing year after year.

55. The committee would be very glad to receive your views for the remodelling of the Academy?—I have said I am not prepared with it at this moment.

56. You would have no objection, after reflection, to submit the committee with it in writing?—Perhaps not, I have time. It will require time.

57. You attribute part of the failure of the Academy to the results to defects in the constitution. Do you attribute any portion of the failure to incompetency on the part of the professors; to the mode of teaching, or to the want of ability on the part of those who are taught?—I think that one cardinal fault in the constitution is that which allows the professors to evade their duty. There is no doubt that the principal professors are in general well qualified; but it appears they are so inadequately paid that they are tempted to wander away and allow persons who are not making lessons to teach their pupils; and I would not wonder if any professor to absent himself from the Academy without formal permission on sufficient grounds.

58. If they are not sufficiently paid must they not necessarily go away from the Academy?—It comes to the same, no doubt.

59. How would you get the money to pay them adequately, and prevent their leaving?—I repeat myself, that if you had a really sound institution to begin with you would have no difficulty in getting the money from sources partly public and partly private.

60. With such an institution as you would sketch, I am sure, do you think the money might be obtained without any difficulty?—I do not believe the want of money would be any difficulty, because I see perpetually in my course with the musical and amateur world, and I have seen, how magnificently students going abroad to receive their musical education, because they cannot obtain it here, have been assisted. We ought to have the best musical education in the world. With all the variety of professors of the first class resident here, we ought to have a thoroughly good and cheap musical education in this country.

61. The committee would be glad to receive your views of a system which should obviate the necessity of the student going abroad to get their musical education; and you would be glad to know if that could best be done by uniting that which was good abroad with that which is here. Assuming that by some mode or other sufficient funds are obtainable to give a good musical education in this country, I would proceed to ask you in detail upon some of the points in your paper before the Society of Arts. I gather that you would like to have the endowment for scholarships?—I do not see why this should not be. If pupils have turned out well, I do not see why they should not have the benefit of travelling for a couple of years. A composer or violinist might go to Germany, a singer might go to France or Italy.

362. Are you in favour of students paying fees?—Assuredly.

363. Probably graduated fees?—That would be best, I think.

364. And students of rare ability paying no fees at all?—Surely so, when justified by examination and circumstance.

365. Going a step farther than that—supporting them also?—I don't know. That is a delicate question.

366. If a benevolent musical man thought proper to bequeath £1000 to the Academy to endow a scholarship, you would see no objection to the institution accepting it?—Certainly not. On the contrary, that is the basis on which many institutions have been raised and extended.

367. Are you aware that at Leipzig the endowments are small, and that the chief support of the academy there is derived from the fees of the students?—And why should it be that English students should have to go to Leipzig for what they cannot get so well at home?

368. You would wish to see a good library in connection with the Royal Academy?—I would. To return for a moment: we were discussing the other day what should be done with a new Mendelssohn scholar, and it was decided that he should be sent to Leipzig. In our Royal Academy of Music there is no professor of the German language, nor of French, and people who have to prepare themselves to sing in these languages must go either to France or Germany. I would have such an education in a central academy of the leading metropolis of the world, as to enable the pupils to sing in the foreign languages most required in music, especially Italian. I think the pupils ought to have access to professors who could teach them properly to pronounce in the three languages in which they would have to sing, and not least of all in their own. I could name compositions by professors at present attached to the Academy, which make it obvious that they comprehend neither the poetry nor the prosody of their own language. I would have no such person sing, or teach singing, or instruct in composition.

369. The reforms or improvements at which you glance would, of course, entail a largely-increased expenditure?—If there was a good grant to a really good thing I don't believe it would be grudged by the public.

370. What would you call a good grant?—You ask me to reconstitute the Academy, and state what the professors should have for certain duties.

371. Supposing you, as a person devoted to music, went to Parliament, you would go with a definite demand?—I cannot answer you at the moment.

372. Perhaps you will give us your ideas on the subject hereafter?—I may say I think there ought to be something like £10,000 a-year voted by Parliament for music, considering the place and progress of that art in this country; and I think for that sum it could be done most completely and perfectly.

373. Would you make the payment of the whole or part of that sum conditional on the work done, or would you pay the whole sum in faith?—I would pay it in faith, perhaps. When we see how much painting, including design, has received in aid, if one art is aided by money the other ought to be aided also.

374. For how long a time would you say should the money be paid in faith?—That I cannot say; I am not ready with a working plan.

375. What should you consider would be a fair period for the experiment, three, five, or ten years?—I would

rather have the money paid a couple of years beforehand, so as to get the new Academy well organised and arranged, and not started as a scheme rushed into in a hurry.

376. Supposing you failed in making Parliament as enthusiastic as yourself on this subject, would you abandon all efforts to improve the existing institution?—I have a great notion that what was said during the discussion upon my paper here is true, that it is no use to mend an old coat.

377. Assuming a new coat is to be made, one question is, if you would call upon Parliament to be the only tailor?—No; I presume the students would put the buttons on, and the public help at the lining.

378. Would you put the entire responsibility of the expenditure upon Parliament?—I have said not; but I would have Parliament grant a liberal vote.

379. Do you assume, with the present grant of £500, and with a less grant than £10,000, all efforts to improve the present Academy should be abandoned?—I see no chance of improvement without demolition. I think if there is to be a government establishment for the advancement of a great art, it ought not to be done in a peddling twopenny-halfpenny way. I know that many private individuals are ready and anxious to give their aid, without personal interest or desire for notoriety. Meanwhile I am frequently asked, with regard to persons who have good voices and good musical talents, "Where shall we send them?" Certainly not to the Royal Academy. I would rather bide my time and send them abroad, than say a word to aid in patching up the old system.

380. Taking the condition of the Royal Academy of Music to be at present at zero, do you consider it to be quite incapable of resuscitation under its present constitution?—I repeat it would be a very difficult thing to do—vying on impossibility.

381. You think, with an income of £10,000 a year, such an institution as you would approve of must be efficiently supported?—Yes, certainly.

382. In the event of Parliament refusing such a grant as you would consider proper, would you still supplement the resources of the Academy by public subscriptions and the fees of the students?—Certainly; I do not think it would be a good thing to make an establishment of pauper scholars.

383. You would supplement the present or any moderately increased government grant by the subscriptions of the public?—Certainly.

384. We gather that your objections to the present constitution of the Academy are, first, the want of a resident superintendent? In your opinion, should the superintendent necessarily be a professional musical man, or merely a person of good general and business qualifications?—He should be a person who had nothing else to do but to superintend the proceedings of the Academy.

385. Should he necessarily be a member of the musical profession?—That is a question I am not prepared to answer.

386. You think it is not strictly essential?—Not necessarily so, but he should be a person whose interest and desire it would be that the whole duties of the Academy were regularly and properly performed.

387. Are you aware that up to a recent period there has been a resident superintendent of the Academy fulfilling the duties you have indicated?—Yes.

388. Then in theory the system was right, though practically it did not work well?—I think the person at the head of such an establishment should be a shrewd, clever man. The theory can hardly be put in practice under the existing constitution.

389.—Your next objection to the present system we understand to be that the students are required to learn other branches of music than that to which they wish specially to devote themselves?—They are required to do too much.

390.—Do you think it a disadvantage to a singer that he should be able to play the pianoforte?—Oh, no.

391. Or that he should understand the principles of harmony?—Certainly not. But if a pupil enters for the violin, I do not see the advantage of his being compelled to learn the pianoforte or the bassoon to take out the orchestra.

(Sir George Clerk: He is not obliged to learn the pianoforte; the converse is the case.)

Mr. Chorley: He must learn whatever orchestral instrument is wanted to fill up the band. Quota Regulation No. 2.)

392. Do you think it a disadvantage to a singer to be able to accompany himself on the pianoforte?—I have said certainly not; but I do not think it should be made obligatory upon the students beyond a limited point. Some of the best singers in the world are not able to play at all. Pasta was a great singer, yet I never heard of her accompanying herself.

393. The next point you mentioned was, that students are required, if capable, to give instruction?—I have an objection to instruction by deputy, and by pupil teachers entirely, for this reason, that for every pupil the best and most experienced masters are wanted.

394. Are you aware that the pupil-teachers only give instruction in what is called the second branch of study?—I think that should be the work of the professors.

395. Have you examined the whole system of the Academy in detail?—Yes; by having closely watched and tested the results; and I would not allow myself belonging to me to remain there a month if I were not under the principal professors.

396. Were you ever inside the Academy?—A great deal in former years.

397. Not lately?—No.

398. Are you aware whether any changes and improvements have taken place since you were there?—I see no proof of the latter. I have been at three or four of the concerts, and they are less satisfactory than they were twenty-five years ago. And this brings me to another point: I cannot think that the pupils of the Academy should be allowed to tire their voices by singing elsewhere.

399. You think they prematurely bring themselves forward?—Certainly; since I perceive they are allowed to perform at concerts elsewhere. My notion of carrying on the Academy would be that the pupils should not be allowed to take engagements on their own behalf, but about performing till they were accredited as professionals. While I would make the professors more easily accessible, I would make the students' discipline more stringent.

400. With the £10,000 you think the practical discipline of the Academy could be made as strict and as efficient as you could desire?—I think if the suggested principle were worked out you would arrive at something near it; but, so far as I can understand, there is no discipline at all, and every pupil can get permission to go where he likes.

401. Are you aware, with regard to the instruction of pupils, that a great number of them are employed in opera and Philharmonic orchestras?—No doubt. I cannot remember one great instrumental player whom the Academy has turned out during the last 25 years should like to know one.

402. Are there any other objections beyond those we have stated to the system in the Royal Academy?—I think the first thing is the want of a resident superintendent; the second, the teaching by deputy; the third, allowing the pupils to take engagements before they are students and before their education is finished.

403. In whom would you rest the appointment of a superintendent? With the duties you would assign would be a position of great responsibility.—A very and a very difficult one.

404. But there must be a governing body of the Academy of some sort. What in your opinion should be the nature of the governing body? Should the government be in one person or in a committee?—A small committee consisting of as few members as possible.

405. About the same number as there are trustees of the National Gallery?—Something of that kind, perhaps; as limited as possible.

406. Would you consider it beyond human power to obtain a new charter for the Academy?—There is no doubt what human power could do.

407. You would not object to the title of "Royal Academy of Music"?—Surely not.

408. Is it your opinion that there should be a head and responsible professor in each department? Do you think, for instance, there should be a head singing-master?—I think that the professors should be responsible for their pupils till their education is finished; and that when the pupils go to receive their lessons they ought always to find the professors who undertake to teach them there, and that no change from caprice should be allowed on one side or the other.—I think the pupils should not be allowed to evade lessons by taking engagements elsewhere.—I think there should be perfect order and system in the instruction, and the lessons should be given with the greatest regularity; and there should be a person in general authority resident in the Academy to whom appeal could be made both by professors and students.

I cannot permit this revised report of my evidence to go out to the public without respectfully stating that I met the committee without the slightest idea of being put under examination, and that while I have not altered or modified a single opinion which I felt it my duty to offer, on the spur of the moment—merely confining myself to the correction and removal of verbiage, and to an addition or two made for the sake of distinctness—I feel the incompleteness of my testimony on many points which I consider of importance.

HENRY F. CHORLEY.

Full opportunity will be afforded to Mr. Chorley to complete his testimony.

P. LE NEVE FOSTER.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

BIRMINGHAM, 1865.

The thirty-fifth meeting of the British Association commenced on Wednesday, the 6th instant, under the presidency of John Phillips, M.A., F.R.S., Professor of Geology in the University of Oxford.

A meeting of the General Committee was held at one o'clock, Sir Charles Lyell (the retiring President) in the chair. The financial report showed that the receipts of the Association for the past year were £3,831, and that there was an available balance of £759 in the treasurer's hands. A long discussion took place on a motion made by Dr. Hunt, and seconded by Sir Edward Belcher, to the effect that a separate section be formed, to be devoted to the Science of Anthropology. The motion was ultimately negatived.

At the general meeting in the evening the President delivered the opening address, of which the following are some of the most interesting portions:—

"Assembled for the third time in this busy centre of industrious England, amid the roar of engines and the clang of hammers, where the strongest powers of nature are trained to work in the fairy chains of art, how softly falls upon the ear the accent of science, the friend of that art and the guide of that industry! Here, where Priestley analysed the air, and Watt obtained the mastery over steam, it well becomes the students of nature to gather

round the standard which they carried so far into the fields of knowledge. And when, on other occasions, we meet in quiet colleges and academic halls, how gladly welcome is the union of fresh discoveries and new inventions with the solid and venerable truths which are there treasured and taught. Long may such unions last—the fair alliance of cultivated thought and practical skill—for by it labour is dignified and science fertilized, and the condition of human society exalted!

"Through this happy union of science and art, the young life of the British Association—one-third of a century—has been illustrated by discoveries and enriched by useful inventions in a degree never surpassed. How else could we have gained that knowledge of the laws of nature which has added to the working strength of a thousand millions of men the mightier power of steam, extracted from the buried ruins of primeval forests their treasured elements of heat and light and colour, and brought under the control of the human finger, and converted into a messenger of man's gentlest thoughts the dangerous mystery of the lightning."

The President discussed the question of the velocity of light, and explained why "the distance of the earth from the sun must be reduced from above ninety-five to less than ninety-three millions of miles, and by this scale the other space-measures of the solar system, excepting the diameter of the earth and the distance and diameter of the moon, would be corrected."

* * * * *

"Spectral analysis, that new and powerful instrument of chemical research for which we are indebted to Kirchhoff, has been taught by our countrymen to scrutinise not only planets and stars, but even to reveal the constitution of the nebulae, those mysterious masses out of which it has been thought new suns and planets might be evolved. The latest results of spectral analysis of stars and nebulae by Mr. Huggins and Professor W. A. Miller, show that the nebulae are indeed found to have in some instances stellar points, but they are not stars; the whole resembles an enormous mass of luminous gas, with an interrupted spectrum of three lines, probably agreeing with nitrogen, hydrogen, and a substance at present unknown. Stars tested by the same accurate hands are found to have a constitution like that of our own sun, and, like it, to show the presence of several terrestrial elements—as sodium, magnesium, iron, and very often hydrogen.

"To aid researches into the condition of celestial bodies, the new powers of light, discovered by Niepce, Daguerre, and Talbot have been employed by Bond, Draper, De la Rue, and other astronomers. To our countryman, in particular, belongs the honour of successful experiments on the rose-coloured flames which extend from certain points of the sun's border during an eclipse; as well as of valuable contributions through the same agency to that enlarged survey of the physical aspect of the moon, which, since 1852, the Association has striven to promote."

* * * * *

"As we ascend above the earth, heat, moisture, and magnetic force decrease, the velocity of wind augments, and the proportion of oxygen and nitrogen remains the same. The decrease of heat as we rise into the air is no new subject of inquiry, nor have the views respecting it been very limited or very accordant. Leslie considered it mathematically in relation to pressure; Humboldt gave the result of a large inquiry at points on the earth's surface, unequally elevated above the sea; and finally, Mr. Glaisher and Mr. Coxwell, during many balloon ascents to the zones of life-destroying cold, far above our mountain tops, have obtained innumerable data, in all seasons of the year, through a vast range of vertical height. The result is to show much more rapid decrease near the earth, much slower decrease at greater elevations. The proportion of carbonic acid gas in the atmosphere at great heights is not yet ascertained."

* * * * *

"Researches of every kind have so enriched meteorology since our early friend, Professor J. Forbes, printed his suggestive reports on that subject; and so great have been the benefits conferred on it by the electric telegraph, that at this moment in M. Leverrier's observatory at Paris, and the office so lately presided over by Admiral Fitzroy in London, the messages are arriving from all parts of Europe to declare the present weather, and furnish grounds for reasonable expectation of the next probable change. The gentle spirit which employed this knowledge in the cause of humanity has passed away, leaving an example of unselfish devotion in a work which must not fail through any lack of energy on the part of this Association, the Royal Society, or the Government."

Having touched on various other subjects, the President passed on to the consideration of the present state of geological science. On the question of the antiquity of organic life on the earth, he said:—

"Was the earth ever uninhabited, after it became a globe turning on its axis and revolving round the sun? Was there ever a period since land and sea were separated—a period which we can trace—when the land was not shaded by plants, the ocean not alive with animals? The answer, as it comes to us from the latest observation, declares that in the lowest deposits of the most ancient seas in the stratified crust of the globe, the monuments of life remain. They extend to the earliest sediments of water, now in part so changed as to appear like the products of fire. What life? Only the simpler and less specially organised fabrics have as yet rewarded research among these old Laurentian rocks—only the aggregated structures of Foraminifera have been found in what, for the present at least, must be accepted as the first deposits of the oldest sea.

"Then step by step we are guided through the old Cambrian and Silurian systems, rich in Trilobites and Brachiopoda, the delights of Salter and Davidson; with Agassiz and Miller and Egerton we read the history of the strange old fishes of the Devonian rocks; Brongniart, and Goppert, and Dawson, and Binney, and Hooker unveil the mystery of the mighty forests now converted to coal; Mantell and Owen and Huxley restore for us the giant reptiles of the Lias, the Coliite, and the Wealden; Edwards and Wright almost revive the beauteous corals and echinodermata; which with all the preceding tribes have come and gone before the dawn of the later periods, when fragments of mammoths and hippopotami were buried in caves and river sediments to reward the researches of Cuvier and Buckland, Prestwich and Christy, Lartet and Falconer.

"And what is the latest term in this long series of successive existence? Surely the monuments of ever-advancing art—the temples whose origin is in caverns of the rocks; the cities which have taken the place of holes in the ground, or heaps of stones and timber in a lake; the ships which have outgrown the canoes, as *that* was modelled from the floating trunk of a tree, are sufficient proof of the late arrival of man upon the earth, after it had undergone many changes and had become adapted to his physical, intellectual, and moral nature. Compared with the periods which elapsed in the accomplishment of these changes, how short is the date of those yet standing monoliths, cromlechs, and circles of unhewn stone which are the oldest of human structures raised in Western Europe, or of those more regular fabrics which attest the early importance of the monarchs and people of Egypt, Assyria, and some parts of America! Yet tried by monuments of natural events which happened within the age of man, the human family is old enough in Western Europe to have been sheltered by caverns in the rocks, while herds of reindeer roamed in Southern France, and bears and hyenas were denizens of the South of England. More than this, remains of the rudest human art ever seen are certainly found buried with and are thought to belong to races who lived contemporaneously with the mammoth

and rhinoceros, and experienced the cold of a Gallic or British winter, from which the woolly covering of the wild animals was a fitting protection."

"Various questions of romantic interest in the study of the distribution and languages of the family of man are part of a large circle of the inquiry which finds sympathy in several of our sections, especially those devoted to Zoology, Physiology, and Ethnology. Let us not expect or desire for them a very quick, or, at present, a very definite settlement. Deep shadows have gathered over the earlier ages of mankind, which perhaps still have periods of time may not avail to remove."

After further enlarging on the question of the antiquity of man, the President passed to the consideration of the analogy existing among all parts of the animal kingdom, and in a general sense among all the forms of life, which had become more and more the subject of special study.

"Whether what we call species are so many original creations or derivations from a few types or one type, as discussed at length in the elegant treatise of Darwin himself a naturalist of eminent rank. It had been often discussed before. Nor will any one think lightly of the inquiries, who remembers the essay of Linnaeus, *Telluris orbis incremento*, or the investigations of Owen, Pritchard, Forbes, Agassiz, and Hooker regarding the local origin of various species, genera, and families of plants and animals, both on the land and in the sea. Still less will he be disposed to undervalue its importance when he reflects on the many successive races of the forms more or less resembling our existing quadrupeds, reptiles, fishes, and mollusca, which appear to have occupied definite and different parts of the depth of ancient time. Is the living elephant of Ceylon a lineal descendant of that mammoth which roamed in Siberia and Europe, and North America, or of those sub-Himalayan tribes which Dr. Falconer has made known, or was it a species dwelling only in the polar regions? Can our domestic cattle, horses, and dogs, our beasts of chase and our beasts of prey, be traced back to their source in older types, contemporaries of the megaceros, and hyenas on the plains of Europe? If so, what range of variation in structure does it indicate? not so, by what characters are the living races separated from those of earlier date?

"Specific questions of this kind must be answered before the general proposition, that the forms of life are indefinitely variable with time and circumstance, can be even examined by the light of adequate evidence. The such evidence will be gathered and rightly interpreted for one neither doubt nor fear.

"How important, in the view of this and many other questions, is that never-tiring spirit of geographical and maritime discovery, to which through four hundred years Europe has sent her noblest sons and her most famous expeditions; sent them, alas! too often to an early grave. Alas! for Franklin, who carried the magnetic flag to the icy sea from which he had already brought trophies to science! Alas! for Speke, who came home with honour from the head waters of the Nile! Forgotten they can never be, whenever on occasions like this we mourn the absence of our bravest and our best; praiseworthy praise be theirs, while men retain the generous impulse which prompts them to enterprises worthy of their country and beneficial to mankind.

"Waves—their origin, the mechanism of their motion, their velocity, their elevation, the resistance they offer to vessels of given form, these subjects have been first kept in view by the Association, since first Professor Challis reported on the mathematical problems they present, and Sir J. Robinson and Mr. Scott Russell met to study them experimentally. Out of this inquiry be-

come a better knowledge of the forms which ought to be given to the 'lines' of ships, followed by swifter passages across the sea, both by sailing vessels and steamers, of larger size and greater lengths than were ever tried before."

After referring to the labours of the British Association in various other directions, particularly in the promotion of meteorological science, the President went on to say:—

"When we enter the domain of practical art, and apply scientific methods to test a great process of manufacture, we do not fail of success; because we are able to join in united exertion the laborious cultivators of science and the scientific employers of labour."

"Am I asked to give an example? Let it be iron, the one substance by the possession of which, by the true knowledge and right use of which, more than by any other thing, our national greatness is supported. What are the ores of iron—what the peculiarities and improvements of the smelting processes—what the quality of the iron—its chemical composition—its strength in columns and girders as cast-iron; in rails and boiler plate, in tubes, and chains, as wrought iron—what are the best forms in which to employ it, the best methods of preserving it from decay;—these and many other questions are answered by special reports in our volumes, bearing the names of Barlow, Mallet, Porter, Fairbairn, Bunsen, Playfair, Percy, Budd, Hodgkinson, Thomson; and very numerous other communications from Lucas, Fairbairn, Cooper, Nicholson, Price, Crane, Hartley, Davy, Mushet, Hawkes, Penny, Scoresby, Dawes, Calvert, Clark, Cox, Hodgkinson, May, Schafhaeuti, Johnston, Clay, and Bouigny. Beyond a question, a reader of such of these valuable documents as relate to the strength of iron, in its various forms, would be far better informed of the right course to be followed in experiments on armoured ships and forts to resist assault, and in the construction of ordnance to attack them, than he is likely to be from merely witnessing a thousand trials of the cannon against the target. Anyone who remembers what the iron furnace was forty years ago, and knows its present power of work; or who contrasts the rolling mills and hammers of other days with the beautiful machines, which now, with the gentlest motion but irresistible force, compel the strong metal to take up the most delicately moulded form; will acknowledge, that within the period since the British Association began to set itself to the task of reconciling the separated powers of Theory and Experience, there has been a total change in the aspect of each, to the great advantage of both."

The President concluded as follows:—

"Such, gentlemen, are some of the thoughts which fill the minds of those who, like our Brewster, and Harcourt, and Forbes, and Murchison, and Daubeny, stood, anxious but hopeful, by the cradle of this British Association; and who now meet to judge of its strength and measure its progress. When, more than thirty years ago, this Parliament of Science came into being, its first child-language was employed to ask questions of Nature; now, in riper years, it founds on the answers received further and more definite inquiries directed to the same prolific source of useful knowledge. Of researches in science completed, in progress, or in beginning, each of our annual volumes contains some three hundred or more passing notices, or full and permanent records. This digest and monument of our labours is indeed in some respects incomplete, since it does not always contain the narrative or the result of undertakings which we started, or fostered, or sustained; and I own to having experienced on this account once or twice a feeling of regret. But the regret was soon lost in the gratification of knowing that other and equally beneficial channels of publication had been found, and that by these examples it was proved how truly the association kept to the real purpose of its foundation, 'the advancement of science,' and how heartily it rejoiced in this advancement without looking too closely to its own share

in the triumph. Here, indeed, is the stronghold of the British Association. Wherever and by whatever means sound learning and useful knowledge are advanced, there to us are friends. Whoever is privileged to step beyond his fellows on the road of scientific discovery, will receive our applause, and, if need be, our help. Welcoming and joining in the labour of all, we shall keep our place among those who clear the roads and remove the obstacles from the paths of science; and whatever be our own success in the rich fields which lie before us, however little we may now know, we shall prove that in this our day we knew at least the value of knowledge, and joined hearts and hands in the endeavour to promote it."

ON THE COMMERCIAL USE OF FLOWERS.

By EUGENE RIMMEL.

(Author of the "Book of Perfumes," &c.)

(Continued from page 646.)

The number of flowers used for perfumery purposes has hitherto been limited to seven, viz., rose, jasmijn, orange, violet, jonquill, tuberose, and casia. The rose used is the hundred-leaved rose (*Rosa centifolia*), the jasmijn is the *Jasminum grandiflorum*, the orange is the bitter orange (*Citrus bigaradia*), and the violet the *Viola odorata*, or double parma violet.

Tuberose (*Polyanthes tuberosa*).

Tuberose (*Polyanthes tuberosa*) and jonquill (*Narcissus jonquilla*) are two bulbous plants, and the casia (*Acacia farnesiana*) a pretty shrub with globular golden flowers, which thrives admirably in the south of France.

Casia (*Acacia farnesiana*).

Out of those flowers four only are distilled and yield essential oils, viz., rose, orange, jasmijn, and casia. Rose gives the far-famed otto, which is principally made in Turkey, near Adrianople. Orange flowers produce what is called neroli, a name derived from *nero olio*, dark oil, and not, as some people have imagined, from its having been discovered in the time of Nero. For the Romans were totally ignorant of the art of distillation. Jasmijn and casia are only distilled, to my knowledge, in Northern Africa (Algeria and Tunis) and in India. European flowers not possessing a sufficiently intense fragrance.

The aroma of the other flowers is extracted by means

of absorption or maceration. Several other flowers besides those named are sometimes submitted to these processes, such as mignonette, lilac, hawthorn, wall-flower, lily, heliotrope, sweet-pea, &c., but the quantities obtained are so small that they have hitherto been mere experiments, and we are still obliged to compound all these perfumes artificially by studying resemblances and affinities, and blending the shades of scent as a painter does the colours on his palette. Thus, for instance, we imitate heliotrope with the aid of vanilla, sweet-pea by a mixture of rose and orange flowers, magnolia with tuberose, orange flower, and a dash of lemon, &c.

Flowers for perfumery purposes are principally grown in the neighbourhood of Grasse, Cannes, and Nice, three towns situated in the South of France, close to each other. The manufacture of perfumery materials forms one of the principal branches of industry in that district, giving employment to upwards of ten thousand people, including many women and children, for whom the work of culling flowers and picking off the stalks is particularly suitable. These flowers are generally grown by small farmers, who contract with the perfumers for their crop, with the exception of orange flowers, which are always sold on the market. The prices flowers realize vary a good deal, according to the abundance of the crop. They average as follows:—

	s.	d.		s.	d.	per lb.
Rosesfrom	0	4	to	0	8	"
Orange flowers .. "	0	6	"	0	10	"
Jasmines..... "	1	0	"	1	6	"
Violets	1	6	"	2	6	"
Tuberose	1	8	"	2	0	"
Cassie..... "	2	0	"	3	0	"
Jonquils	1	0	"	1	6	"

The following are approximate quantities and values of the flowers consumed for perfumery purposes in that locality alone:—

	lbs.	worth about	£
Orange flowers .	2,000,000		50,000
Roses	600,000	"	15,000
Jasmines.....	150,000	"	8,000
Violets	60,000	"	6,000
Cassie.....	80,000	"	6,000
Tuberose	40,000	"	3,000

The principal plants from which essential oils are made are lavender (*Lavandula vera*), spike (*Lavandula spica*), peppermint (*Mentha piperita*), rosemary (*Rosmarinus officinalis*), thyme (*Thymus vulgaris*), wild thyme (*Thymus serpyllum*), and marjoram (*Origanum majorana*), which all grow wild in the neighbouring mountains, and are distilled on the spot by means of portable stills. An essential oil is also extracted from geranium (*Pelargonium odoratissimum*), which, from its strong rosy flavour is much prized by perfumers, and the bitter orange leaves yield a powerful essence named *Petit-grain*, which is used in eau de Cologne. The following table gives the average quantities of flowers and plants required to make 1lb. of essential oil.

QUANTITIES OF FLOWERS, &c., REQUIRED TO MAKE ONE POUND OF ESSENTIAL OIL.

	lbs.
Roses (<i>Rosa centifolia</i>)	10,000
Orange flowers (<i>Citrus bigaradia</i>) ...	1,000
Orange leaves	500
Geranium (<i>Pelargonium odoratissimum</i>)	500
Lavender (<i>Lavandula vera</i>)	120
Spike (<i>Lavandula spica</i>)	80
Thyme (<i>Thymus vulgaris</i>)	200
Wild thyme (<i>Thymus serpyllum</i>)	200
Rosemary (<i>Rosmarinus officinalis</i>)	100

It has been proposed to cultivate flowers in England for perfumery purposes, but the climate renders this scheme totally impracticable. English flowers, however beautiful in form and colour they may be, do not possess the intensity of odour required for extraction, and the

greater part of those used in France for perfumery would only grow here in hot-houses. The only flower which might be had in abundance would be the rose, but the smell of it is very faint compared with that of the Southern rose, and the rose-water made in this country can never equal the French in strength. If we add to this the shortness of the flowering season, and the high price of land and labour, we may arrive at the conclusion that such a speculation would be as bad as that of attempting to make wine from English grapes. As a proof of this, I may mention that I had a specimen submitted to me not long since of a perfumed pomade which a lady had attempted to make on a flower-farm, which she had been induced to establish in the north of England, and it was, as I expected, a complete failure. The only two perfumery ingredients in which the English really excel are lavender and peppermint, but that is owing to the very cause which would militate against the success of other flowers in this country, for our moist and moderate climate gives those two plants the mildness of fragrance for which they are prized, whilst in France and other countries they grow strong and rank.

Before I take leave of the subject of distillation, I may be allowed to mention my system of vaporizing perfumes, which is a sort of inverted distillation, for whilst the object of distilling is to concentrate the aroma of fragrant substances, that of vaporizing is to divide it *ad infinitum*. I was led to this discovery in a very curious way. Some years ago, Madame Céléste was bringing out at the Lyceum a new fairy piece, called "Chrystabelle; or, the Rose without a Thorn." The great transformation scene was to represent a bower of roses, and she came to me to ask if I could supply her with some means of diffusing the scent of roses during the scene. My first answer was that it could not be done, as the various systems for perfuming the air had been hitherto confined to the combustion of aromatic gums and woods, which all gave an incense flavour very unlike roses. On thinking over the matter, however, it struck me that steam, owing to its great power of extension, might be used as a vehicle for carrying fragrant molecules in a rapid and powerful manner through the atmosphere. I constructed an apparatus on this principle, and the experiment succeeded so well that the perfume vaporizer has been used extensively since, not only for scenic effects, but also on a reduced scale in ball-rooms, apartments, &c. The peculiar advantage of this system is to give the fragrance of any particular flower in all its purity; thus on the day of the marriage of the Prince of Wales, the reception rooms adjoining St. George's Chapel, which had been perfumed in that way, breathed an atmosphere of violets, though none were to be seen. The potency of these vapours is also so great that a large theatre like Her Majesty's or Covent Garden is entirely filled with them in five minutes. Now, by substituting aromatic plants for flowers, you produce reviving fumes, which have been thought sufficiently prophylactic to be adopted by the Royal College of Surgeons and several hospitals. The question has been discussed and not satisfactorily settled, whether these aromatic fumes *destroy* or only *cover* unpleasant and deleterious smells—but it is very certain that they render them totally imperceptible, and that is a great point gained. There is a very curious fact connected with these scented vapours, which is that the weakest perfume, such as that of violet, is sufficient to overcome a strong persistent smell like that of tobacco. I have often tried this experiment myself by lighting a small vaporizer in a room where several persons had been or were still smoking, and in the course of a few minutes nothing but the perfume was perceptible. I shall feel much obliged to any scientific man who can give me the cause of this phenomenon.

The apparatus usually employed for vaporizing perfumes consists in a water-bath containing a pan fitted with a bent pipe, the lower end of which is bored with small holes. Perfumed water is placed in the water-bath, and

prepared scent in the pan; heat is then applied by means of a spirit lamp, and the steam evolved from the water-bath passes through the pipe into the upper vessel,

Sectional View of Perfume Vaporiser.

where it meets with the perfume and causes it to rise in a pour through the apertures on the top. A more simple apparatus is also used where the perfume is merely heated, and when only required for a few minutes; and in a small room, it answers as well as the other. The re-

The Revolving Vaporiser.

living vaporizer, a recent modification of the apparatus is placed on a pivot, and has on the top two very small apertures placed in a contrary direction. It is poised in such a way that the steam, as soon as it is generated, passes through the apertures and causes it to revolve with great rapidity.

The fourth process I have to describe to you is that of expression, which is confined to the fruits of the citrine family, viz., orange (*Citrus aurantium*), bitter orange (*Citrus bigaradia*), lemon (*Citrus medica*), bergamot (*Citrus bergamia*), cedrate (*Citrus cedrata*), and lime (*Citrus melia*). The rinds of all these fruits contain an essential oil ready formed in small vesicles, and various means are adopted to extract it. On the coast of Genoa they beat the fruit against a grated funnel; in Sicily they press the rind in cloth bags, and in Calabria, where the largest

quantity is manufactured, they roll the fruit between two bowls, one placed inside the other, the concave part of the lower and the convex part of the upper being armed with sharp spikes. These bowls revolve in a contrary direction, causing the small vesicles on the surface of the fruit to burst and give up the essence they contain, which is afterwards collected with a sponge. The rinds are also sometimes distilled, but the former processes, which are called in French *au sec*, give a much finer essence.

The three principal essences of this kind used are orange (called also Portugal), lemon, and bergamot, which all enter into the composition of eau de Cologne and many other perfumes. They are made in Calabria and Sicily in the months of October, November, and December, and the quantity of fruits required to make 1 lb. of essential oil varies as follows during that time:—

	October.	November.	December.
Oranges	1,500	2,000	2,300
Lemons	1,500	1,800	2,000
Bergamots	1,800	2,000	2,300

The essence produced by squeezing the rind is yellow; that made with the machine has a green tint. The following quantities are produced yearly on an average:—

	lbs.	Fruits.
Orange ...	300,000	made with about 540,000,000
Lemon ...	500,000	" " 750,000,000
Bergamot ...	300,000	" " 600,000,000

Perfumery is not the only use to which are put aromatic flowers and plants; vast quantities are also gathered and sold for medicinal purposes, especially on the continent; but as this part of my subject belongs to the domains of pharmacy, I must leave it to be treated by a more competent person than myself.

In conclusion, allow me to return you my very best thanks for your kind and courteous attention, and to say that if any of you feel any particular interest in the subject I have had the pleasure of introducing to your notice, they will find in the book I lately published all particulars respecting the history of ancient and modern perfumery.

Fine Arts.

PARIS EXHIBITION OF FINE ARTS APPLIED TO INDUSTRY. —The collection of porcelain and *faïences* shown here is very remarkable, and includes specimens from almost every country and every style—French, Italian, German, and Oriental, very many of the pieces being of extreme rarity. Amongst the enamels, those of Limoges are naturally the most numerous; but the collection of Italian and other historical works is extremely fine. Next in importance are the classes of furniture, tapestry, iron-work, and other objects of domestic utility and decoration, ranging from the 16th to the 18th century, and in many cases having historic as well as artistic interest. The collection of armour and arms, ancient and modern, European and Oriental, which is already a fine one, will shortly receive a very important addition; the Emperor recently paid a visit to the Exhibition, and offered his fine private collection of arms to the director. The arms in question occupy a special gallery in the Tuileries, and consist of about a thousand pieces, principally of the period of the middle ages and the renaissance. A separate room is being prepared for their reception. The Venetian and other glass forms another important feature in the Exhibition. The carved works in ivory and wood also present many fine specimens of mediæval skill. There are good collections of small bronzes of the 15th, 16th, and 17th centuries; of old German and other silver ware; of enamelled and jewelled snuffboxes; *bonbonnières*, and other small articles. In the modern portion of the Exhibition the works are classed under nine heads:—

Decoration of buildings, wall decorations, furniture, works in metal, precious metals and costly substances, glass and ceramic wares, tissues for clothing and domestic use, miscellaneous articles, including carriages, arms, cutlery, bookbinding, and ornaments; and lastly, printing, engraving, and photography. The iron work applied to architectural and domestic purposes exhibits decided progress, especially that in which the ornamentation is produced by the hammer in the old style. A pair of park gates, pedestals and brackets for lamps, chandeliers, fire-dogs, fire-irons, and many other articles, exhibit great manual dexterity, coupled with simplicity and purity of design. Of chased, enamelled, and decorated goldsmiths' work there are some beautiful examples in the Exhibition; a portable communion service, or *chapelle*, as it is called, in silver gilt, engraved and studded with precious stones, exhibited by M. Geoffroy, of which the forms, the engraving, and the whole of the workmanship are solid and extremely elegant; a silver beer tankard decorated with hoptine in *repoussé* work in the old German style, by M. Fanniere; a silver gilt casket, ornamented with enamels and set with stones, from the well-known house of Froment Meurice; cups and other articles in steel, chased, engraved, and ornamented in the style of Louis the Thirteenth, by M. Philippe; a noble vase and other works in silver, chased and oxidized, by Rudolphi; silver and plated ware exhibited by M. Veyrat, and many other remarkable works of the same kind. Porcelain and *faience*, especially the latter, also exhibit the same spirit of artistic revival, not yet quite so fully developed. In the exhibition are many direct reproductions of the works of Palissy and other famous potters, executed with more or less ability, but there are also innumerable specimens of the judicious application of the old styles to modern taste. The large vases and other objects in *faience* scarcely exhibit so much skill in their manufacture as many of the productions of our own makers, but the decorated slabs and medallions exhibit a rare amount of artistic talent, and in some the colours are perfect, especially the blue. At present the cost of this artistic pottery is high, but it is evident that the time is approaching when they will be brought within the reach of almost everyone, and a brighter and more durable species of decoration it is hardly possible to imagine. French cutlery is another branch of manufacture which is making great strides, and the specimens in the Exhibition deserve special attention. Bronzes, gilt, and other ornamental wares for which Paris has so deserved a reputation are, of course, well represented, but they present no special progress or novelty.

PUBLIC STATUES IN FRANCE.—A grand *fête* took place last week at Villiers Bocage, a small place not far from Caen, in Normandy, at the inauguration of the statue of Richard Lenoir, who for forty years laboured with the greatest energy, and did the most signal service for the French cotton manufacture, and yet, after being one of the wealthiest manufacturers in France, and having laid the foundation of thousands of fortunes, died a poor man. The statue, by Louis Rochet, is one of the happiest efforts to give dignity to a costume of the most ungainly and unpromising character; the large frock-coat of the empire, with its square, stiff, prominent collar, which the artist has treated with daring exactitude, artistically seizing upon the ample skirt to break the formality of the effect, and give a flowing form to his outline. Richard Lenoir, besides being an industrial hero, and almost a martyr, engraved his name on the memory of his countrymen by placing himself at the head of his workmen and aiding in the last struggle against the legitimists and their allies in 1815. Villiers Bocages, the place of his birth, does not contain more than twelve hundred inhabitants, but thousands flocked to the inauguration from all parts of France. A statue has also been raised in honour of the astronomer Arago, at his birth-place, Estagel, in the department of the Pyrenées Orientales; the sculptor, M. Oliva, is also a native of the Pyrenées.

Manufactures.

COPPER SMOKE.—The following is from the *Reader*.—Several ineffectual attempts have been made, during the last fifty years, to abate the nuisance caused by the copper smoke which is given off during the calcining of the ore. Copper-smelters are in the habit of paying large sums as compensation for the damage done to the vegetation in the neighbourhood of their works by the clouds of valuable copper smoke which are allowed to pass into the air. Thousands of pounds are annually wasted in this manner; but up to the present time no plan has been found to answer practically for utilizing the smoke. Messrs. Vivian and Sons, the eminent copper-smelters of Swansea, who have already made great efforts in this direction, are about to adopt an improved roasting-machine for which the inventor, M. Gerstenhöfer, a chemist of Freiberg, took out a patent in 1858. It has hitherto been the practice to perform the roasting operation in kilns, grate furnaces, or muffles. In the first case the stamped ore is mixed with clay or loam, is formed into balls, which are then dried. When the balls are used, the pounded pyrites is spread on plates of clay, and required to be kept continually stirred to expose fresh surfaces to the air. Neither of these processes answers practically. M. Gerstenhöfer's improved machine is described as consisting of "a vertical chamber constructed of fire-brick, and fitted with a series of horizontal bearers (formed of fire-brick) distributed evenly through the body of the furnace, for the purpose of intercepting, and thereby distributing the crushed ore as it is discharged through the top of the furnace from suitable feeding boxes. * * * The upper face of the bearers is made flat, to receive the ore, and after accumulating on the upper bearer it slides off on to those lower down, and so on, until it finally falls to the bottom of the furnace, at which time it is supposed to have parted with its sulphur." The gases, passing out at the mouth of the furnace, are led into a large chamber; first, however, heating the pipes which supply air to the grate, where they deposit "the dust of roasted ores, and also the arsenious acid." The gases are now ready to pass into the ordinary sulphuric acid chambers. The inventor states in his specification that "the Royal Saxon Sulphuric Acid Works have made a trial with a furnace of the improved construction with so great a success that it is now almost exclusively employed for the roasting of pyrites at that establishment." The working of this furnace has been carefully investigated by Messrs. Vivian, who expect to make 100 tons of sulphuric acid per week from the copper smoke which would otherwise be worse than wasted. We are therefore, not surprised to hear that Messrs. Vivian have paid the inventor £4,000 for his patent right.

WAKEFIELD INDUSTRIAL AND FINE ART EXHIBITION.—This exhibition was opened by the president, at Houghton, on Wednesday, 30th August. The inaugural address was delivered by the president, after which the Archbishop of York and other gentlemen spoke at length on the advantages to be derived from such exhibitions. The building in which the exhibition is held consists of a large vestibule, with a picture gallery on either side. Besides these galleries, the temporary building contains a large central hall, 100ft. by 60ft., a refreshment room. The Tammy Hall is entered by steps from the central hall, and contains, besides a lower room with shafting, which, in consequence, has been assigned to machinery in motion; above this is an upper room, the walls of which are covered with a painting. The exhibition is held in six rooms, which contain about 17,000 square feet of floor and table space, and 17,000 square feet of wall space. The number of exhibitors, including the fine arts department and the dresden, amount to 1,300.

EXHIBITION AT THE SARACEN FOUNDRY, GLASGOW.—A private exhibition of the articles produced in the iron

hours of the workmen in this establishment was recently held in the Moulders' Shop, which had been set apart for the purpose. The origin of so novel an attempt was as follows:—For several years back the moulders have been in the habit, on the occasion of their annual excursion in August, of decorating their sand heaps with devices of various kinds, and last year so much talent was displayed in this respect, that the company awarded prizes to the more remarkable of the designs, and intimated that next year they would award prizes to the amount of £22 2s., in connection with a private industrial exhibition in the foundry, which would include not only specimens of the men's own ingenuity, but also that of their families and of their female friends. The employees themselves subscribed an equal amount, and the result was the present exhibition. One rule of the exhibition was a rather noticeable one, namely, that no articles were allowed to be exhibited illustrating the company's manufacture, so that the specimens on view were in an unusual degree the result of natural genius. There were in all eight sections—namely, 1. For the best object in either nature, art, or industry. 2. For the best essay delivered at the Saracen Foundry Mutual Improvement Society during the session 1864-5. 3. For the best object or decoration made in moulding sand by journeyman moulders. For the best object or decoration made in moulding sand by apprentice moulders. 4. For the best specimen of female industry in needlework, knitting, &c. 5. For the best drawing. 6. For the best original composition in prose or verse. 7. For the best writing. 8. For the best specimen of writing by counting-house employees only. In one of these sections there were 36 competitors, and in another 24, and many of the articles shown were such as to reflect highly on the skill and industry of the exhibitors. The third section was in many respects the most interesting of all, comprising as it did numerous and curious designs in moulding sand. The first prize was for an elaborate design illustrative of the parable of the Good Shepherd; and the second for an imitation of Burns' monument. Mr. Walter Macfarlane, of the Saracen Foundry Company, delivered an address, and distributed the prizes.

Commerce.

COFFEE.—Messrs. Travers' circular says:—"The progressive decline in the consumption of coffee is surprising, as the quantities of nearly all other articles of produce have become much greater of late years. The home consumption reached its highest point for the last fifteen years in 1854, when it amounted to 16,674 tons; in 1864 it was only 14,000 tons, and we have now to chronicle a decrease of 315 tons for the first six months of 1866, as compared with the corresponding part of 1864. The reduced cost of tea, and the rapid advance it has made in public favour, have principally brought about this result; but, at the same time, the smaller use of coffee may, to a great extent, be traced to the way in which it is generally prepared in England. The preparation of coffee for use requires some little care and attention, which are seldom bestowed upon it by English people. The result is that, as a nation, drink the worst-flavoured coffee in Europe, although we are supplied with the best raw material, and we pay the best price for it. The preparation of tea, on the other hand, requires little care, and the result is always certain, if enough be put in the pot. Labour being dear and time of value, coffee in England goes to the wall, and tea usurps its place. On the continent the contrary is the case, and coffee is as yet in the ascendant. England is the chief *entrepôt* from which continental supplies are drawn; and we may thus form a tolerably correct inference of the state of consumption abroad by the exports from British ports. These amounted in 1854, when our home consumption was at its highest, to 14,548 tons; but in 1864 amounted to no less than 35,406 tons; and the Board of Trade returns for the six months of

this year show a surplus of 1,769 tons in the export deliveries, as compared with the first half of 1864. Coffee planters need thus have no fear of extending their operations at present—the more so as the United States will be more and more in the market. At the same time, we fear that the use of coffee in England will be still further diminished by the late reduction in the tea duty."

COAL TRADE IN EUROPE.—The extraction of coal in France in 1863 was estimated at 10 million tons, and the import of foreign coal was 5,344,260 tons; the consumption amounted to 882 lbs. per head. Belgium produced 10 million tons, but exported 3,500,000 tons. The 6½ million tons which it consumes represents 2,822 lbs. per head, or three times as much as France. England produces 86 million tons of coal, of which 7,934,000 tons were exported. The internal consumption, therefore, is about 78 million tons, which represents 6,894 lbs. per head, or about seven times as much as in France. One-third of the coal used in France is imported from England, Belgium, and Prussia.

CLOCKS AND WATCHES IMPORTED.—From a return recently issued, it appears that in the seven months ending the 31st July, as many as 129,082 clocks and 86,814 watches were imported free of duty.

Colonies.

PROGRESS IN NEW SOUTH WALES.—The increase of population by immigration to New South Wales, from 1860 (after separation from Queensland) to 1864 inclusive, has been—Immigrants, arrived under Government Assisted Immigration Regulations, 15,903; other arrivals from Great Britain, in excess of departures to Great Britain in five years, only 1,495; arrivals by sea from other colonies and foreign ports in excess of departures to same, 480; arrivals by sea of Chinese in excess of departures, 5,721; total, 23,599. Notwithstanding the depression of the times, the purchase of land by free settlers goes on rapidly. The total quantity purchased from the time when the Act came into operation (1st January, 1862) to 30th September, 1864 (2 years and 9 months), being no less than 630,653 acres, and the sum paid as deposits alone during that time amounting to nearly £160,000. The following figures give the number of purchasers and the quantity of land selected in 1864:—

Year.	Acres.	No. of Purchasers.
1862	294,186	4,562
1863	212,035	3,551
1864 to Sept. 30 ...	124,432	1,890
	630,653	10,003

From almost every district the most encouraging statements respecting the progress the colonists are making are received.

SILVER MINES IN NEW SOUTH WALES.—It has been determined to resume operations at the Mornya Silver Mines by a new process, which has been tried with a model machine on the ores of this mine, and which is stated to have been completely successful in extracting the precious metals. Two trials have been made on the ore with very satisfactory results, the first trial giving four ounces of gold and ten ounces of silver to the ton of ore, and the second trial giving three ounces of gold and fourteen ounces of silver to the ton of ore.

NEW TARIFF IN NEW SOUTH WALES.—The act to impose stamp duties would come into operation on the 1st of July. It is estimated that the revenue to be derived from these duties will amount to £150,000. On the 25th May the treasurer proposed an addition of 20 per cent. customs duties on all goods included in the tariff, and a duty of 1s. on all goods imported into the colony. The resolutions submitted to the Assembly met with some opposition, and were amended by exempting tea, sugar, brandy, and gin from the package duty.

COPPER MINES IN NEW SOUTH WALES.—The reports from these mines continue to be of a satisfactory character. The quality of ore is improving, and the lodes are more productive as depth is obtained.

Notes.

CITY HORTICULTURE.—A recent number of the *Scottish Farmer* says that a large number of influential gentlemen in Edinburgh have lately associated themselves for the support of what may be termed a Working-Class City Horticultural or Window Gardening Society. The promoters of this philanthropic movement issued a circular in March last inviting 'working people to contribute to a flower show for the working classes living in the various districts of Edinburgh. Prizes of sums from 1s. to 5s. were given, open to working men and women; and prizes from 6d. to 2s., open to boys and girls under 15 years of age. Any flowering plant was admitted. In all, 114 prizes were offered. It appears that there are now, both in Edinburgh and Glasgow, some very successful examples of area gardening, where, considerably under the street levels, healthy and well-grown ferns, including that most elegant of all, the *Osmunda regalis*, as well as many kinds of shrubby, herbaceous, and climbing plants, are thriving in vigorous luxuriance, the evil effects of the street dust and city smoke being counteracted by frequent washings of the foliage, and that generally by merely sprinkling it with water from the finely-drilled rose of a small watering-pan, discharged occasionally shower-like from the higher windows, or over the railings from the street above. With regard to the choice of plants for this purpose, the above-named journal says:—"There are many plants which will not thrive under the best management in town windows, areas, &c.,—let all such be discarded; and we would further recommend working-class cultivators not to be too ambitious in their selection, but to choose from observation those plants most suitable, whether native or exotic, hardy or tender. To juvenile growers of hanging pot plants we would say, have an eye to that hardy and pretty woodland native 'creeping jenny,' also called 'herb twopenny,' and still more earnestly *Lysimachia nummularia*. Aspire to the possession of a plant of the recently-introduced hardy Japan honeysuckle, which is unsurpassed for the beauty of its golden lace-like foliage; and do not neglect the common ivy, one of the easiest managed of evergreen creepers, and of which there are now about half a hundred varieties in cultivation, all differing from one another in the colour, form, and size of their leaves; and among these, some with variegated and spotted, as well as peculiarly-formed green foliage, are unsurpassed as flower-pot evergreens, either for growing inside or outside. The general attention now and lately bestowed upon window gardening has been the means of calling forth several highly interesting and useful publications and essays on the subject; foremost among which is the paper read by Mr. John Bell before the Society of Arts last session."

SPECIAL EDUCATION IN FRANCE.—The Minister of Public Instruction has just issued a circular to the Prefects of departments announcing the intention of the Government to establish a special normal school at Cluny. The object is to create a class of teachers which neither the high schools of Paris nor the primary normal schools supply, instructed in matters connected with the applied sciences, and able to explain to the pupils not only the principles of industrial operations, but also the methods in actual practice. The new school is to be established in the ancient Benedictine abbey at Cluny, a spot well situated for the purpose, being in the centre of a rich province, where all forms of cultivation are to be found—cornland, meadow, vineyard, and forest, near Creuzot, the seat of a great mechanical industry, on the one hand, and Lyons on the other, and not far from St. Etienne; so that the pupil teachers will be placed in very advantageous cir-

cumstances. Candidates are to be admitted by competition, in order that all may be nearly on a par as regards general instruction, and the pupils will receive their diplomas after public examination. The school will be open to all on the above conditions, but the Government will support the pupil teachers required for the Lycée. The departments are called upon to aid the work by applying one or two of the scholarships in each primary normal school to the new establishment, the pupil teachers to be selected from the departmental schools by competition. The modes of carrying out the object in question are not yet fully decided on, but the Minister expresses his intention of proposing to the Emperor that the pupils who pass their examination in the new school shall enjoy a portion of the advantages attaching to University degrees; and announces further that as the professors of the new school must be men of high standing, and as laboratories, workshops, collections, gardens, and other means of practical study, must be complete, the value of each course will be higher than in the ordinary normal schools, and he fixes it at eight hundred francs (£32).

The Programme of Examinations for 1866 is now published, and may be had gratis, on application to the Secretary.

Proceedings of Institutions.

GLASGOW MECHANICS' INSTITUTION.—In the forty-second annual report the directors point with a degree of pride to the very prosperous session. With few exceptions the attendance of the classes has been higher than ordinary; while the quality of work accomplished decidedly superior. With a view to secure a larger attendance in the natural philosophy and chemistry classes, the directors have reduced the fee in these classes to 2s. 6d., entitling students to the membership of the institution, to attendance on twenty-four lectures, and the use of the library for six months, and the experiment has proved so far successful in both classes. In the Chemistry Class (Dr. W. Wallace) the course of lectures was, this session, devoted to chemical technology, or chemistry applied to manufactures and the useful arts. The number enrolled in the Natural Philosophy Class (Mr. J. P. Smith, C.E.) is 112, and the attendance throughout the session has been little short of that number. The subjects of lectures have been the properties of matter, the principles of mechanics, gravitation, optics, heat, electricity, magnetism, &c. In the Music Class (Mr. Samuel Barr) the teacher was highly pleased with the progress made. The Animal Physiology Class (Mr. John Mayer, C.S.), although not numerically strong, has been very successful, both as regards regularity and attendance and the amount of work done. The Elocution Class (Mr. Wm. Moffat) consisted of 22 members, with an average attendance of 16. They have been trained to read distinctly, significantly, and expressively; the progress made by all having been very considerable. The Mechanical Drawing Class (Mr. P. Stewart) has had another very successful session. The classes for Drawing, Painting, and Architecture (Mr. A. D. Robertson) have also been successful. The number enrolled in the class of Practical Mechanics (Mr. J. P. Smith C.E.) is 42, and the attendance throughout the session has been good. The subjects taken up were the principles of mechanics—

gravity, strength of materials, theory of structures, principles of equilibrium in simple machines, friction, wheel-work, principles of dynamics, theory of machines, combustion of fuel, generation of steam, steam boilers, &c. A similarly favourable account is given of the English Language and Literature Class (Mr. D. Buchanan). The Writing, Arithmetic, and Book-keeping Class was under Mr. John Macgregor, teacher, and Mr. Robert Stevenson, assistant. The duties of this department had become increasingly arduous, and were, during the past session, shared between the teacher and an assistant. The number of students in attendance demanded all the accommodation available, whilst the work performed was good. In the Mathematics and Arithmetic Class (Mr. A. Thom), the students were arranged into a junior and a senior class. The junior students, in addition to the more advanced rules of arithmetic, read the first three books of Euclid, with the more useful propositions in the fifth and sixth books; algebra, as far as simultaneous equations, and the summation of series. The senior students read the first six, with the eleventh and twelfth books of Euclid; analytical trigonometry, with the application of logarithms to the solution of problems in trigonometry and mensuration. In the senior class the students were permitted to occupy half their time in whatever branch of the science they thought fit, some taking the differential calculus, others trigonometry, mensuration, or navigation. The classes in Latin and Greek (Mr. J. Miller, A.M.) have been attended this session by gentlemen belonging to or preparing for the legal and medical professions; by young men preparing for the University, and by others engaged in commercial and mechanical pursuits. Favourable accounts are given of the French (Mons. Dutoit) and the German (Herr Rehbann) classes. In the Spanish class (Mr. A. Revie) there has been a small increase in the numbers over those of last session, the tickets sold being 49 against 44. Some of the students have made considerable progress. The History and Geography class (Mr. D. Buchanan) and the Botany class (Mr. W. Keddie) have been prosperous. The library contains upwards of 7,000 volumes, a large addition having been made during the year. Besides the students attending the classes, the library is opened to the public at the annual charge of 4s. Considerable additions have been made to the museum, the accommodation of which is now largely extended. The museum is open for the inspection of members and students of the Institution, and friends, free of charge. The tickets sold for the evening classes have been as follows:—Chemistry, 118; Natural Philosophy, 112; Music, 79; Animal Physiology, 19;

Practical Mechanics, 42; Elocution, 22; Botany, 36; Mathematics, 244; Mechanical Drawing, 253; Free-hand and Architectural Drawing, 157; Writing, Arithmetic, and Book-keeping, 384; Grammar, Composition, and Literature, 145; French, 166; German, 36; Spanish, 49; Latin and Greek, 113; Dancing and Calisthenics, 6; History and Geography, 18; total, 1,999. The income has amounted to £2,097 Os. 5½d., and there was cash in hand £375 18s. 4d.

EXAMINATION PAPERS, 1865.

(Continued from page 638.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

GERMAN.

THREE HOURS ALLOWED.

Each candidate is expected to translate one of the passages of Section I., to answer some of the questions, and to turn into German several of the sentences and pieces given in Section III. Candidates for a first class, must translate one piece of Section I., answer (e), (f) and (g) of Section II., and render into German 16—20 inclusive, of Section III., and write the essay:—

SECTION I.

1. Dieser Tag war es, um dessentwillen Gustav das baltische Meer durchschiffte, auf entlegener Erde der Gefahr nachjagte, Krone und Leben dem untreuen Glück anvertraute. Die zwei grössten Heerführer ihrer Zeit, beide bisher unüberwunden, sollen jetzt in einem lange vermiedenen Kampfe mit einander ihre letzte Probe bestehen; einer von beiden muss seinen Ruhm auf dem Schlachtfelde zurücklassen. Beide Hälften von Deutschland haben mit Furcht und Zittern diesen Tag herannahen sehen; bang erwartet die ganze Mitwelt den Ausbruch desselben, und die späte Nachwelt wird ihn segnen oder beweinen.

Die Entschlossenheit, welche den Grafen Tilly sonst nie verliess, fehlte ihm an diesem Tage. Kein fester Vorsatz, mit dem Könige zu schlagen, ebenso wenig Standhaftigkeit, es zu vermeiden. Wider seinen Willen riss ihn Pappenheim dahin. Nie gefühlte Zweifel kämpften in seiner Brust, schwarze Ahnungen umwölkten seine immer freie Stirn. Der Geist von Magdeburg schien aber ihm zu schweben.

2. Ist Frieden stiften, Haas
Versöhnen ein Geschäft der Hölle? Kommt
Die Eintracht aus dem ew'gen Pfluh hervor?
Was ist unschuldig, heilig, menschlich gut,
Wenn es der Kampf nicht ist uns Vaterland?
Seit wann ist die Natur so mit sich selbst
Im Streite, dass der Himmel die gerechte Sache
Verliert, und dass die Teufel sie beschützen?
Ist aber das, was ich dir sage, gut,
Wo anders als von oben konnt' ich's schöpfen?
Wer hätte sich auf meiner Schaftertrift
Zu mir gesellt, das kind'che Hirtenmädchen
In königlichen Dingen einzuweihn?
Ich bin vor hohen Fürsten nie gestanden,
Die Kunst der Rede ist dem Munde fremd.
Doch jetzt, da ich's bedarf, dich zu bewegen,
Besitz' ich Einsicht, hoher Dinge Kunde,
Der Länder und der Könige Geschick
Liegt sonnenhell vor meinem Kindesblick,
Und einen Donnerkeil fñhr' ich im Munde.

3. Alter Freund! immer getreuer Schlaf, fliehst du mich auch wie die übrigen Freunde? Wie willig sinktest du dich auf mein freies Haupt herunter und kühltest, wie ein schöner Myrthenkranz der Liebe, meine Schläfe! Mitten unter Waffen, auf der Woge des Lebens, ruht' ich leicht athmend, wie ein aufquellender Knabe, in deinen Armen. Wenn Stürme durch Zweige und Blätter sausten, Ast und Wipfel sich knirschend bewegten, blieb

innerst doch der Kern des Herzens ungerührt. Was schüttelt dich nun? Was erschüttert den festen truen Sinn? Ich fñhl's, es ist der Klang der Mordart, die an meiner Wurzel nascht. Noch steh' ich aufrecht und ein innerer Schauer durchfñhrt mich. Ja, sie überwindet's verrätherische Gewalt; sie untergräbt den festen Stamm, und eh' die Rinde dorrt, stñrzt krachend und zerschmetternd deine Krone. Warum denn jetzt, da es so oft gewalt'ge Sorgen gleich Seifenblasen dir vom Hau weggewiesen, warum vermagst du nicht die Ahnung zu vercheuchen, die tausendfach in dir sich auf und nieder treibt? Seit wann begegnet der Tod dir fñrchterhaft mit dessen wechselnden Bildern, wie mit den abgeblasen stalten der gewohnten Erde, du gelassen lebstest.

4. Ottokar von Böhmen, ein viel mächtigerer Fürst als der Graf von Habsburg, glaubte keineswegs dem Kaiser gehorchen zu müssen. Dazu kam, dass die reichlichen Stände bittere Klagen gegen König Ottokar erhoben, wie er sie bedrückte und viele Ungerechtigkeiten übe. Also liess Rudolph zuerst den König einladen, er auf dem Reichstage zu Nürnberg im Jahre 1274 erscheinen und von Rechtswegen den Lehnseid leisten. Aber der König kam weder diesesmal, noch auf dem zweiten Tage zu Würzburg; und auf einen dritten zu Augsburg, im Jahre 1275, schickte er nur den Bischof Wernhard von Seckau als seinen Gesandten, und dieser war so dreist, vor den versammelten Fürsten eine lateinische Rede anzuhören, worin er bewies, dass Kaiser Rudolph's Wahl ungültig sei. Rudolph zerbrach ihn, und sprach: "Herr Bischof, wenn ihr es mit meinen Geistlichen abzumachen habt, so redet in lateinischer Sprache, wenn's aber mich oder die Reichsstände angeht, so redet deutsch, wie es der Brauch ist." Die Fürsten, da sie inne wurden, der Bischof würde Rudolph's Kaiserwahl antasten, enthielten sich ihm, dass sie ihn nicht zur Thüre hinaustrieben; aber der König verhinderte es und liess den Bischof am nächsten Tage von Augsburg abreisen.

SECTION II.—GRAMMAR AND IDIOMS.

- Decline *derselbe, dieselbe, dasselbe, and wer*.
- When does the superlative end in *sten* and *he* before it? Give three examples.
- Decline *das harte Schicksal*—schwerer Sinn, mer bestes Pferd.
- Put the definite article before the following substantives, and add the genitive singular and the dative plural:—*Berg, Kenntnis, Braut, Thaler, Blau, Maus, Hand*.
- In what do separable compound verbs differ from the inseparable. Illustrate their differences by ten examples.
- State the second person singular, present and perfect, both in the indicative and subjunctive of:—*Befehlen, bieten, ablassen, verstehen, nachgeben, versorgen, bedürfen*. Add also the participle past of each of these verbs.
- Es ist gar nicht mit ihm anzukommen.
Das wird noch übel ablaufen.
Ich mache mir gar nichts daraus.
Es geht im Hause um.
Er hat sich umgebracht.
Reden Sie doch nicht so ins Blaue hinein.
Der hat das Pulver auch nicht erfunden.
Wer sich nur darauf verstände!
Setzen Sie mir das einmal auseinander.
Damit hat er mir einen Streich durch die Rechnung gemacht.
Er wird nimmermehr auf einen grünen Zweig kommen.

SECTION III.

Translate into German ten of the following passages. The writing, either in English, or German character, must be very legible.

- That is all the same to me.
- I am going to buy three sorts of wine.
- He arrived in town at half-past three in the morning.

They have been in this country these sixteen years.
 They who are cruel cannot be good.
 We who have long experience know more about it.
 I should like to know what has become of them.
 My brother is only eight years and a half old.
 They have been obliged to leave town.
 He had a new carriage made for him.
 The judge ordered him to be whipped.
 I have often been asked about the cause of it.
 He ought to have been ashamed of himself.
 The older he grows, the weaker he becomes.
 We have heard her sing but once.
 We received their answer but yesterday.
 I insist upon your doing it directly.
 Having left his house but ten minutes ago, he cannot have reached his office.
 She is said to be a very clever writer.
 It seems clear, that the wages of labour, estimated money, were in 1685 not more than half of what they now; and there were few articles important to the king man, of which the price was not in 1685 more a half of what it is now. Beer was undoubtedly cheaper in that age than at present. Meat was cheaper, but was still so dear that hundreds of thousands of families scarcely knew the taste of it. In the case of wheat, there has been very little change. The average price of the quarter, during the last twelve years Charles the Second, was fifty shillings. Bread, therefore, such as is now given to the inmates of a workhouse, is then seldom seen, even on the trencher of a yeoman or a shopkeeper. The great majority of the nation almost entirely on rye, barley and oats.

Write in German a short essay on "The causes of tea."

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

BIRMINGHAM, 1865.

The business of the Sections commenced on Thursday, 7th instant. The following is a list of the papers:

THURSDAY, SEPTEMBER 7TH.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

President's address.
 Benjamin Jenkin—Report of the Electrical Standards Committee.
 James E. Glaisher—Report on Luminous Meteors.
 Professor Rankine—On the Second Law of Thermodynamics.
 Sabine—On a New Method, introduced by Messrs. Bunsen, of measuring Electrical Resistance.
 F. Hooper—On India-rubber, as an Insulator for Telegraphic Conductors.
 Claudet—On Moving Photographic Pictures.
 C. Sorby—On a New Form of Spectrum Microscope.

SECTION B.—CHEMICAL SCIENCE.

Opening Address by the President.
 C. Sorby—On a New Form of Spectrum Apparatus applied to the Microscope.
 A. Abel—Notes on Compounds of Copper and Phosphorus.
 A. Voelcker—On the Composition of a Marine Boiler.
 T. Phipson—On Silicium in Iron.
 T. Phipson—On the Sublimed Oligist of Vesuvius in Artificial Production.
 T. Phipson—A few words on Sponges as a source of Ammonia and of Nitrogen.

SECTION C.—GEOLOGY.

The President's Address.
 Rev. W. S. Symonds—On some Ancient Drifts and Old River Beds of Siluria.
 W. Pengelly—The Insulation of St. Michael's Mount.
 Rev. W. Purton—The Geology of Colebrookdale.
 G. Maw—On the Extensive Deposits of White Clays and Sands in North Wales—antecedent to the Boulder Clay Drift.
 C. J. Woodward—On a Deposit near Lilleshall, Salop, containing recent Marine Shells.
 Professor Harkness and H. Nicholson—Additional Observations on the Geology of the Lake Country.

SECTION D.—ZOOLOGY AND BOTANY.

J. Gwyn Jeffreys, F.R.S.—Report on Dredging in the Channel Islands. (Mollusca.)
 Rev. A. Merle Norman, A.M.—Report of the Committee appointed to investigate the Marine Fauna of the Channel Islands. Part II.
 J. Gwyn Jeffreys, F.R.S.—Report on Dredging on the Coast of Aberdeen.
 William Hinds, M.D.—On the Identity of Origin of Starch and Chlorophyll.
 W. R. Hughes, F.L.S.—Notes on the Development of a Deep-Sea Sponge in a Marine Aquarium.
 Rev. A. W. McKay—On the *Turdus Migratorius*.
 H. T. Stainton, F.L.S.—On the extraordinary Partiality shown by insects of the Genus *Laverna* for Plants of the order Onagraceae.
 S. Moffat, M.D., F.G.S.—Phosphorescence in connection with Storms and Disease.

SUB-SECTION D.—PHYSIOLOGY.

The President's Address.
 Dr. John Davy—On the Effects of Scanty and Deficient Food.
 Dr. Lionel S. Beale—On Life.
 Dr. John Hughes Bennett—On the Formation of Pus in Reference to the Fallacious Doctrine of Cell Pathology.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

Captain Wilson and Captain T. McNeil—Results of Surveys in Palestine.
 G. Grove—On the Exploration of the Holy Land, as proposed by the Palestine Exploration Fund.
 Colonel L. Pelly—Seychelle Islands.
 S. W. Baker—Letters on the discovery of Albert Nyanza, from Mr. S. W. Baker to Sir R. I. Murchison.
 Colonel L. Pelly—Comoro Islands.
 D. A. Vámbéry—Origin of the Hungarians.
 Colonel Phayre—Ethnology of the Hindu-Chinese Nations.
 Colonel L. Pelly—Shores of the Persian Gulf.
 Robert Swinhoe—Notes on Formosa.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

The President's Opening Address.
 Thomas Avery—On the Municipal Expenditure of the Borough of Birmingham.
 W. L. Sargent—On the Vital Statistics of Birmingham. Reports on Local Industries (First Group):
 George Heaton—Die Sinking.
 J. P. Turner—Button Manufacture.
 W. Bridges Adams—On the Division of Labour.

SECTION G.—MECHANICAL SCIENCE.

President's Address.
 Sir W. G. Armstrong, C.B., F.R.S.—On Chain proving.
 E. A. Cowper—On a new Cotton Gin for separating the fibre from the seed.
 Thomas Levick—On machinery for compressing air, and the applicability of such compressed air for working coal-cutting and other underground machinery.

D. K. Clark—On Torbite (a new preparation of peat) and its uses.

R. W. Thomson—Description of a Rotary Steam Engine.

FRIDAY, SEPTEMBER 8.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Mr. Glaisher (Chairman of the Lunar Committee)—Report of the Committee.

Mr. Birt (Secretary of the Lunar Committee)—On the Progress of the Map of the Moon.

J. B. Capello and B. Stewart—On the Magnetic Storm of the beginning of August last, as recorded by the instruments at Kew and Lisbon.

Dr. Gladstone—On the Refraction Equivalent of Carbon.

Professor H. Smith—Report on the Theory of Numbers.

Professor Stevelly—On the Application of D'Alembert's Principle to the Rotation of a Rigid Mass.

Professor Price—On the Extension of Taylor's Theorem, by the Method of Derivations.

Professor T. A. Hirst—On Quadric Transformations.

Rev. R. Harley—On Differential Resolvents.

Mr. W. H. L. Russell—On the Calculation of the Potential of the Figure of the Earth.

Dr. Mansfield Ingleby—On a Method for discovering remainders in Arithmetical Division.

Oliver Byrne—On Dual Arithmetic.

SECTION B.—CHEMICAL SCIENCE.

Dr. Angus Smith—On a Method of Estimating Carbonic Acid in the Air, with Apparatus.

Dr. Williamson—Report on the Analysis of the Gases evolved from the Bath Waters.

F. Grace Calvert—Notes on the Action of Acids on some Metals and Alloys.

Dr. J. E. de Vry—On the possibility of Manufacturing Neroli in the British Colonies.

Owen Rowland—On the Properties of Parkesine, and its Application to the Arts, Manufactures, and Telegraphy.

F. G. Finch—On the Utilisation of Blast Furnace Slags.

Dr. A. Voelcker—On recently discovered Phosphatic Deposits in North Wales.

Dr. Frankland—On the Constitution of the Acids of Acetic, Lactic, and Acrylic Series.

SECTION C.—GEOLOGY.

Henry Woodward—A description of a new Chart of Fossil Crustacea.

W. M. Williams—Some Vegetable Deposits in the Achensee—North Tyrol.

Geheimrath Von Dechen and Professor F. Römer—On the large Prussian Geological Map of the Rhenish Provinces and Westphalia.

First Report of the Committee for the exploration of Kent's Cavern.

Professor Harkness—On the Metamorphic Rocks and Serpentine Marbles of Connemara and Joyce's Country.

Professor Tennant—On the Agates found in England, with specimens from different countries.

SECTION D.—ZOOLOGY AND BOTANY.

W. Lander Lindsay, M.D.—On the Relations of the Southern to the Northern Flora of New Zealand.

George Humphry, M.D., F.R.S.—On the Homologies of the Lower Jaw and the Bones connecting it with the Skull in Ovipara.

W. F. Hiern—On *Ranunculus radicans* Revel as a British Plant.

Dr. E. Perceval Wright—Notes on the Voracity of *Chiasmodon*, by Dr. Carto, F.L.S.

Rev. A. M. Norman, M.A.—On the Structure and Development of *Salpa spinosa* Otto, as observed at Guernsey.

Dr. E. Perceval Wright exhibited a Copy of the "Record of Zoological Literature for the Year 1864."

Dr. Jordan—An Examination of the British Lepidoptera, with a view to investigate the Origin of Species.

SUB-SECTION D.—PHYSIOLOGY.

Dr. Fleming—On the Prevalence of Tapeworm in Birmingham and its Causes.

Dr. Cobbold—Remarks on Specimens of Entozoa.

Dr. Cobbold—On Beef and Pork as Sources of Entozoa.

Professor Rolleston—Certain Points in the Anatomy of *Lumbricus terrestris*.

Dr. Davy—Is the Opinion that a diet of Animal Food conduces to Leanness well Founded on Facts?

Dr. Richard Norris—Rigor Mortis not Muscular Contraction.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

Thomas Baines—Victoria Falls of the Zambesi.

J. Crawford, F.R.S.—Occidental or Western Negroes.

E. B. Taylor—Negro-European Dialects of the Negroes of Surinam and Curaçoa.

Dr. Cullen—Isthmus of Panama and Inter-oceanic Ship-canal Routes.

Dr. Cullen—Darien Indians.

R. Brown—Researches in Vancouver Island.

T. W. Farrar—Language and Ethnology.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

Reports on Local Industries (Second group):—

J. S. Wright—Jewellery and Gilt Toys.

Dr. Lloyd—Flint Glass.

Professor Leone Levi—Statistical Data in relation to the Representation of the People.

G. J. Johnson—Statistics of the Benefit Building and Freehold Land Societies of Birmingham.

SECTION G.—MECHANICAL SCIENCE.

Wm. Fairbairn, LL.D.—Report of the Gun-Cotton Committee.

Henry Bessemer—On the Manufacture of Cast Steel: its Progress and Employment as a Substitute for Wrought Iron.

Wm. Fairbairn, LL.D.—On some of the Causes of the Failure of Submarine Cables, and their Construction.

C. W. Siemens, F.R.S.—On the Sheathing of Deep-Sea Cables.

William Hooper—On India Rubber considered in reference to its Applicability as an Insulator for Telegraphic Conductors.

SATURDAY, SEPTEMBER 9.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Principal J. D. Forbes—On the Laws of the Conduction of Heat in Bars.

J. P. Gassiot—On the Change of Form and Colour which the Stratified Discharge assumes when a varied resistance is introduced in the circuit of an extended series of the Voltaic Battery.

F. Galton—On Spectacles for Divers, and on the Vision of Amphibious Animals.

Captain Selwyn—On some New Arrangement of the Poles in Magnets.

J. P. Harrison—On the Heat attained by the Moon under Solar Radiation.

SECTION B.—CHEMICAL SCIENCE.

This Section did not meet on Saturday.

SECTION C.—GEOLOGY.

S. Bailey—The Economic Value of the various Measures of Coal and Ironstone in the South Staffordshire Coal Field.

H. Johnson—The extent and duration of the South Staffordshire Coal Field.

W. M. Williams—The Ancient Glaciers of the North and East of Llangollen, and more particularly in the Hope Mountain.

Principal Dawson—The Successive Palæozoic Floras in Eastern North America.

Rev. W. Fox—An Account of the New Saurian *Poecanhus* from the Wealden.

Rev. H. Housman—Fossil Footprints in the New Red Sandstone at Brewood, near Wolverhampton.

R. A. Peacock—On extensive and deep Sinkings of Lands in the Channel Islands Seas, and on some Changes of the French Coast of the Bay of Biscay within the Historical Period.

R. A. Peacock—On Steam as an active agent in Earth-quakes.

D. Mackintosh—The relative extent of Atmospheric and Oceanic Denudation, with a particular reference to certain rocks and valleys in Yorkshire and Derbyshire.

Rev. A. M. McKay—The Red Sandstone of Nova Scotia.

J. E. Taylor—On Contortions in the Chalk at Withingham, near Norwich.

J. W. Salter—Explanation of a Map of the Faults in the Gold District of Dolgelly.

T. A. Readwin—On the recent Discovery of Gold at Gwynllynnydd, North Wales.

SECTION D.—ZOOLOGY AND BOTANY.

This Section did not meet on Saturday.

SUB-SECTION D.—PHYSIOLOGY.

This Sub-Section did not meet on Saturday.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

J. Crawford—History of Cannibalism.

Dr. R. S. Charnock—Cannibalism in Europe.

J. Crawford—Papuan and Oriental Negroes.

Dr. Mueller—McIntyre's Journey across Australia, and Discovery of Traces of Leichhardt.

R. Dunn—On the influence of Civilization upon the Cerebral Development of the different Races of Men.

R. Swinhoe—On the Native inhabitants of Formosa.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

This Section did not meet on Saturday.

SECTION G.—MECHANICAL SCIENCE.

This Section did not meet on Saturday.

MONDAY, SEPTEMBER 11.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

James Glaisher—Report of the Balloon Committee.

G. J. Symons—Report on the Rainfall of the British Isles.

Dr. Gladstone—Interim Report of the Committee on the Transmission of Sound under Water.

F. W. Brearey—Remarks upon Aërial Navigation, suggested by Mr. Glaisher's late ascents.

A. F. Osler—On the Horary and Diurnal Variations in the Direction and Motion of the Air.

A. F. Osler—Suggestions respecting an Anemometer adapted for recording the Force of Hurricanes.

Professor Price—On some Applications of the Theory of Probabilities.

W. Symons—On an Improved Standard Barometer.

S. B. Howlett—On a Self-recording Anemometer.

SECTION B.—CHEMICAL SCIENCE.

Professor Wanklyn—Report on some of the Differences between the Normal and the Beta Alcohols.

Dr. D. S. Price—On the Action of Light upon Sulphide of Lead, and its bearing upon the Preservation of Paintings in Picture Galleries.

Report of the Committee on Gun Cotton.

Manning Prentice—The Progress of the Manufacture of Gun Cotton and its application to Mining, Military, and Sporting purposes.

W. L. Scott—On the Action of Alkali Metals on Gun Cotton.

W. L. Scott—On Arseniuretted and Antimoniuretted Hydrogens.

J. Smyth, Jun.—On an Apparatus for the determination of Ozone, and experiments made therewith.

Dr. De Vry—On the Rotatory Power of several Essential Oils.

Dr. Macadam—On Esparto Fibre, or Spanish Grass, and its employment in the Manufacture of Paper.

Dr. Macadam—On the Results of Agricultural Experiments made in 1864.

D. Forbes—On some Minerals from South America. On the Colour of Gold as seen by transmitted light.

T. Fairley—On the Reactions of Cyanogen. Note on Glycocine, with tables.

SECTION C.—GEOLOGY.

H. Hicks and J. W. Salter—Report on Further Researches in the Lingula Flags of South Wales.

D. Forbes—First Report on the Igneous Rocks of Staffordshire.

W. Molyneux—Further Report on the Distribution of the Organic Remains of the North Staffordshire Coal Field.

C. Twamley—On the Faults in the South Staffordshire Coal Field and their relation to the Igneous Rocks of the District.

W. Ness—On the Coal Measures in Mold Valley and their Products.

Rev. P. B. Brodie—On the Fossiliferous Beds of the New Red Sandstone (Upper and Lower Keuper) in Worcestershire.

Professor Harkness and H. Nicholson—On the Silurian Rocks of the Isle of Man.

H. Woodward—Description of a new Phyllopodous Crustacean from the Moffat Shales, Dumfriesshire.

E. Ray Lankester—On British Species of Cephalaspis and the Scotch Pteraspis.

Rev. La Touche—On the Nodules in the Limestone of Wenlock Edge.

SECTION D.—ZOOLOGY AND BOTANY.

Dr. Duncan—A description of Two New Species of Aporose Madreporaria, from Guernsey.

Dr. Scott—On the Occurrence of *Orcynus alalonga* on the Coast of Devon.

C. Spence Bate and Professor Westwood—On the genus *Ancuus* (*Ancuus Risso* and *Praniza Leach*).

E. Ray Lankester—Notes on Annelida from the Coast of Guernsey.

P. P. Carpenter—On the regard due to usage and utility, as well as mere priority in fixing Zoological Nomenclature.

F. Buckland—Report on the Culture of Oysters.

H. S. Ellis—To Exhibit some Tiles with young Oysters.

Dr. Mörcb—On the Classification of the Mollusca.

Dr. Mörcb—On the Zoological Affinities of the Mollusca.

Ed. Newton, M.A., a letter from, relating to a Remarkable Discovery of Bones of *Didus* in the Island of Rodriguez.

Rev. F. Hewlett—On the occurrence of the bones of extinct Struthious Birds in New Zealand in the same Oven with those of the Dog.

SUB-SECTION D.—PHYSIOLOGY.

Dr. B. W. Richardson—Report on Amyl Compounds.

Dr. George D. Gibb—Refutation of the view recently propounded that the food comes into contact with the vocal cords in deglutition.

William Turner—On Variability, as manifested in the construction of the human body.

Professor Rolleston—Certain points in the Anatomy of two Animals from the Mammoth Cave, Kentucky.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

C. R. Markham—On a North Polar Expedition.

Admiral Ommanney—On North Polar Exploration.

T. Wright—On the true assignation of the Bronze Weapons, &c., supposed to indicate a Bronze Age in Western and Northern Europe.

D. Macintosh, F.G.S.—On the Comparative Anthropology of England and Wales.

J. Evans, F.R.S.—On the Worked Flints of Pressigny le Grand.

Dr. Charnock—On the Origin of the Gipsies.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

David Morris—On the past and present Productive Power of Cotton Machinery.

Mr. Edward Vivian, M.A.—On the admission of Illegitimate Children into Workhouses, as a means of preventing Infanticide.

Professor Rogers—On Patents and Copyright.

SECTION G.—MECHANICAL SCIENCE.

F. J. Bramwell—On Weldless Tyres, Circular Rolling and Railway Wheels.

S. N. F. Cox—On Siemens' Regenerative Gas Furnaces and Producers.

J. Robinson—On some Developments of, and Improvements in, Giffard's Injector.

George Fawcus—Suggestions for Improvements in Blocks for Lowering Ships' Boats: Improvements in Boats.

Cornelius Varley—On the Ventilation of Separate Rooms, and of Large Assemblies, and Coal Mines.

TUESDAY, SEPTEMBER 12.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

Professor Plücker—On a New Method in Geometry.

Professor Sylvester—On a Peculiar Class of Questions in the Theory of Probabilities.

Professor Sylvester—On Professor Price's Modification of Arbogast's Method.

Professor A. H. Curtis—On certain Theorems in Laplace's Discussion of the Figure of the Earth and Precession and Nutation.

Professor T. A. Hirst—On Chasles' Method of Characteristics.

J. B. Capello—On the great Storm of December, 1864, on the Coast of the Peninsula.

J. Hartnup—On the Self-registering Barometer at the Liverpool Observatory.

T. L. Plant—On the Anomalies of our Climate.

D. Smith—On the Meteorology of Birmingham from 1853 to 1864.

L. Oertling—On the Hydrometer.

Captain Landy—On the Topograph, a new Surveying Instrument.

Cornelius Varley—On an Instrument by which any Rainbow that is possible to appear within the area of any picture may be indicated in its right place and of the true size.

SECTION B.—CHEMICAL SCIENCE.

T. Wood—On the New Formulae with reference to Schools and Examinations.

Professor Maskelyne—On Crystallised Melaconite and Tenorite.

W. White exhibited Photographs of the Interior of the Great Pyramid taken with the Magnesium Light by Professor C. Piazza Smyth, with notes thereon.

W. Willis—On the Aniline Process in Photography.

W. L. Scott—On the Formation of Ammonia from Nitrogen in the Atmosphere.

W. L. Scott—On the Presence and Functions of Ammonia or its Homologues in the Blood.

J. C. Bowring—On the Preservation of the Shathing of Ships, and Extraction of Silver from Sea Water, by means of Electricity.

J. C. Bowring—On the Direction of the Electric Current.

Dr. Crisp—On the Food and Habits of the Mole, Sparrow, and Vespide.

E. J. Lowe—On the Propagation of Ferns by Means of Spores.

Dr. Hinds—On a Monstrosity of the Rose.

Rev. W. H. Sterling—On the Natives of Patagonia and Terra del Fuego. Some boys from Terra del Fuego were introduced to the Section.

SUB-SECTION D.—PHYSIOLOGY.

Dr. M. Foster—On Pericardial Fluid.

Prof. Macdonald—On the Parasitoid Type of the early Fœtal Development.

Dr. A. Gamgee—Note of Experiments confirmatory of those of Kühne on the non-existence of Ammonia in the Blood.

Dr. W. H. Lightbody—On the Vascular Arrangements of the Cornea.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

J. D. Goodman—Statistics of the Small-Arms Manufacture of Birmingham.

Rev. J. W. Bain—The Social, Moral, and Educational Status of the population of South Staffordshire.

Professor Bennett—Statistics of Pneumonia.

G. B. Galloway—Suggested Improvements applicable to the City of London, and other large towns, to improve Health and preserve Life.

G. B. Galloway—Means of Saving Life from Buildings which may be on Fire.

G. B. Galloway—Inter-communication between Railway Passengers.

J. T. Arlidge, M.B.—On the Duration of Life, the prevailing Diseases, and the Causes of Death of Pottery.

Robert Wilkinson—A statistical review of the police-recognised drunkenness of the metropolis.

Henry C. Roper—The Physical and Geographical Features of the Country ten miles round Dudley, with remarks upon the natural drainage area as bearing upon the Sanitary Condition of the district.

TECHNICAL TRAINING OF ARTISANS.

The following account of the institutions for the technical training of artisans in France has been prepared by Mr. J. F. Iselin, from the documents collected by Mr.

T. Twining, in pursuance of the inquiry advertised to in the *Journal of the Society of Arts* for January 18, 1865:—

With a few special and important exceptions, which there will be occasion to notice further on, the whole of the technical instruction of France is under the immediate direction of the Minister of Agriculture, Commerce, and Public Works. Among the establishments which are directly under state supervision, are the Polytechnic School (*Ecole Polytechnique*), the School of Bridges and Roads (*Ecole Impériale des Ponts-et-Chaussées*), and the School of Mines (*Ecole Impériale des Mines*). These, however, are chiefly for the instruction of Government officials.

The Central Imperial School of Arts and Manufactures (*Ecole Centrale des Arts et Manufactures*), at Paris, was founded in 1829, as a private establishment, under the business direction of M. Lavallée, who was also its original capitalist. Dr. Lyon Playfair,* having visited it in 1852, speaks in the highest terms of this institution.

The only assistance which at that time it received from Government was in the form of an endowment for a certain number of exhibitions to educate students of humble means. The Councils-General of Departments occasionally grant a similar favour to deserving young men. As a commercial speculation, this school seems to have been singularly successful. That it has been highly appreciated by those for whose benefit it was established, will be seen by the following extract from a Report by the Budget Committee of the Chamber of Deputies:—

"You know, gentlemen, this useful establishment, founded in 1829 by the association of eminent professors, with the intention of forming civil engineers, the directors of works, the chiefs of workshops and factories. This private institution, which in its importance rivals in excellence our first public establishments, has created and put in practice a complete system of industrial education. It is at the same time a supplement to our Polytechnic School and an addition to our various schools of application. Such an institution ministers to one of the first necessities of the age, and therefore its success is complete. This is confirmed by the unanimous opinion of the first manufacturers of the country, and by the ease with which all the pupils educated at it have received employment."

The report here quoted was made shortly before Dr. Playfair's visit, when the school was attended by 300 students, all day pupils (*externes*), instructed by a staff of forty professors. The annual school fees amounted to £36. The courses of instruction were arranged to extend over three years,† "in the second year the practical operations being divided into two parts, the one general and the other applicable to one of the following four specialities,—mechanists, engineers, metallurgists, chemists."

In 1858 this school was given up to Government, and is now, like most other technical schools in France, under the direction of the Minister of Agriculture, Commerce, and Public Works, as above stated. The system and courses of instruction remain the same as under the former régime. The latter comprise Descriptive Geometry, Practical and Theoretical Mechanics, Analytical and Industrial Chemistry, Metallurgy, Mining, and Geology, as well as the direct and practical application of these sciences to the industrial arts. The classes are open to foreigners, and it is a remarkable proof of the estimation in which the school is held, that Belgium, Germany, Spain, and even England, not only send pupils there for the benefit of a technical education which they are unable to receive in their own country, but also show themselves anxious to obtain the services of other pupils of the establishment as managers of some of their most important manufactures. Indeed,

General Morin and M. Treasca* complain that scarcely 50 per cent. of the students who have passed the school remain in France; the remainder obtain situations on foreign public works and railways.

Much, however, as is done by this school for the advancement of technical knowledge, it will be perceived that the advantages which it offers are confined to the higher classes of the technical community. It is in fact admirably adapted to provide the more scientific industries of the country with trained and able managers and masters; but it offers no corresponding benefits (nor is it intended to do so) to artisans engaged in handicraft trades.

CONSERVATOIRES OF ARTS AND TRADES (*Conservatoire des Arts et Métiers*).—This magnificent establishment owes its origin to the collection of machines, models, and philosophical instruments left to the French nation by the great mechanician, Vaucanson, in 1783, which became the nucleus of the present splendid museum. It will not here be necessary to give a description of these remarkable collections, already well known in England; it is desirable rather to call attention to the educational work undertaken by the institution. The royal ordinance of 1819, creating four professorships in science—mechanics, physics, chemistry, and public economy applied to industry—first gave the Conservatoire an educational character, and since that time the addition of other professorships has still further increased its usefulness.† The present scheme of this institution is the instruction of the working classes in the principles of the sciences bearing on their trades and manufactures by means of lectures delivered by the professors. In addition, the large amphitheatre of the establishment is used for public lectures. When any discovery or invention is made, either in France or in foreign countries, of sufficient interest to arts, industry, or commerce, drawings or exact descriptions are obtained, deposited in the amphitheatre, and publicly explained. All new processes are likewise shown by practical and experienced workmen, under the direction of the several professors.

The following was the programme of free and gratuitous lectures for the years 1863 and 1864:—

Applied Geometry	Prof. Baron C. Dupin.
Descriptive Geometry	" M. de la Gourmerie.
Applied Mechanics	" M. Treasca.
Building Construction	" M. Trélat.
Physics	" M. E. Becquerel.
Applied Chemistry	" M. E. Peligot.
Chemical Manufactures	" M. Payen.
Agriculture	" M. Moll.
Agricultural Chemistry	" M. Boussingault.
Zoology	" M. Baudement.
Spinning and Weaving	" M. Alcan.
Printing and Dyeing	" M. Persoz.
Industrial Legislation	" M. Wolowski.
Industrial Economy and Statistics	" M. J. Burat.

It appears from the statements of General Morin and M. Treasca that the influence of this institution is, like that of the preceding one, rather confined to the higher industrial classes.

Not less important in their action in the progress of French industry, and by some even thought more beneficial, are the three Schools of Arts and Trades (*Ecoles Impériales des Arts-et-Métiers*), established at Châlons

* Rapports des membres de la Section Française du Jury International sur l'ensemble de l'Exposition. Classe xxix.—Méthodes et matériel de l'enseignement élémentaire. Section viii.—Enseignement industriel, par M. le Général Morin, membre de l'Institut, directeur du Conservatoire des Arts et Métiers, et M. Treasca, sous-directeur du Conservatoire des Arts et Métiers.

† Papers relating to proposals for establishing Colleges of Arts and Manufactures for the better instruction of the industrial classes, by Lt.-Col. J. A. Lloyd, F.R.S., F.G.S., Special Commissioner at the Exhibition of 1851.

* Industrial Instruction on the Continent, being the Introductory Lecture delivered at the Government School of Mines for the Session 1852-53, by Lyon Playfair, C.B., F.R.S. (Longman, 1852).

† Dr. Playfair's Introductory Lecture.

Angers, and Aix, so situated as conveniently to embrace in their influence the whole extent of the country.

The following description is abridged from the prospectus issued by the Minister of Agriculture, Commerce, and Public Works:—

The Imperial Schools of Arts and Trades are designed to form foremen and heads of workshops (*chefs d'ateliers*), as well as skilful and well-informed workmen. The course of study extends over three years. The instruction is both theoretical and practical. The former comprises the French Grammar, Geography, Writing, Descriptive Geometry and Machine Drawing, Arithmetic and Book-keeping, Geometry, Algebra up to and inclusive of Quadratic Equations, Mechanics, and the Elements of Chemistry and Physics. The practical instruction is given in four workshops, and embraces forging and founding, working in wood and at the lathe, and the fitting both of machines and models. The works executed are of the same nature as those issued from any well-arranged factory, such as steam engines, machine-tools, and pumps, besides ironwork and hardware, and carpenters' and joiners' work.

In each school there is room for 300 pupils, some of whom are exhibitioners. All of them are boarders (*internes*), no day-scholars (*externes*) being received. They are admitted every year by competition at an examination held in the beginning of August before a local board (*jury special*) in each department. Every candidate for admission must be, at the time of his entering the school, between fifteen and seventeen years of age; be able to read fluently, to write a current hand, to spell, to work the first four rules of arithmetic, with vulgar and decimal fractions; have a knowledge of the elements of plane geometry and linear or ornamental drawing; and have completed an apprenticeship to some trade or handicraft analogous to those taught in the school. The admission is confined to natives of France; a foreigner is allowed to compete only under exceptional circumstances, and by special permission of the superior administration.

The fees for board and tuition amount to £24 (600f.) a year, and a sum of £8 (200f.) is required to be deposited by way of outfit before the pupil can enter the school. There is, however, a very liberal allotment of exhibitions, partly supported by the Government and by the departmental budgets, in addition to which, each school possesses 25 scholarships (*bons de dégrèvement*), reducing the school-fees by one-fourth, which are distributed to the pupils at the termination of the annual examination.

At the end of the third year, the students about to leave receive each a certificate of the marks they have obtained during their school course, and of the position they have held every half-year in their respective classes. No other diploma is given. At the same time the first fifteen of such students receive a silver medal, and can also claim, at the end of one year, a sum of £20 (500f.) to be used as a premium in establishing themselves in business. Another prize of £15 (375f.) is given to the best pupil in each workshop. Finally, to the three pupils among the above-mentioned fifteen most distinguished for progress in their studies and for good conduct, a sum of £100 (2,500f.) is distributed, being the interest of an endowment left to the schools; by M. Jourdain, an eminent manufacturer. Thus nothing is wanting in the way of prizes to stimulate exertion and reward proficiency and good conduct.

The results attained are stated by the director of the school of Chalons to be most satisfactory. He more particularly claims attention for the geometrical drawing, in which he says his pupils exhibit remarkable ability. It rarely happens that three months elapse after a pupil leaves one of these schools, before he obtains advantageous employment.

It will be asked—what influence do these schools exercise on French industry? The answer may be given in the words of General Morin and M. Tresca:—"Every year they turn out and send into our factories three hundred young men, with mind and hand both formed.

Some, and these are the majority, establish themselves as draughtsmen, and display great skill in fitting and arranging machinery, and in devising the most suitable forms. The remainder, after having wrought as workmen, attain quickly the position of foreman, and often are able to commence on their own account a manufactory of metal ware or a carpenter's shop. We are in a position to instance a large number of manufacturers of the first rank, who have received their education at the schools of arts and trades. Distinguished by their principals for their practical ability, they were promoted to the direction of important factories. Not less than a fifth of the number of members of the Society of Civil Engineers were formerly students at these schools."

It will be noticed that in these schools more attention is paid to the practical portion of technical instruction than in the institutions before described. The workshops, where the pupils are brought face to face with the details of manufacture, and in which they are compelled to take their share of manual labour, form a distinguishing feature and a valuable addition.

In founding an institution of this kind in England one of the desirable changes would be a still greater extension of its sphere of action in certain directions, especially as regards what may be called the domestic handicrafts; but far more important modifications would be required in order to open the enjoyment of its benefits to the generality of our working population. It must be borne in mind that in France the workmen's sons who constitute the majority of the candidates to the free schools in question are enabled, through the gratuitous educational facilities afforded to them, to give proof, in the examinations for admission, of a degree of knowledge which only the favoured few among our own rising industrial generation can at present command.*

MINING SCHOOL (*Ecole des Mineurs*) at St. Etienne, AND SCHOOL FOR MASTER MINERS (*Maître Mineurs*), at ALAIS.—These mining schools, the only French institution for special industrial training under government direction remaining to be noticed, are less numerously attended than the trade schools, but have an equal proportion of success. The purpose for which they were established is to render the same kind of assistance to the mining industry which the trade schools afford to manufactures. Both of them are under the management of the engineers of the Imperial Corps of Mines.

The two schools, however, have different objects in view. At St. Etienne the programme of the conditions of admission is very nearly the same as that for the Schools of Arts and Trades. The pupils are fitted to become viewers and captains of mines or directors of metallurgical works. Alais is intended to turn out master miners only, and the pupils on their admission are not submitted to an examination in either geometry or drawing. During their attendance at the schools they work in the mines on the footing of ordinary miners, and they are supposed to earn their maintenance and schooling.

In attempting to give a summary of what the French Government has done for technical education, and how far it meets the wants of the nation, we cannot do better than quote once more the able report of General Morin and M. Tresca:—"On reading merely the list of names of these" (government) "establishments devoted to industrial education, we can pronounce at once an opinion as to their extreme insufficiency. One hundred engineering diplomas are awarded every year by the minister to the students quitting the central school of arts and manufactures; three hundred leave annually the schools of arts and trades with certificates of their studies; and if we add two hundred young men to represent the free students of the school of bridges and roads and the

* Independently of the various free schools for children and adults, which in towns include instruction in drawing and elementary mathematics, and evening schools for art applied to technical industry, gratuitous scientific courses are delivered at communal expense by the professors of local colleges.

school of mines, those of the schools of St. Etienne and of Alais, and lastly, the few pupils who, after the completion of their studies in the Polytechnic and other special schools, sooner or later turn their attention to industrial pursuits, we arrive at a total (rather over-estimated than otherwise) of six hundred individuals to recruit annually the intelligent and more or less educated body which directs our French manufacturing industries. If we estimate the whole number of persons engaged in these industries at 1,200,000, we perceive that the above total represents very nearly one two-thousandth of the population of our works. Admitting that the mean duration of service be twenty-five years for the one number as for the other, it follows there will be one trained man over eighty operatives; one corporal to eighty privates—but a very small proportion of captains.

"If this army of workers were not stimulated by the necessity of supporting itself, it is evident that its staff would be absolutely incapable of guiding it; it finds its way almost by itself. Without guidance or rule of conduct it continues, regarding it as a whole, to do that which it has done before; it presents an inertia which individual exertions cannot overcome. A good system of industrial education, which opens out a new horizon to those who from their youth are devoted to an industrial career, would alone be capable of exercising on them an appreciable influence, but even then we must not look for an immediate result. The new generation will differ but little from its predecessor until the system of industrial instruction be made perfectly general.

"If, in place of forming a judgment on the results of our establishments for technical education as a whole, we examine their organisation in detail, we shall immediately perceive that each one has a different object in view; that they are perfectly independent one of the other; and that, founded under the influence of completely distinct ideas, they can in no way form an entire system to be compared with the organisation of the University education, of which what are called the liberal professions reap the exclusive advantage."

When an opinion as decided as this, on the insufficiency of the government establishments, is expressed by so good an authority, it is not surprising that many private efforts have been made in France for the same object. The results of these efforts will perhaps be examined at some future opportunity.

Fine Arts.

STATUE OF DR. JENNER AT BOULOGNE.—A statue of the famous English physician, Jenner, the introducer of vaccination, has been inaugurated at Boulogne. The sculptor of the statue is M. Eugène Paul. This is not the first monument that has been erected in France in honour of Dr. Jenner.

EXHIBITION OF WATER-COLOUR DRAWINGS IN PARIS.—A remarkable exhibition of this kind is now open at the gallery situated on the Boulevard des Italiens, in Paris. M. E. Hildebrandt, a German artist, who enjoys a high reputation on the Continent, and who has travelled over the greater part of the world in pursuit of his art, exhibits no less than three hundred water-colour drawings. The differences which exist amongst the methods employed by English and foreign artists in the treatment of water-colours, apart from the ability of the artist in question, render this exhibition especially worthy of the attention of English artists and amateurs.

Commerce.

CHINESE OPIUM.—The Chinese prefer the Indian to the native drug. The native opium is, though very much

cheaper, insipid, and very few of the Chinese smoke native opium unless it is mixed with the Indian. If they can get the Indian, of course, so much the better; but a Chinaman reduced to a state of poverty to which the state of opium smoking invariably leads, unable to purchase the Indian, mixes the native with the Indian, or even gathers up the cinders of Indian opium twice smoked and smokes them a third time. Native opium is sold for about 600 taels; while native Shensi opium is sold for about 400 taels. In 1862 native opium was offered in the market at 650 taels; this rise in the price of native opium was caused by political disturbances in Shensi, ultimately calmed down by means of bribes and donations, which threatened with extinction the whole trade of that province. The quantity of Indian opium imported into the Tientsin district depends entirely on the state of the Shensi crop. When the Shensi crop is deficient the demand for Indian opium increases, and vice versa. Of the Indian imports into Tientsin, 150 to 200 chests a week are purchased for consumption in the capital. What Peking consumes of the native drug is not known, but the quantity must be large.

SUPPLY OF COTTON.—The following is from Messrs. Smith, Edwards, and Co.'s Circular for the 1st September:—"The prospects of our market still turn chiefly upon the supply of cotton to be expected from America, and considerable difference of opinion continues to exist upon that point; estimates, however, have a tendency to converge to a central point, and we should say that one million and a-half of bales of sound cotton as the total supply for the old stock and new crop is the favourite opinion among commercial men in America. There are some who consider one million or a million and a-quarter an adequate estimate, and a few still believe in two millions, but the great majority of competent authorities point in the direction we have stated. It is perfectly evident, however, that no certain data yet exist for forming a reliable opinion, and it is not unlikely that great changes of feeling will pass over the commercial mind before the end of the year. The progress of receipts at the ports will do much to influence estimates of the stock, and if, as seems likely, there is a period of large deliveries, we may expect a revival of larger estimates at least for a time. The receipts at New Orleans and Mobile have already reached a pretty large scale, say 80,000 bales weekly, and as the Northern consumption is only 10,000 to 12,000 bales per week at present, there is no reason why the surplus should not soon come to this country. There are now in the various American ports nearly 200,000 bales of cotton, and we think it probable that the shipments to this country will soon rise to 10,000 or 15,000 bales per week. There is, therefore, at last, the prospect of substantial relief to our spinners from the side of America, but from other quarters of the world the prospect is not hopeful. China still discontinues sending us cotton, and the supply at sea has almost run out; the importance of this fact may be estimated when we consider that she sent us 400,000 bales last year, averaging 240 lbs. each, or equal to fully 200,000 bales of American cotton. Very little Bengal and Scinde cotton is also coming forward, and as we received some 300,000 bales of these kinds last year, a large diminution in them would leave a serious blank to fill up. Speaking generally, it appears likely that we shall receive a smaller supply of short-staple Eastern cotton, at least to the extent of 250,000 bales of the size of American packages, as compared with what we got last year; and assuming that receipts from all other places continue the same, we would require to get 700,000 bales from America next year to give us a clear surplus of 250,000 bales over the receipts of 1864. This is evidently not a state of things that points to a permanent great decline in the price of cotton; and the period when full supplies of the raw material will be afforded to our manufacturing industry is obviously not yet within sight, and the stimulus of high prices will be required for years to achieve that result."

Colonies.

VINTAGE IN SOUTH AUSTRALIA.—The acreage now cultivated with vines in this colony is, 6,384 acres; during the past five years the area has doubled. Up to last season the proportion of bearing vines to those not yet productive was nearly equal; the present returns show 469,609 vines in bearing to 2,831,971 unproductive. Only a short period has to elapse before the whole of the extensive vineyards planted during the past few years will be in full bearing, so that the annual production will be annually augmented. Already the figures are high, for the vintage of the present season cannot be estimated at less than 1,000,000 gallons. That of last year was 798,647 gallons; that of 1863, 604,805 gallons. The home consumption is large, but it would be satisfactory to find a demand in a foreign market, which has not at present been the case, the exports of the year amounting to only 20,674 gallons, or 7,031 gallons less than in 1863.

LIVE STOCK IN SOUTH AUSTRALIA.—The live stock returns show an additional number of horses and sheep, but a large reduction in the number of cattle. Owing to the protracted drought in the far north it was difficult to make the returns. The number of horses is returned as 62,899, or 3,891 more than last year; 643 horses, valued at £10,996, were exported during the year. As showing the importance of this trade, it may be stated that during the past five years 3,224 horses have been shipped, chiefly to India, of a total declared value of £69,748. The total number of sheep depastured was 4,106,820, or 214,580 additional, showing an increase of 5 per cent. upon last year. During the twelve months 186,526 sheep were exported overland to the neighbouring colonies in excess of the imports, or 21,259 more than in 1863.

WATER SUPPLY IN VICTORIA.—A measure has been recently brought before the Colonial Parliament for supplying the country districts of the colony with water. For several years the metropolis and suburbs have had an abundant supply of good water from the Yan Yean reservoir, which was constructed at a cost of £800,000 to £900,000, and is capable of containing 25,000,000 cubic yards of water. Little or nothing, however, has been done to extend similar advantages to other parts of the colony, which have experienced much inconvenience, and this has been more than usually felt during the past summer owing to the long drought. The annual rainfall quite sufficient to furnish the colony with enough water for all purposes all the year round, but as the rain chiefly falls in winter months it is necessary to store it. Nature has afforded excellent facilities for storage, and the chief merit of the scheme submitted by the Minister of Mines to turn these facilities to account by the construction of dams, reservoirs, and aqueducts. It is an extensive plan, embracing all parts of the colony except Gipps Land. Upwards of twenty distinct works are contemplated. The estimated cost of the whole work is about £1,200,000. As an example of the nature of the works and the quantity of water it is intended to store, and to be in a position to supply the different localities, the works contemplated for the town of Geelong may be instanced. The population of Geelong is about 25,000 inhabitants. The reservoirs to be constructed are to be capable of containing 100,000,000 gallons, the area of the watershed 11,000 acres, and the quantity to be supplied per diem is 1,000,000 gallons, the approximate cost of the works being £15,000. The largest work projected is the Cobban scheme, from the circumstance that the supply of water is principally obtained from that river. It will benefit a large mining and agricultural district, the population of which is 10,000. Reservoirs are to be constructed capable of containing 4,000,000,000 gallons, the area of the watershed being 64,000 acres. The quantity to be supplied per diem is 30,000,000 gallons. The estimated cost is £20,000.

Obituary.

J. G. APPOLD, F.R.S., died on the 31st August, at Clifton. Mr. Appold was well known among engineers and men of science for his great ingenuity as an amateur mechanic. His centrifugal pumps formed striking features of the Great Exhibitions, both in 1861 and 1862. He shared with Mr. Hawkshaw the credit of first suggesting the use of syphons for draining off the flood waters in the fen country, when the embankment there gave way some time ago, and, to a great extent, the paying-out apparatus used in laying submarine telegraphs was his contrivance. Some of the most remarkable proofs of his cleverness as an inventor, however, were collected in his own house and the works adjoining it. There everything that could be made so was automatic. The doors opened as you approached them, and closed after you had entered; water came unbidden into the basins; when the gas was lighted the shutters closed; a self-acting thermometer prevented the temperature rising or falling above or below certain fixed points; and the air supplied for ventilation was both washed to cool it and screened to cleanse it from blacks. Even the gates of his stableyard opened of themselves as he drove through, and closed again without alighting. Mr. Appold was a dresser of furs by a secret process, which he practised successfully for many years. He was elected a member of the Society of Arts in 1853, and took much interest in its proceedings.

Notes.

PUBLIC WORKS IN FRANCE.—It appears from official returns that the great viaducts constructed on the lines of the French railways form a total of more than seven leagues in length. That of Meudon, which is about 150 yards long and 100 feet high, cost £22,400. The viaduct of Chaumont, on the Eastern line, cost £282,085; that of Mirville, on the Western Railway, £92,025; and that of Brunoy, Lyons line, £60,400. The tunnels are said to be more than 300 in number and to exceed 37 leagues in total length. The longest tunnel in France is that of La Nerthe, on the Lyons and Mediterranean Railway, near Marseilles, which cost £420,000; that of the Credo, between Lyons and Geneva, cost £260,000. The total cost of the whole of the viaducts, bridges, and tunnels on the French lines is given at £17,307,278. The new park of the Buttes Chaumont, mentioned in the *Journal* of the 4th inst., is proceeding rapidly towards completion. It is said that a million and a-half of trees and shrubs will be required for its plantation. In the same neighbourhood will be the new reservoirs for the supply of the higher parts of the city with water, and the new cattle market and general abattoirs. There are said to be 50,000 men, 6,000 horses, 20 locomotives, and 500 waggons now employed on these various undertakings. An important work, and one that has been long required, is now going on between the Rue Richelieu and the Rue St. Honoré, namely, the formation of a square in front of the Théâtre Français, three of the most miserable streets in Paris, the Rue du Rempart, the Rue Jeannisson, and the Rue Fontaine Molière, as well as a number of wretched houses in the Rue St. Honoré and the Rue Richelieu, will be wholly or partially swept away by this improvement. The Rue du Rempart stands on the site of one of the ancient ramparts of the city in front of which Joan of Arc was wounded in the thigh when besieging Paris. Two large new churches, one on the Boulevard Malesherbes, and the other at the end of the Chaussée d'Antin, are rapidly approaching completion, and another church is about to be commenced on the south side of the Seine, to be called Notre Dame des Champs. The cost of the last named is estimated at £180,000. Estimates are pro-

verbially elastic in France as well as elsewhere, and it is whispered that the new opera house, which was to cost about a million sterling, will absorb more than double, some say three times, that sum.

RAILWAY PASSENGER SIGNALS.—The French Minister of Commerce and Public Works recently issued a circular to the directors of all the railways in France on the subject of establishing signals for the security of travellers on railways, and it is said that, from the commencement of the coming year, all the carriages of every passenger train will be placed in communication with each other, and, consequently, with the conductors of the train. It is also said that mixed trains, to carry merchandise as well as travellers at reduced fares, are in contemplation.

CONSUMPTION OF RABBITS.—It is stated in a work of importance, the *Encyclopédie Pratique de l'Agriculture*, that the number of rabbits sold to the markets of Paris, which in 1845 only amounted to 177,000 heads, had risen in 1863 to two millions. Taking the consumption of Paris, according to the established rule, at one-thirtieth of that of the whole of France, the number of rabbits consumed must be set down at something like fifty-seven millions per annum. Official documents fix the average price of rabbits at rather more than two francs per head, so that the total value must be above four and a half millions sterling per annum, and that of the skins is set down at another quarter of a million.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following information, relating to the state of Musical Education in Italy, has been received through Her Majesty's Secretary of State for Foreign Affairs:—

ROYAL MUSICAL INSTITUTE OF FLORENCE.

The following is a translation of an account of this institution kindly furnished by its President:—

The foundation of the Royal Musical Institute of Florence is recent. It was set on foot on the 15th March, 1860, and at the beginning of the year 1862 it was opened for public instruction. The Royal Institute is an establishment for public and gratuitous instruction in music. There are schools both for the rudiments of music and for musical reading, for solfeggio, for solo and part-singing, for keyed, stringed, and wind instruments; lastly, there are schools for thorough bass, for counterpoint, and for composition, and a school of aesthetics and musical history. Students of both sexes have thus an opportunity of obtaining in this Institute a complete musical education in every branch of the art; besides which, for the more advanced pupils, there are added periodical exercises in orchestral music, both instrumental and vocal.

The pupils do not reside in the Institution, but live in their own houses, and come to the Institution only to receive instruction in the different schools, and to take part in the musical classes. The admission of pupils, and their removal from one class to another, depends on examination; and, previous to the grant of the diplomas, the pupils who have finished their course are subjected to a strict examination.

The Institute is under the direction and government of its President, assisted by three professors, who form what is called a Council of Management.

The Institute possesses a musical library, composed of selected music, and books relating to musical literature.

The Academy is composed of resident, corresponding, and honorary members.

The Examiners are chosen from the resident members of the Academy, as are also the three members of the Council of management; these latter are elected triennially.

The number of pupils is not limited, being in practice regulated by the applications for admission, the result of examinations, and the means available for imparting

instruction. According to average experience, the number may be calculated at 220 pupils, one-third females and one-third males. Detailed particulars relating to the courses are given in the rules below.

The Institute has no endowment or property of its own, nor does it receive any payment from the pupils, who are gratuitously instructed. It is maintained by a grant from the state. The expenditure amounts annually to 40,694-70 lire,* of which 13,672-50 lire go to pay the management exclusive of the president and director, whose office is gratuitous, and the remaining 27,022-20 lire are for the instruction. The grant for apparatus is regulated by what is required; the average has been 14,300 lire. In this is not reckoned the rent of the place where the Institute is held, this being state property.

The following are the rules of the Royal Musical Institute at Florence:—

CHAPTER I.

The Institute is established to teach, singly and collectively, all the pupils of the Institute. It is intended that it should be opened periodically to all musical composers; that it should maintain a library of music for the use of the public, especially artists; that it should grant rewards to deserving artists; that the best works of modern and ancient masters should be performed there; that it should comprise a section for administration and direction; also one for instruction; and a musical academy.

At the head of the Institution is a president, a secretary, and a committee formed from the academy. There are sub-officers and others appointed by the president, and under the orders of the secretary, for the service of the Institute.

The musical academy is composed of resident and non-resident academicians, as well as a class of honorary academicians.

The Institution is in all respects a government one. It provides the musical service of the State on all public occasions, sacred and secular.

CHAPTER II.

The president has power over all the departments of his Institution. His office is permanent, but unpaid.

Section 2.

The secretary is responsible, under the president, for the financial administration. He receives the reports of the general conduct of the schools, and sees that the librarian and musical secretary perform their duties.

Section 3.—The Council.

The council is composed of three resident academi-

* Italian lire.

cians, appointed by the Minister of Public Instruction from amongst those who are not instructors in the academy. Their power is only corporate; they are elected triennially. There are also three supplementary councillors, in case of illness. The council is the judge in all examinations for admissions, &c. They receive an annual stipend.

CHAPTER III.—ON INSTRUCTION.

Section 1.—Schools or Classes.

1. History of music and æsthetics as applied to music. This class has a master with the title of professor.
 2. Harmony, counterpoint, and composition. A master with an assistant.
 3. Accompaniment from a figured bass and from score. Has a master.
 4. Singing, vocalisation, theatrical instruction, elocution, and deportment. Has a master and assistants when necessary.
 5. Elementary instruction, reading music, and solfeggio. The pupils are instructed from the first principles to the practice of solfeggio. A master and assistants.
 6. Organ, to enable the pupils to accompany the singing from notes. A master.
 7. Pianoforte, for professional pianists. A master.
 8. Secondary pianoforte, to enable singers to accompany themselves.
 9. Violin and viola.
 10. Violoncello.
 11. Double bass. In this class the scholars are taught from the groundwork of their respective instruments up to the perfect execution for an orchestra or a quartet.
 12. For wind instruments of wood.
 13. For ditto of brass.
- In these two classes the pupils are taught from the rudiments up to perfect orchestral execution.
21. A choral school is attached to the Institute, where the people can be instructed in choral singing. It does not form an integral part of the institution, nor is it a necessary step to the other schools. The instruction is gratuitous in this as in the other schools.
 23. The instruction in both schools is gratuitous.

Section 2.—Of Masters.

24. The masters and sub-masters are all appointed by Government, on the recommendation of the president.
25. The masters are responsible for the good regulation of the classes to which they are attached, the arrangements of which have been settled by them with the president.
27. The masters and sub-masters must assist at the examination of their pupils.
28. The sub-masters and the assistants are chosen by the president from amongst the better pupils; their post is gratuitous, but if they have held it for a year they are usually paid something.

Section 3.—Of the Pupils.

29. The conditions on which the pupils are admitted are—Morality, good health, and natural aptitude. The age varies according to the nature of the instruction sought, but is never under nine years. Full knowledge of reading and writing and the elements of arithmetic are necessary. Special conditions for admission to each school are laid down in general rules. The pupils are admitted provisionally, and if they pass the examination are drafted into the Institute.

31. Fitness to pass from one class to another, or from one school to a superior one, is determined by the examination called "passaggio." After two failures a pupil is dismissed from the Academy.

32. To have the right to call themselves pupils of the Institute, it is necessary, at the completion of the studies, for the pupils to go through a final examination for a license: if this is well passed they are declared "Accredited Pupils of the Institute," and obtain their diploma. This gives them a preference, *ceteris paribus*, over others in competitions for any public employment.

33. The pupils must behave with respect both to their colleagues and their masters, to whom they must pay implicit obedience, and conform to all the rules of the establishment.

34. Flagrant and repeated faults amongst the pupils are punished by expulsion on the sentence of the president.

Section 4.

35. During the scholastic year such of the pupils as are considered competent practice concerted music. This practice is independent of the usual classes, and is as follows:—For bowed instruments and for quartett practice, under the direction of the violin master; for wind instrument, and for the execution of good harmony, under the alternate supervision of the masters of these schools; for the school of singing in concert with or without full orchestral accompaniment.

36. Public concerts by the pupils are given at stated periods and at the end of the academical year.

ROYAL CONSERVATOIRE OF MUSIC, MILAN.

The Vice-President writes as follows:—

In answer to your letter I send you the following notices, which I hope will be a complete reply to the dispatch of the Minister, dated 16th of February, 1865.

The Royal Conservatoire of Music at Milan is wholly maintained by the State.

The Conservatoire gives a complete musical education, and a fair literary education. The musical instruction is directed by 29 professors and by about 30 teachers selected from amongst the best pupils of both sexes. In the literary branch there are seven professors. There are two other professors, one of deportment, pantomime, and ballet, the other for drill. There are, besides, a librarian and copyist, a tuner of the piano, a cashier and accountant, two inspectors, a secretary, seven inspectors for the pupils, four servants, a carpenter and decorator, a messenger, two porters. These persons (except the teachers of both sexes, who receive no payment for their services) cost the Government yearly 78,600 lire.

The Conservatoire instructs annually about 240 pupils of both sexes.

Each year the Conservatoire turns out from 12 to 15 finished pupils of both sexes.

To the pupils of both sexes who distinguished themselves the most at the yearly examinations is granted from year to year a monthly pension, arising from an endowment of 12,720 lire.

For all the other requirements of the establishment the State assigns 19,868·90 lire annually.

The fee which the pupils pay in each year is also 4,000 lire.

To this letter is added a copy of the rules of the Conservatoire, from which a more detailed account may be obtained, and to which is added statistics for the year 1862.

ROYAL COLLEGE OF MUSIC, NAPLES.

The Royal Neapolitan College of Music is composed of 100 pupils boarders at free cost (besides those who pay) and of the gratuitous day school with 120 scholars. At the holidays of the free boarders the free day pupils have the right to compete at the examinations with those who pay, and the director of music and four professors of composition and part-singing, and four examiners chosen by the governor of the college, together with the said director, are the judges. The 100 pupils are divided into fifteen different classes, according to the following proportion:—

Class.	Pupils
1. Composition, counterpoint, part-singing, and pianoforte.....	16
2. Singing.....	12
3. Violin	12
4. Viola.....	6

Class.	Pupils.
5. Flute	4
6. Fife	1
7. Hautbois	4
8. Clarinet	4
9. Fagotto.....	4
10. Horn.....	6
11. Trumpet	4
12. Trombone and ophicleide	4
13. English cornet.....	1
14. Violoncello	8
15. Double-bass	8

Two pupils, one from the violin class and one from the double-bass class, are instructed in the harp. The pupils who pay, have their choice of the classes, but not without considering in some degree the wants of the college.

The director of music has the superintendence of all that relates to the Art, and the musical instruction of the 100 free pupils and the instruction of those who pay is entrusted to 20 professors, divided into the following classes:—Two masters of counterpoint and composition, two masters of part-singing, two masters of singing, two masters of the pianoforte, two masters of the violin, two masters of the violoncello, one master of the double-bass, one master of the harp, one master of the clarinet, one master of the flute, one master of the oboe and English horn, one master of the horn, one master of the trumpet, trombone, and ophicleide.

Chamber practice is superintended by two other professors of music. The literary teaching of the pupils is entrusted to seven professors; one of ethics and logic; another of Italian literature and elocution; another of the French language; another of the Latin language, mythology, and universal history; another of the Italian language, geography, and history of their own country; another the elements of the Italian language; and the seventh, writing and arithmetic. Each year there are public trials to show the progress made by the pupils in their respective classes in composition, as well as in instrumental and vocal music; and also representations annually in the theatre of the Dramatic College, as samples for the School of Elocution; and in Passion week at the Church of St. Peter a Maiella the celebrated "Miserere" is sung by the resident as well as by the day pupils.

The musical lessons are given in three days of each week; on two other days there are vocal and instrumental concerts for the exercise of the pupils and the study of classical music in the library of the college. The musical instruction of the day pupils is entrusted to a fixed number of the resident pupils, with the title and rank of masters of the day school, and they are selected from the best scholars among the resident pupils. These masters give lessons three times a week; and at other times in the week the day scholars receive lessons from six professors of music with the title of inspectors. These are divided so one for singing, another for finger instruments, another for wind instruments, another for the violoncello and double bass, another for the violin, and the sixth for the conducting of concerts.

The revenue of the College is derived from two sources, one fixed and the other variable. The first consists of an annual payment from the state of 125,197 lire, of which 455-55 lire are paid directly from the Treasury to the masters and to others employed by the College; 1000 lire paid in compensation for the rents of the college taken by the State; and a supplemental grant of 23,741-64 lire. The variable revenue consists of about 448-08 lire arising from the rents of the College, given by private persons for the foundation of four musical scholarships, abolished at different times, and since amalgamated into the present College, the rents varying according to the letting of the town and country properties. The terms of paying pupils are—monthly 88-25 lire, and they find their own board, bed, and washing. The annual expenditure includes the maintenance of the

boarders (who all receive from the College, board, clothing, washing, instruments, music, medicine, &c.); the day schools, the management, masters, teachers, servants, and repairs, &c.

The supreme government and administration of the College, in every branch, is confided to three governors, nominated by Royal decree, who give their services without any emolument whatever.

EXAMINATION PAPERS, 1865.

(Continued from page 669.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

ITALIAN.

THREE HOURS ALLOWED.

Candidates for a First-class Certificate are required to translate into English prose the following extracts, and answer the grammatical questions attached to them:—

I.

Non come fiamma che per forza è spenta,
Ma che per se medesima si consume,
Se n' andò in pace l'anima contenta.
A guisa d'un soave e chiaro lume,
Cui nutrimento a poco a poco manca,
Tenendo al fin il suo usato costume.
Pallida no; ma più che neve bianca,
Che senza vento in un bel colle fiocchi,
Parea posar, come persona stanca.
Quasi un dolce dormir ne' suoi begli occhi,
Sendo lo spirito già da lei diviso,
Era quel che morir chiaman gli scioocchi.
Morte bella pareva nel suo bel viso.

(F. PETRARCA, Trionfo della Morte.)

1. *Spenta*: Give the infinitive and the first person preterite of this participle.
2. *Consume*: This is a poetical licence for the sake of the rhyme. How should this word end according to grammar?
3. *Se n' andò*: What is the difference between this expression and simply *andò*?
4. *Parea*: Write the whole of present and the preterite tense, indicative mood, of this verb.
5. *Sendo*: What is the more common form of this word?

II.

Sveno, del re de' Dani unico figlio,
Gloria e sostegno alla cadente etade,
Esser tra quei bramò che, il tuo consiglio
Seguendo, han cinto per Gesù le spade:
Nè timor di fatica, o di pericolo,
Nè vaghezza del regno, nè pietade
Del vecchio genitor, sì degno affetto
Intepidir nel generoso petto.
Lo spingeva un desio d'apprender l'arte
Della milizia faticosa e dura
Da te sì nobil mastro; e sentia in parte
Sdegno e vergogna di sua fama oscura,
Già di Rinaldo il nome in ogni parte
Con gloria udendo in verdi anni matura:
Ma più ch' altra cagione, il mosse il zelo
Non del terren, ma dell' onor del cielo.

(T. Tasso, La Gerusalemme.)

1. *Cinto*: Give the whole present and preterite tense, indicative mood, of this participle.
2. *Intepidir*: What part of the verb does this word stand for in this instance? How should it otherwise be written?
3. *Mosse*: Write the whole present tense, indicative mood, of this verb.

III.

Translate into Italian:—

After expressing his regret that I had not been able to

prolong my stay at Venice, my noble friend said, "At least, I think, you might spare a day or two to go with me to Arquà. I should like," he continued thoughtfully, "to visit that tomb with you;" then, breaking into his usual gay tone, "a pair of poetical pilgrims—eh, what say you?" That I should have declined this offer, and thus lost the opportunity of an excursion which would have been remembered as a bright dream through all my after-life, is a circumstance I never can think of without wonder and self-reproach. But the main design on which I had then set my mind of reaching Rome, and, if possible, Naples, within the limited period which circumstances allowed, rendered me far less alive than I ought to have been to the preciousness of the episode thus offered to me.

(T. Moore's Life of Lord Byron.)

IV.

IDIOMATIC PHRASES.

(To be translated into English, not literally, but by equivalent expressions.)

Stetti in forse.
Se mi venisse il destro.
Non so trovare il verso.
Egli parla d'ognuno.
Colgo quest' occasione.
Si fece avanti.
Parlatemi chiaro.
Cogliere il punto.
Che ve ne pare?
Se l'ebbe a male.

Candidates for a Second or Third-class Certificate are required to translate the following extract into English, and likewise to answer the grammatical questions given below:—

Proponendomi io di scrivere la storia delle cose succedute in Italia ai tempi nostri, non so quello, che gli uomini della presente età saran per dire di me. Conosciamo mancanti col finire del decimosesto secolo gli eccellenti Storici fiorentini, i quali soli forse fra gli Storici di tutti i tempi, e di tutte le nazioni scrissero senza studio di parti la verità, i tempi andarono sì fattamente peggiorandosi, e l'adulazione in guisa tale distendendosi, che il volere scrivere la storia con sincerità pare opera piuttosto incredibile, che maravigliosa. E non so perchè io m'oda dire tuttavia, che la storia è il lume del tempo, e che insegna bene il fatto loro ai popoli, ed ai principi: imperciocchè scritta secondo il costume, che prevalse, io non so quale altra cosa ella possa insegnare altrui, fuori che a dir le bugie; e qual buona guida nel malagevole cammino della nostra vita siano queste, ognun sel vede, stantochè i negozi umani con la realtà si governano: non con le chimerie. E già i più tra coloro, ai quali io appalesai questo mio pensiero, mi dissero apertamente, o ch'io non oserci, o ch'io non potrei, od all'ultimo ch'io non dovrei mandarlo ad esecuzione. Pure, pare a me, che se l'adulazione si cerca da una parte, che certamente si cerca, molto ancora più si offra dall'altra, e che più ancora siano da accagionarsi di viltà gli scrittori, che di rigore, o di ambizione i principi.

(G. BOTTA, Storia d'Italia.)

GRAMMATICAL QUESTIONS.

1. Decline, with the definite articles in both numbers, the nouns *pianeta*, *re*, *azione*, *moglie*, *studio*, *colpa*.
2. Give two or three examples of an Italian noun substantive, with its augmentative and diminutive terminations.
3. Write the possessive, demonstrative, and relative pronouns in both genders and numbers, showing which of those pronouns take the definite article and which do not. Explain *when* the article should be omitted before such pronouns as otherwise require it.
4. Write the persons given of the following verbs of the regular conjugations:—They believe (*credere*); we were working (*lavorare*); you went away (*partire*); thou

shalt feel (*sentire*); I would hope (*sperare*); let (*perdere*); speak thou (*favellare*); fly not thou (*liberare*); following (*seguire*).

READING INDUSTRIAL EXHIBITION.

This Exhibition was opened on Wednesday inst. The Bishop of Oxford opened the process prayer. The Old Hundredth Psalm was then members of the Reading Philharmonic Society.

The Maron afterwards briefly stated the circumstances under which the design of forming such an exhibition conceived and carried into effect, and invited it of Oxford to address the company.

The Bishop of Oxford said—Mr. Mayor, my ladies and gentlemen, I have very readily to the call made on me to address a few words to the interesting occasion of opening this exhibition believe it is calculated to be of real and abiding this town and the surrounding districts, in both feel so deep an interest; and if, therefore, it is in the slightest degree to help forward so good an undertaking I hold that I ought—as I use—that I ought to rejoice to take any part in its success. When I say that I believe this and exhibitions such as this, tend to advance interest of the town and neighbourhood in which are opened, I do so for several different reasons in the first place that such exhibitions are of use to a nation—I believe that the history of all scientific discoveries teaches us the same thing have been very rarely reached by men, how however profound, sitting down and reasoning conclusions to which at last they have come, contrary, that which, in almost every instance accident, because we have no better word to call that development of events the connecting link are so swift that they escape the power of tracing them—has mainly enabled us to arrive every one of our great discoveries in applying the use of man. I am sure every one of us member the wonderful illustration of the truth have just said in the discovery of that which enabled the locomotive engine to run upon wheels which have added so much to the prosperity in which we are now assembled. The great thing that came was to keep the fire burning which the water boiling which was to make the wheel Experiment after experiment was tried. The last the most practical ingenuity, set themselves to find how the thing was to be managed. Bellows we to blow the fire by which the wheels were to be their gyrations. They, however, failed to effect in view, and I think for twenty years we were at least improvement in elucidating the simple problem we were endeavouring to solve; when, purely as the constructor of one of these engines, to move of two chimneys, made the chimney which the smoke carry away the surplus steam, as problem was solved. A vacuum was created blast furnace for which man had been for years was in a single instant flashed upon the human mind. That I believe is the history of those throughout; and how does it apply? I think that when tinder is made there comes from the spark which, falling on that prepared tinder, sets to get the light you may be long watching for. Now, I maintain that such tinder is the mind prepared to a great extent by such exhibitions sent, and made ready for what we call the opportunity to seize at once on that which it has have understood if it had not undergone this preliminary teaching, and so by some sudden perception been able to grasp that which is of use and to give to waiting mankind that which it had endeavoured by a slower process to reach.

opinion, therefore, that if throughout our towns the observing faculty is educated in that way among the great mass of the producing classes, the best possible results to a nation such as ours, in a fiscal point of view, will be produced. I also maintain that it is a very great thing in an intellectual point of view. I know it has been lately stated that a great man, Adam Smith, was mistaken in saying that there was a tendency, in setting men to purely mechanical work, to destroy the courage of their minds for discovery, the elasticity of their minds for general application, and the powers of their mind for general usefulness. For my own part I entirely believe in the truth of the doctrine which Adam Smith has laid down. If you get a mechanic to perform certain perfunctory acts, what do you do? You first set to work his fingers and all the mechanical instruments with which God has furnished his body. These you so practise that he comes to perform that one particular act with unerring accuracy and marvellous rapidity without any intellectual effort. What is the result? You have succeeded in making his hands unfit for any other work, save that to which you have limited altogether his endeavours, so that he will be a bungler at any other work which you call upon him to perform; you dwarf his general powers by concentrating their action on one minute act. The body is the tabernacle of the mind, and that which you have done for the man's body by so limiting his exertions you do for his mind too. If you accustom him to regard himself as a mere producer of one particular thing—the maker, for instance, of the head of a pin, or the fixer of the head of a pin upon the shaft—no doubt you may have succeeded in making him wonderful at that, but you have done it at the expense of cramping, first the elasticity of the body, and next the elasticity of the mental powers with which Providence has endowed him. Now this is all Adam Smith advances. He does not say you may not guard your mechanic against it, by teaching him at once to do that which he must do for the good of society perfectly, at the same time remembering that he is not a machine for doing that alone, but a man endowed by God's good will with all the mysterious attributes of humanity, and that you may maintain that humanity quick and lively by other exertions at other times, so as at once to produce the mechanical subtlety you want, and yet the marvellous framework of humanity unentangled in him by the mere accident of that particular labour. Now, then, I say such institutions as this are intended and calculated to do that very thing. They lead a man who might otherwise be chained down to his own particular work to aspire beyond it, to show us that he is a wheel in the mighty machinery that is now acting everywhere around him in such a land as this. You give him an opportunity of combining with the highest skill in his own peculiar function the opportunity of enlarging his faculties to the greatness of the common estimate with which you bring him into contact. Well, then, intellectually, I say it is for this reason of the greatest moment; and allow me to say that it is even of more moment in a moral sense, for I believe there is a great moral interest at stake in such a development of humanity as this. If, indeed, it were to stop with this, if it were to be nothing more than informing men's understandings, the education of their tastes, or creating in them appetites for something intellectually higher than that which they otherwise would have, I for one should be false to my dearest convictions if I did not say that education taken alone would be a failure; but I do say that, taken in its proper place, it is a great instrument in the moral elevation of humanity. The first great army of injuries against which humanity has to contend in its moral development consists of those which rest as the basis of their force on the passions, and on the sensible faculties of the bodily form in which the spirit tabernacles—the desires of the appetite, the love of drink, the mere bodily excitement to which those things minister—these, as we all know, stand first in the way of the true intellectual and higher moral education of the

human family. Now, I believe, if you do give to your hardworking man opportunities like these of stirring up his intellectual faculties, teaching him—not by means of dry lectures, but by the practice of the day and by his own experience, that although he is an animal he is something vastly more than an animal; if you teach him that there is within him a divine spirit, a discerning taste, a mind reaching after many things, and that there is a pleasure in the gratification of those higher tastes which his Creator has endowed him with, which is greater than the pleasure, more enduring than the pleasure, more elevating than the pleasure which waits on any mere bodily excitement—I say that you have taken the very first step to raise that workman out of that which might have been to him corruption and a tomb. You have taught him to aspire to be indeed, in God's world, an intelligent creature, instead of being a mere enjoying animal. Those men who know as we do, that Christianity waits ever present to impregnate the prepared soil with the blessed seed of a yet higher teaching and of an eternal truth, must look upon such intellectual excitements as this as upon the teeth of the plough when it breaks up the hard ground, not that it can, like the sowing of the seed, yield the golden harvest, but that the breaking up of the ground must under ordinary circumstances as a rule be the preparation for sowing that higher seed which will be the prelude of the blessings of the intellectual harvest. Therefore it is that I believe that such exhibitions as this which we are opening this day are both intellectually and morally of great good to the people. I see in them, too, many other elements of civilisation besides those upon which I have just ventured to touch. Everything which tends amongst us to break down in our own estimate of things the mere artificial distinctions of rank and place—and while they are preserved as God's appointment, and as essential, I believe, to the happiness of all prevents their so usurping all attention, and filling all eyes, that in the common estimate of men labour is considered as something degrading, and that people who have least of this world's good are in a measure lower than those who have the most—everything which guards against this evil I think such institutions as this may greatly help you to attain. For, after all, what are the greatest gifts that God gives? Are they not the natural gifts that God gives to any one of us? Are they not that marvellous faculty of genius that operates we know not how, but which does part one man from another, and is greater than any inheritance of outside things, which after all are little more than the dress he wears for a season, and casts off for ever in his hearse? Is not this imperishable gift of genius, the kindling of the fire which comes from the fire that is eternal, and which burns in the mind of the poorest amongst us, a gift greater than any of the external circumstances which belong not, indeed, to us, but are, as it were, the accidents—the playclothes of the actors on the stage of life, while each plays his little part in the sight of man. I believe such institutions as this have a great tendency to develop the gift of genius. A man may have within him some of the great gifts of God, yet, unless there is something that brings out to his own knowledge first, and then to the knowledge of those around him, that they exist within him, they may sleep even through that man's life. We all remember, for instance, how a man has been remarkable for some great gift of genius; has, through his childhood, been struggling under difficulties because his schoolmaster could not understand that genius, and who, because God had not given him the attribute of learning without infinite toil and trouble ordinary matters, could not suppose that he was developing his genius, perhaps in portraying his somewhat tyrannical schoolmaster on the under side of some well-concealed deak under which he thought he would never look. It is perfectly certain that unless there is some mode of developing genius in the workaday world of ours, in many cases it never will become developed. The general spread of a certain kind of educa-

tion, unless we watch it, while it has a tendency to raise all to one practical level, has also a tendency to sink all to one practical level. It ignores altogether the recognition of the gift of genius; it stamps a perpetual repetition of the same coin with infallible accuracy from the same die, but it never can create genius. It never can give to the world men who are capable of shaping a statue such as Canova could chisel or such as Michael Angelo could design. Therefore with education such as it is now we more than ever want things which shall be, as it were, suggestive to minds in which genius may be slumbering, to call it into action and enable it to assert itself. A friend of mine the other day, travelling abroad, went to examine a famous school, and was shown over the whole of it. Its workings having been explained to him with the greatest minuteness, he found that provision was made for everything he could conceive; but there was nowhere, as far as he could see, the least allowance made for the exercise of any individual power, or any individual gift, in any one of the scholars, and he was turning away from the establishment with a very sad heart when his eye accidentally alighted on a slate put carefully aside, on which was an admirably-drawn picture of two schoolboys making horrible faces at one another. After having examined it he put it aside, exclaiming, "Thank God, this is a good school, after all." Now, I do not want these hideous faces; but I want beautiful repetitions of the finer works of nature, to act as suggestive instances, awakening in men's minds their higher energies, and reminding them that they possess powers which they never before suspected, so that they may be induced to imitate that painter who in the days of his youth said, on looking at one of the masterpieces of art, "I, too, am a painter." I believe that by spreading these works throughout the country we call forth the faculties of men by familiarising them with the highest works of genius; and I think we can see in it another good—it reveals man to man. A master who has under him in his manufactory one of these individuals in whom sleeps the seeds of genius, discovers through the medium of such an exhibition as this the hidden powers of humanity in his workman, and feels that a work has been done which he himself could never have compassed; immediately he looks upon this brother as indeed a brother, in a manner which he had never before appreciated, he sees in him, instead of a mere performer of some drudgery or some work for which he is to be paid, one in whom God has sown the seed of true humanity, and he begins to honour that humanity, so that the servant receives his due from his master, and the master himself is raised in the scale of creation by his acknowledgment of the gifts of Heaven in the man whom he employs. For all these reasons, then, believing that the welfare of this nation is indeed helped on by such institutions as these—believing that they tend intellectually to benefit those who produce for them and those who study in them—believing that they have also a moral effect on those connected with them—believing that the kindly interchange of human affections and mutual self-respect are encouraged and increased by such exhibitions, I do heartily rejoice that this one has been opened among us. I rejoice first for those whom I see in that gallery opposite, who have contributed such striking works of industry to this exhibition. This is to them, I think, a day of lawful triumph—a day of real intellectual rejoicing. They come and see the work which they have been enabled to accomplish; they see it in its beauty, and they look—as I know men often look—with wonder at the work of their own hands, as they ask themselves how they were ever able to conceive that which they have executed. I rejoice in this event too for the sake of the great mass of this district. I rejoice in it further because it has afforded an opportunity to those upon whom God has bestowed wealth and station of contributing to the good of their neighbours. I rejoice to find the names, the honoured names, of almost all those who occupy the highest position in this county vying with each other in this true work of common kindness and use-

fulness. I rejoice—and I know that this whole meeting will sympathise with me in that joy—that that count has been approved, and that the example of it has been set by our beloved Queen. In this Royal county we rejoice in this Royal countenance. We rejoice in it, not as those who merely wait upon the great, but as those who see in the ancient throne of this ancient kingdom the imperiousness of its own greatness, and the instrument whereby God has preserved its liberties. I for one feel that our gracious Queen, in making these loans to this exhibition, was not merely fulfilling the dictates of a drier, colder, and harder judgment, but that her affectionate ministrations too to the same result. Does any one in this place who has known the natural touch of grief think that upon this occasion she forgot to whom Britain owed its first Great Exhibition—whose thoughtful mind forecast those benefits of which I have feebly spoken—whose unfailing energy carried that first attempt to a successful issue—whose loving care for his wife's people made him see anything by which he could benefit them in any way? No: she who was even then, piously, in memory of the dead, unveiling that memorial statue, felt that she was ministering to the like remembrance when she lent the treasures of Windsor Castle to this industrial exhibition at Reading. She felt that she was doing that which would have done, and which he would have her do; and doubtless, with the joy of benefiting you was associated the remembrance, the blessed remembrance, of that great and good prince—for, alas! it is now no flattery to speak of him as he was; and I may venture to say, as one who knew him with even an unusual intimacy, that he was one whom I never found surpassed in intellectual capacity—whose mind seemed to me to be capable of being applied with equal facility to every kind of study—who knew nothing that he had learned—who classified in his philosophical and capacious mind all the multitude of things which his eager thirst for knowledge unsparingly supplied to him, and who ruled all under the most unobtrusive of what he believed to be his duty, consulting from morning till night, as best he could, the interests of the people by whose throne he had been, by God's providence placed. Yes, it is to me a joy to think that the noble lady in ministering to our benefit could honour that immortal memory; and following her, as I have said, the possessors of treasures in this county have lent them freely to us. It is for you, my friends, now to make the best use of them, not to gaze on them with that empty stare which conveys little to the mind; but, wherever may be your special sphere, to study the models before you here in that sphere, to ask yourselves: such a work is good; what is the reason that it is so; wherein should you have failed if you had attempted to do the like;—and so patiently and humbly to take your model that which is here presented to you, and in all this to do your duty in the state of life to which God has called you—to develop more perfectly the instruments of service with which he has endowed you, and the midst of a redeemed world to work as renewed and educating yourselves for service here, and for the blessed visions of the Almighty hereafter.

The "Hallelujah Chorus" was here sung by a volunteer choir. The Earl of ARBINGDON then moved a vote of thanks to the Bishop of OXFORD for his attendance upon that occasion and for the delivery of his impressive address. Colonel LORD LINDSAY seconded the motion which was at once carried by acclamation. The Bishop of OXFORD acknowledged the compliment, and then, at the request of the MAYOR, declared the exhibition to be open.

A vote of thanks to the MAYOR for his services in promoting the exhibition was proposed by Mr. BENTON, and seconded by Sir F. GOLDSMID.

The MAYOR returned thanks for the honour which has thus been conferred upon him; the "National Anthem" was sung; and the ceremony of the opening of the exhibition was brought to a conclusion.

BRISTOL WORKING MEN'S INDUSTRIAL EXHIBITION.

On Tuesday, the 19th instant, the Working Men's Industrial Exhibition, in the Great Drill-hall of the 1st Gloucestershire (Bristol) Volunteer Corps, in connection with Bristol, Bath, the West of England counties, and South Wales, was opened with much ceremony by the mayor and civic authorities, the bishop, dean, and clergy, and numbers of the resident and neighbouring gentry attending. The Exhibition comprises specimens of handicraft in almost every department of industry, numerous specimens of sculpture and carving, models of steam engines and other machinery, specimens of needlework, and there is in connection with it a gallery of pictures. It had been intended by Lord Palmerston to open it, but his lordship's indisposition prevented his doing so, and Mr. Gladstone and Lord Stanley, who were invited at a late hour to accept the vacant honour, being both pre-engaged, the distinction was proffered to and accepted by the chief magistrate of Bristol, Mr. W. Naish.

Prior to the ceremony there was a procession of the different trades and benefit societies, which at the council house was formed by the Mayor, in state, the high sheriff, Mr. Cruger Miles, and other dignitaries.

As soon as the procession entered the building the bands of the volunteer corps conjoined struck up the National Anthem.

The Mayor then addressed the assembly, and formally opened the Exhibition. The Bishop of Gloucester and Bristol then offered up an appropriate prayer, after which the choir sang Handel's "Hallelujah" chorus from the *Messiah*, and the proceedings closed with singing the National Anthem.

COLONISATION; ITS ASPECTS AND RESULTS.

By WILLIAM STONE, Esq.

(Continued from page 628.)

LITERATURE AND SCIENCE.

The important influence which our colonies exert upon the production and sale of books will be evident to every one devoting a short time to the examination of the matter from whichever point of view we regard it, whether as the scene of their subject, or as the market for their sale.

Writers of some of our most interesting books of travels and important scientific works on botany, geology, and natural history, have found their subjects in our colonies, and writers of fiction and poetry have laid some of their most exciting scenes in the adventurous period of colonial discovery, or in the piquant treatment of circumstances suggested by events in their history. Not only have some writers and men of science been largely influenced and benefited by colonial subjects, but able men who have received their scientific training in England are to be found permanently located in every colony, and either by original treatises published on the spot, or by their valuable contributions to English literary and scientific works, greatly promote the sum of human knowledge. Notice must also be made of the meteorological, astronomical, and magnetic observations, which are constantly being carried on in so many of our colonies, essentially contributing to advance our acquaintance with the phenomena of nature.

Some interesting points of practical science in connection with our dependencies and colonial possessions, and to which we can only make the briefest allusion, have reference to the attempts at acclimatization and the introduction of various animals and vegetables into new regions. Millions of sheep, goats, cattle, pigs, horses, and poultry overrun the continent of Australia and the island of New Zealand, in the latter of which no four-footed animal except a rat was previously known to exist.

One of the most curious and exciting chapters of adventures is the tale of Governor Bligh, whose crew,

while prosecuting the purpose of introducing the bread fruit tree from Tahiti into the West Indies, mutinied, and he himself with eighteen others were cast adrift in an open boat, 23 ft. long, 6 ft. 9 in. wide, 2 ft. 9 in. deep, and reached Timor forty-one days after leaving the ship, having run 3,618 miles, and notwithstanding their extreme distress, no one perished in the voyage. The mutineers of the *Bounty* subsequently formed that curious, anomalous and peculiar community known as the Pitcairn Islanders, who have been recently removed to Norfolk Island, owing to the increase of their numbers outgrowing the capacity of the former place.

The successful exertions of Mr. Ledger to convey the alpaca from South America to New Holland, and the praiseworthy attempts to render us independent of South America for quinine, by the cultivation of the cinchona plant in India, deserve a more extended notice than our space will allow of being given. And we may further add that in many of the colonies zealous exertions are being made to encourage and protect our English game and other birds, and while we are discussing the propriety of abolishing or modifying our game laws, they fear that unless some protection is afforded the game will be almost entirely shot off, as is the case in the more settled districts of the United States of America, laying some stress on the fact that while in some countries game, as in the pleasant land of France, is scarce or unobtainable, the English preservers of game secure an abundance of sport but not a monopoly of the produce, which is sent to market, and thus all persons are enabled more or less to secure the gratification of partaking of game food at a not immoderate price, certainly at a much less cost than the actual preservers incur for what they consume. These observations are susceptible of numerous other illustrations, from both the animal and vegetable kingdoms, if space permitted, thus we have the sustaining power of the world greatly increased by this largely-extended cultivation of food, man's health improved by the enlargement of his medical resources, and even luxuries rendered available and abundant.

While some of the sons of colonists receive a liberal education from men of learning who have departed from English shores, others resort to the English universities and colleges of law and medicine to prosecute their studies, and return with English honours to take a high position amongst their fellow-colonists.

Some of the colonies have successfully started literary works of humour, as the *Melbourne Punch*, many of the articles in which would not at all disgrace its Fleet-street contemporary, as, for instance, the pieces entitled "A Colonial Christmas Ode," by a Saturnine New Chum, and "Enoch Arden boiled down," which space and the purpose of these remarks will not allow of being introduced.

English books are not more eagerly sought for by the most rapacious home reader, than by colonists spread far and wide over the whole earth, who, having leisure and sufficient means, annually obtain from the English market immense numbers of all kinds of books, not only of light and cheap literature, but also the more expensive works of reference. In my own case I may say that some of the most pleasant acquaintances with English standard works I ever made, were by my solitary readings in a New Zealand hut, with no civilised companion than the thoughtful dead.

A touching illustration of the tenacity with which, under the most unlikely and painful circumstances, readers will cling to an old and pet volume, we have in the fact that one of the few rescued remains of the Franklin expedition was a torn fragment of the "Vicar of Wakefield." How the genial soul of Goldsmith would have gladdened at the thought that his simple pathetic tale would solace the last sorrows of such heroes. Re-acting upon our national writers is this influence of a world-wide audience. Magazines, newspapers, periodicals of all kinds, speed on their way by sail and steam to every nook of the world; from the depths of the backwoods of Canada to the most

recessed sheep station in Australia, open eyes, minds, and hears lovingly wait the arrival of the mail bringing from home its choicest words of mirth and wisdom.

Fine Arts.

FOREIGN EXHIBITIONS.—The section of Fine Arts of the Cercle Artistique, Littéraire, et Scientifique, of Antwerp announces the foundation of an annual exhibition of the works of Belgian and foreign artists. The exhibition is to take place in a gallery erected for such purposes in the establishment of the Cercle itself, and the direction is entrusted to a committee composed exclusively of artists, amongst whom are Baron H. Leys, Comte Dubois, and MM. Bource, Dauriac, de Keyser, de Brackleer, Lamorinière, Tadema, Van Hove, and Verlat. A lottery is to take place in connection with the exhibition, and the prizes are to be purchased from the works of artists whose names are to be drawn by lot from the list of members, and of associates paying ten francs a year to the association. The first exhibition is to take place this year, but the date is not yet announced.—Exhibitions of the products of industry and works of art are to take place next year, almost simultaneously, at Copenhagen and Stockholm. A commission, with Prince Oscar of Sweden at its head, decided some time since that such an exhibition of Scandinavian productions should be opened at Stockholm on the 15th of June; a short time afterwards a commission was formed at Copenhagen, under the presidency of the Prince Royal of Denmark, and it decided on a like exhibition, to be opened on the 1st of the same month. The artists and manufactures of Copenhagen, naturally considering the coincidence of the two exhibitions unfortunate, suggested the adjournment of the latter to the year 1868. A correspondence was opened between the two commissions on the subject, but no very satisfactory result has been arrived at. The Copenhagen exhibition is to be opened on the 1st of May, and closed 1st of July, while that of Stockholm is to open on the 15th of June, as originally proposed, but Danish contributions are to be received until the 15th of July, and the reports of the jurors are to be deferred, in order that what is sent from Denmark may be included.

Manufactures.

CHINA GRASS.—The experiments which have been made in France with this fibre, and which have been duly recorded in this *Journal*, are being followed up by the necessary steps to carry the matter into practical operation. A company is announced as having been formed for the preparation, combing, and cottonisation of China grass. The capital of the company is 3,000,000 francs, to be raised in shares of 500 francs each; and amongst the ten members of the Administrative Council are the Maire of Rouen, the President of the Tribunal of Commerce of that place, four other members of the Chamber of Commerce of the City, of the General Council of the Department, or of both, and three are members of the Administration of the Bank of France. The composition of the new company proves that the expectations raised respecting the economic application of this well-known but little-used fibre are entertained by practical men.

ALANTHUS SILK-WORM.—The long continuance of warm weather has greatly favoured the experiments made in the rearing of the *Bombyx cynthia*. In the enclosure within the Jardin d'Acclimatation, in the Bois de Boulogne, may be seen at the present moment a large number of these worms of the third generation of this season, feeding in the open air on the alanthus, or spinning their cocoons. The creatures are of great size, and seem to be in perfectly healthy condition. The cocoons

are generally formed at the extreme end of the branches, or rather of the leaves, for the alanthus has long compound leaves, with many leaflets, like the ash, where no bird, however light, could rest and make a meal of the occupant, and the worms take the curious precaution, before commencing the cocoon, to attach several threads of their web to the leaf-stalk as high as the third or fourth leaflet, so that if that on which the cocoon is fixed was to be broken from its stalk, it would still be held pendant by these stay-threads.

Commerce.

SUPPLY OF SUGAR.—The following is from Messrs. William Connal and Co.'s circular:—"In forecasting the future of the market for the next two months, there is every probability that the imports will fall far short of those of 1864, when the burden of supply was thrown on the autumn, instead of being distributed, as usual, over the spring and summer; and though a comparison may be more fairly made with the supply for the corresponding period of 1863, it may be materially modified by the revival which has now taken place in the American demand, and which already has raised prices in Cuba about 2s. above those ruling here. The import of 1864 for September and October, amounting to above 110,000 tons, exceeded that of 1863 by 63,000 tons, so that, with our increasing consumption, the stocks on 31st October in the United Kingdom will show a material decrease. Present duty paid prices are about 1s. 6d. lower than in 1863, and 6s. lower than in 1864. The only element to check the market is the yield of the Continental beet-root crop, which in the meantime is not estimated as likely to be greater than that of last year."

THE COFFEE TRADE.—The gradual decrease in the consumption of coffee, usually attributed to the increased consumption of tea, appears to be a more serious matter for the coffee-growers, whose whole prosperity depends upon this particular branch of commerce. The Planters' Association in Ceylon have forwarded a petition to the Chancellor of the Exchequer, that of late years the consumption of coffee has been steadily declining, the deliveries for 1864 showing a falling off of more than 12,000 cwt., as compared with 1863, and of nearly 28,000 cwt. as compared with 1862, while the consumption of tea, on the other hand, has been rapidly on the rise, the deliveries for 1864 showing an increase of about 8,500,000 lbs. over 1863, and nearly 10,000,000 lbs. over 1862. The petitioners urge that this contrast is owing in great measure to the reduction of 6d. per lb. in the duty on tea effected in 1863. They fear that the late further reduction of 6d. per lb. will render the contrast even more striking, and their fears are justified by the fact that, in the first five months of this year 1865, the deliveries of coffee for home consumption were upwards of 20,000 cwt. less than in the corresponding five months of last year. They point out that, whereas the present duty on tea of 6d. per lb. may be taken as 17 per cent. of the value of the produce, the duty on coffee at 3d. per lb. is above 35 per cent. of its value, and finally, to prevent a further aggravation of these results, and to place coffee in a position to compete on even terms in the home market with tea, the petitioners "pray that in the coming year a reduction may be proposed in the duty on coffee proportionate to that already carried with regard to tea." Messrs. Travers observe that "it is not impossible after all that the loss of trade in the home market may be more than made up by an increased demand on the Continent. At Hamburg, the greatest coffee market in Europe, from which the supplies for the interior of Germany and the countries to the north are derived, the demand is constantly increasing, and the prices have been rising for some years past. This, we believe, is the case all over the Continent. To meet this increased demand

the cultivation is everywhere spreading, and especially in our possessions in India and Ceylon. In some minor places, however, as, for instance, in Borneo and Réunion, the cultivation of the plant has been much neglected, whilst in other parts its introduction is looked forward to with sanguine expectation as the source of a great export trade. This is so more especially in Feejee, where there are at present 20,000 coffee trees in a most flourishing condition, two-thirds of which will bear fruit next year."

Colonies.

THE MURRAY RIVER DUTIES.—It appears that the New South Wales and Victorian Governments have failed to agree respecting the collection of these duties, and the former Government applied to that of North Australia again to undertake their collection, and which they have consented to do.

LAND IN SOUTH AUSTRALIA.—The area of country and suburban land sold during the year 1864 amounted to 225,171 acres, or 65,379 acres more than in 1863, bringing up the total area of purchased land to 2,893,814 acres, or 19.54 acres per head of the estimated population. At the commencement of 1864 the average for each individual was 19 acres. Two-thirds of the sold land is returned as being in the hands of freeholders maintaining the same proportion as last year. Twenty per cent. of the purchased land is under cultivation. Notwithstanding the large purchases of land for grazing purposes, it is important to note that the ratio of cultivated to untitled land is maintained as 1 to 4, the same rate as at the last twelve months. In comparison with the respective populations there is five times more land under tillage in South Australia than in the adjoining provinces, there being 4 acres to every man, woman, and child in the province, or 12 acres for every male of 14 and upwards. Seeing that of this division of the population only one-sixth are engaged in agricultural pursuits, it follows that an 80-acre section can receive but little more than the continuous labour of one statute male throughout the year. A considerable increase appears in the extent of enclosed land, which now amounts to 3,499,098 acres, compared with 2,900,291 acres, an addition of 598,807 acres, chiefly attributable to the further enclosure of land for pastoral purposes, the fenced pastorage amounting to 1,911,323 acres, against 2,344,324 acres in 1864, an increase of one-fourth. Very large areas in the south-eastern district are enclosed with sheep-proof fences of a substantial kind, the aggregate enclosure in that district alone amounting to 1,730,614 acres. Three-fourths of this fencing encloses runs held under lease from the Crown; the whole extent of sold land in the district being 366,403 acres, only 16,593 acres of which are at present under cultivation. One-fourth of the sheep in the colony are pastured within the limits of this portion of the province. The total area of land under cultivation amounts to 587,775 acres, against 555,968 acres in the previous season.

Publications Issued.

ANNUAIRE ENCYCLOPEDIQUE. (*Paris*.) 4to. 1865.—A few years since, the directors of the "Encyclopedia of the Nineteenth Century" commenced the publication of an annual supplementary volume under the title above given, and it has grown to be a work of considerable importance. It includes almost all subjects, political, scientific, literary, artistic, and industrial, official returns and other information being worked in with opinions and arguments by eminent writers. Amongst the most prominent in the new volume are articles on wages, and their relation to the price of food in the present and past

times; on octroi duties, and the arguments in favour of their suppression; on the acclimatisation of Europeans in different latitudes; on asserted degeneracy of races; on the effect of consanguineous marriages; on industrial communities; on temperance societies; on religious dissent in Russia; and on the Rhenish provinces, the author of which advocates the French view of the question with daring energy. As a collection of general facts and a record of opinions in France, the annuaire in question is highly important.

Notes.

ORGANIC CHEMISTRY.—A chair of organic chemistry has just been established by Imperial decree in the College of France, and M. Marcellin Berthelot is appointed its first occupant. This is the first time that this important practical branch of scientific education has been introduced in the college course. M. Berthelot has recently made himself popularly known by a volume of synthetical lessons on the same subject, and his appointment is regarded as an advantage gained by the friends of positive as opposed to speculative science.

COPPER A CURE FOR CHOLERA.—Doctor V. Burg, of Paris, has given much attention to the preservative and curative action of copper in the case of cholera. He says that in the years 1832, 1849, and 1854, when the cholera committed sad ravages in France, the workmen who were in continual contact with copper always escaped the malady, that not one was known to be attacked even where neighbours and members of their own family were falling around. In support of this assertion Dr. Burg cites the evidence of Messieurs Calla, Chevalier, Sax, and thirty other manufacturers of articles of which copper forms a part. Dr. de Pietra Santa observed the same effect in the case of the boys in the reformatory prison of the Madelonnettes who were employed in making copper locks; and M. Péchalier and M. Saint Pierre, professors in the College of Montpellier, remarked the same fact in the case of workmen employed in the manufacture of verditer. Dr. Clever de Moldini is said to have saved the lives of many of the soldiers in garrison in Paris, by causing them to wear plates of copper next the skin, and administering a few drops of solution of salts of copper every morning and evening. In 1855 Dr. Raymond, who was with the artillery at Gallipoli and Varna, adopted the same practice with complete success. Dr. Burg attributes to copper a direct action, and says that rings or plates of the metal are very efficacious against cramps and other symptoms of cholera. He also gives those attacked, or threatened with cholera, considerable doses of salts of copper. In 1854 he carried invariably about him a diluted solution of sulphate of copper and administer it to his patients in doses of from two to ten drops in a little sugar and water, with one or two drops of laudanum, to prevent the stomach rejecting the copper. He believes copper to be with respect to cholera what quinine is with respect to fever, a sovereign remedy.

CHEMICAL EDUCATION IN FRANCE.—Chemistry is one of the sciences to which France has always paid great attention, and in none has she achieved higher renown or produced more brilliant illustrations. The names of Lavoisier, Gay-Lussac, Thénard, and others, have a world-wide reputation. At the present moment much is being done for the general extension of chemical knowledge as a portion of special education. The establishment of a chair of organic chemistry at the College of France has been lately recorded, whose doors are open to the public without any form whatever. So long as a seat remains unoccupied all the world is free to enter the lecture rooms of the establishment. Recently also a gratuitous school of practical chemistry has been created, by the joint endeavours of the famous chemist, M.

Chevreul, and his colleague, M. Frémy, at the Jardin des Plantes. This is the first instance in which a laboratory has been opened for gratuitous instruction in the practical part of the science. The Government has subscribed 10,000 francs towards the expenses of the school, which was at first supported entirely by voluntary efforts, and M. Mérier, a manufacturing chemist, has presented a like sum, the interest of which is to be applied exclusively to the current expenses of the laboratory. The new school numbers fifty or more regular pupils, and the professor, M. Frémy, now proposes to establish another laboratory to that now in existence, in order that the higher phases of the science may be pursued side by side with the educational branch; or, in other words, that young chemists may have the means of using the knowledge which they have gained in pursuing analysis and discovery. It is to this department that the donation of M. Mérier will be applied, in order that a certain number of young men, who exhibit special aptitude, may be relieved from the necessity of seeking employment yielding direct pecuniary benefit, and be able to give their undivided attention to purely scientific matters. There is little doubt but the liberality of M. Mérier will induce imitators, and if the means thus supplied should produce, or rather encourage, one or two eminent chemists only per annum, the object in view will be attained. Such scholarships will be sufficient to sustain young men of talent in their early researches, while they will in no way tend to undermine individual activity. They will supply stepping-stones, but not resting-places.

CONCRETE ARCHING.—The use of artificial stone and concretes in construction has been attempted in several forms, but generally in that of blocks previously shaped and afterwards applied like stones. In the extensive underground floors of a new barrack now erecting in Paris, the vaultings are being formed with what is called *Betons agglomérés*, the exact composition of which is kept secret by the inventor, M. Coignet. The walls are full thirteen feet apart, and the concrete is laid on timber centreings, and trodden and beaten down with great care. The vault and flooring thus formed is about two feet thick at the spring of the vaulting, but only about ten inches on the crown, and it is found sufficiently strong for all practical purposes. It has also this great advantage that the ceiling can at once be whitened and the floor laid with tiles or cement without further preparation. The process is said to be successful and economical.

Patents.

From Commissioners of Patents Journal, September 15th.

GRANTS OF PROVISIONAL PROTECTION.

Bank cheques, &c., prevention of forgery of—2101—J. G. & R. S. Dale.
Bearings, metal suitable for—2176—W. C. Cambridge.
Bed-quilts, &c., ornamenting the edges of—2253—R. Knowles and J. Lindley.
Boilers and furnaces—2291—E. and E. Green.
Bottles, securing corks in the necks of—2233—W. H. P. Gore.
Brushes—2236—G. Smith and C. Ritchie.
Carpets, &c., making and ornamenting of—2181—L. Clayton.
Carriages, &c., disconnecting horses from—2271—P. Marvaud.
Casks, &c., supplying carbonic acid gas to—2187—C. A. Watkins.
Caustic liquor or caustic lye, making of—2289—T. Nicholson.
Combination drill brace—2212—E. Davies and R. H. Tannton.
Cotton, spinning—2285—J. Pilkington.
Curved designs, sawing—2263—J. Elverson.
Electric Telegraph cables—2213—W. P. Piggott.
Engines, rotatory—2202—W. Graham, J. Broughton, and T. Cockhill.
Fabrics, dyeing and fixing colours in—2206—H. A. Bonneville.
Fustians, &c., cutting the terry or loops of—2251—J. Lealle.
Gas burners—2179—G. Bagnagatti.
Gold and silver, extracting and separating—2229—W. Crookes.
Hair, irons for curling—2283—L. Gachin.
Horse shoes—2197—J. Symmons.
Ladies' dresses, raising the skirts of—2207—H. A. Bonneville.
Land, implement for tilling—2235—S. and S. Gilbert.
Leggings, &c., fastening for—2124—F. J. Jones.
Life rafts and surf boats—2273—A. V. Newton.
Lights, &c., floating—2173—J. Moody.
Locks—2198—E. D. Hodgson.

Metallic pipes, &c., moulds for casting—2216—G. Robinson.
Ovens, &c., heating—2176—F. Thomas.
Paper, vegetable fibre for—1634—W. Daltour.
Petroleum and other oils, treatment of products obtained is new—2195—J. Fordred.
Petroleum, &c., receptacles for—2185—G. W. Howard.
Pockets, apparatus for ensuring safety of contents of—2220—J. Anderson and D. Durant.
Railway carriages, safety couplings for—2186—F. C. B. Robinson.
Railway chairs, fastenings, and sleepers—2182—H. H. Bates.
Railway ticket case—2239—M. Woodfield.
Railways, permanent way of—2183—W. Rogers.
Rope, &c., manufacture of—2225—T. Cope and W. Guest.
Saucepans, &c., lids or covers for—2249—J. Ward.
Sealing-wax, &c., vessels for melting—2281—W. Bunge.
Sewing machines—2287—R. A. Parks and G. Callaway.
Silicated alkaline inks, &c., production of—2267—H. Ellis.
Skates—2190—A. V. Newton.
Spirit meter—2193—J. F. Hearsey.
Spirits of turpentine, &c., obtaining—2247—W. E. Newton.
Steam boilers or generators—2189—W. E. Newton.
Steam hammers—2174—D. Davies.
Steam-heating apparatus—2255—A. V. Newton.
Stench trap and sink pipe protector—2220—W. H. Gumm.
Stockings—2177—F. Ayckbourn.
Submarine electric telegraph cables—2209—S. T. Jones.
Submarine telegraph cables—2267—W. Clark.
Sulphurous smokes and vapours, condensing and utilizing—2194—Guritt.
Tanning—2231—J. H. Johnson.
Tar, &c., for paint—2191—J. Moule.
Tubes, cast steel or other metallic—2241—W. H. Brown.
Tubes, well-sinking—2176—W. E. Newton.
Vans, &c., for transporting furniture—2192—F. Haselkine.
Veneers, &c., ornamenting—2279—T. T. Posnamby.
Vessels, propelling—2223—W. Clark.
Vibration of sliding windows, retaining and preventing—2241—Wrigley and M. B. Westhead.
Violet dye-stuffs—2194—J. A. Wanklyn.
Waist and other belts, elongating and contracting—2241—White and H. Chamberlain.
Water, supplying boilers with—2211—A. V. Newton.
Water, supplying measured quantities of—2190—R. G. Ratier.
Water, &c., meters for measuring—2289—C. Horley.
Wheels, removing axle-boxes from—2269—J. Drabble.
Wool, &c., combing—2222—J. and W. H. Bailey.

CANTOR LECTURES.

IN SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS." By DR. F. CRAIG CALVERT, F.R.S., F.C.S.

LECTURE I.

DELIVERED ON TUESDAY, THE 4TH OF APRIL, 1865.

the Discoveries in Chemistry applied to Arts and Manufactures.

In this lecture I intend to treat of chemistry applied to the arts, and more especially to some of the discoveries which have been made within the last two years. Many of these will appear to you to be incomplete, but if complete they would not be new, for seldom are discoveries effected at once. They are generally the result of many years' study, and of the thoughtful consideration of several men.

The first part of this lecture will have reference to some of the applications which the laws of light have received during the last few years; and it will, I hope, convince you of the necessity of every one engaged in the arts making himself acquainted with all the laws connected with the phenomena of light, to enable him to appreciate the discoveries which have been made, or to assist him in improving upon those which are already known, as they are constantly receiving the most valuable applications in the arts and manufactures. Thus, for example, M. Donné has applied the properties of light to ascertain the relative values of milks by the amount of cream they contain, and this he effects by an instrument which he calls the lactoscope. Dubosch Soleil has applied with great success one of the most complicated laws of light—viz., polarised light—to the commercial estimation of the various qualities of sugars. By this process the sugar refiner, or any other person interested in that product, is enabled to ascertain in half-an-hour exactly the amount of crystallised sugar there is in a given sample, as compared with the quantity of non-crystallizable, or what is commonly called treacle. M. Dubosch Soleil's apparatus is considered so accurate that the French Government has adopted it to determine the value of raw sugars imported into the country, and the customs duties are levied upon the results given by this instrument. I may further add that this apparatus, called "Polarising Saccharometer," is based on the peculiar property which light has when polarised, or when its rays are received at an angle of

35°25' degrees on a plate of tourmaline or a mirror. M. Dubosch Soleil's apparatus enables him to work with polarised light, which presents the various colours of the spectrum, in such a way as to enable him thereby to determine, as I have already stated, the amount of crystallizable sugar in any given quantity of the article, sufficiently accurately for all commercial purposes.

It is impossible for me, in a single lecture, to attempt to give you an idea of the various improvements which have been effected, even within the last two years, in the arts of photography, Talbotype, photozincography, glyptography, or other processes which are due to the action of light on sensitive surfaces; but you will find an excellent paper on the application of photography, and also of light to sensitive surfaces as applied to the art of engraving, in vol. xiii., page 181, of this *Journal*, by Mr. S. T. Davenport, under the heading of "Engraving and other Reproductive Art Processes." Still there are two discoveries which appear to me to deserve passing notice, viz., the carbon process of Mr. Swan, and also the process discovered by M. Villème, and now carried on in London by a company, by which the operator is enabled not only to take the photograph of a person, but to produce a statuette giving a full representation of the figure itself, and a far more accurate personification than could be produced by any sculptor, and that at a cost of as many shillings as the sculptor would expect pounds. But the most important series of researches which have been made of late years in connection with photography, and to which I deem it my duty to call especial attention, are such as to acquire more and more importance as they are more developed; I therefore feel convinced that any one who will devote his talents to the study of this particular branch of photography, will in time be amply rewarded, and of this there can be no doubt, when we consider the results already obtained by the labours of only two or three gentlemen. I refer to the reproduction of the various colours of the spectrum upon sensitive surfaces. In 1838, Herschel was the first to publish a paper on the various colours which chloride of silver is susceptible of taking under the influence of certain coloured rays of light. Mr. Robert Hunt also published, in 1840, a paper referring to the subject; but the most complete series of researches on the subject of the reproduction of the colours of the spectrum, and which led to a process by which several of the colours of the spectrum could be reproduced on a sensitive surface, is due to Edmund Becquerel. The results arrived at by this gentleman were so remarkable that they drew the attention of the whole scientific world; and the following is an outline of the processes which were applied by him to obtain this interesting result. He took a daguerreo-

type plate or a silver plated one, and having dipped it in a weak solution of chlorine, or, what was still better, a weak solution of hydrochloric acid, by connecting it with the poles of a battery, the brilliant silver surface acquired different tints, passing gradually from an opaque white to a black tint. He also observed that the tint best suited to obtain favourable results was when the plate had acquired a pearlish pink; and although he found that the plate so prepared, when placed in the camera obscura, assumed the colours composing the spectrum, still they were faint, but he remedied this defect of intensity of tints by heating for several hours to a temperature of 95° to 100° the chlorinated plate, and then submitting it to the influence of the various colours composing the spectrum. Further, in the course of his studies he made the important observation that he could replace the peculiar action of heat on his prepared daguerreotype plate by exposing it to the rays of the sun under a sheet of paper which had been steeped in an acid solution of sulphate of quinine. The effect of this was that the plate of silver assumed an intense white colour, nearly resembling that of paper; whilst, if the protective paper had not been used, the silver plate would have gradually acquired a dark tint, and would have lost the whole of its sensitive properties, the protective paper having the power of arresting completely the most refrangible rays of light, especially those which are beyond the line H of the spectrum. Notwithstanding M. Edmond Becquerel's ardent hopes to find a method which would enable him to fix on a sensitive surface the various colours of the spectrum, still he failed, for they faded immediately they were exposed to the direct rays of light, and could only be preserved in obscurity. But there is one gentleman who deserves great praise for the extraordinary perseverance which he has shown in this class of investigation. I mean the nephew of the discoverer of photography, M. Niépce de Saint Victor. Although I will not enter here into the details of these valuable researches, as they can be found in the *Comptes Rendus de l'Académie des Sciences*, still I may just be allowed to state that he has not only by the following process obtained far more brilliant colours than those first produced by M. Becquerel, but has succeeded in reproducing on sensitive plates the various colours of coloured surfaces, such as are presented by fabrics, flowers, &c., and further, he has lately been so fortunate as to reproduce on his plates yellow and black tints, which had resisted all previous attempts. To give you an idea of the facts arrived at by this gentleman, I may state that he has succeeded in so fixing upon sensitive surfaces, the various colours of the spectrum, or of coloured surfaces, that they will bear the action of diffused light for several days. In fact, I have seen photographs which reproduce faithfully a small doll dressed up in various colours, and in which even the most minute ornament could be traced, and what is certainly not less interesting was the reproduction of the iridescent colours of the peacock's feather. To obtain these marvellous results, M. Niépce de Saint Victor takes a daguerreotype, or silver-coated plate, and dips it into a weak solution of hypochlorite of sodium, having a specific gravity of 1.35, until it has assumed a bright pinkish hue. The plate is then covered with a solution of dextrine, saturated with chloride of lead; it is then dried, and subsequently submitted to the action of heat, as in M. Becquerel's experiment, or under the screen of sulphate of quinine, also referred to above. The plate is then ready to be placed in the camera obscura, and to receive the colours of the spectrum, or representations of nature, such as flowers, as well as certain colours produced by man. Lastly, he succeeds in increasing the stability of the colours developed on the sensitive surface, by covering the plate with an alcoholic solution of gum benzoïn, and M. Niépce gives the name of Helio-chromie to this branch of photography.

During his lengthened researches, M. Niépce de St. Victor has made two series of observations which I deem it my duty to lay before you, viz., that he can pro-

duce with facility, on prepared plates, the binary colours of the spectrum, viz., orange, violet, indigo, and green, if those colours are natural; but if they are artificially produced by the mixing of two of the primary colours, as red and yellow, or orange and blue, and yellow or blue, he cannot reproduce the binary colour, but only one of the two colours employed by the artisan to prepare them. Thus, for example, he can reproduce the natural green of malachite, and the beautiful colour known as Scheer's green, but he cannot do so with a mixture of Prussian blue and yellow chromate of lead, the blue only reappearing. These facts enable him to explain why, in ordinary photography, the leaves of plants always appear black, and why, when he attempts to fix on his plates the colours of leaves, they have a bluish hue, the yellow portion of the colour not being reproducible.

M. Niépce has made another series of observations which deserve notice, viz., that when a plate, prepared by his process, is dipped in an alcoholic solution of substances susceptible of imparting a colour to a hue, such, for example, as strontia, which communicates a red hue to it, or baryta, which gives a yellowish-green colour, the prepared plates when exposed in the camera will assume the same colour as the salt which they have on their surface would impart to the flame of alcohol; and if a salt of copper be used, which has the property of communicating a variety of tints to the flame of alcohol, the plate also will assume a variety of tints when exposed to the action of light; and during a certain period of his lengthy researches M. Niépce availed himself of this curious phenomenon to obtain coloured plates in the camera. They are not only interesting as reproductions of art, and as a feat of extraordinary skill in the progress of photography, but they are especially so because a time they will lead to methods which will enable us to communicate to our little children perfect and correct views of our time, and other interesting facts connected with the period in which we live.

All persons interested in the progress of photography will find full details of the new processes for reproducing vitrified photographic plates in vol. 60, page 1223, of the *Comptes Rendus de l'Académie des Sciences*, 1865; these I omit, as they are purely technical, and have only an interest for those immediately engaged in that branch of the photographic art.

I shall now have the pleasure of calling your attention to a most important series of researches published by Professors Bunsen and Roscoe; but, to enable you to appreciate their value, it is necessary that I should make the following remarks:—It is now well known that the solar spectrum is composed of three primary colours—blue, yellow, and red; and, also, of two complementary or binary colours, viz.—orange, green, indigo, and violet. It is also known that these colours represent different properties or qualities of that universal fluid called ether, which, I may say was generalised by Sir Isaac Newton under the name of gravitation, on which the whole of the planetary system is based, and which gives to the universe its harmony and stability. This fluid is susceptible, under certain influences, as those generated by the sun, of being set in vibration, and thus are generated heat, light, and chemical rays; and further, as there is no chemical action without a corresponding production of electricity, it follows that electricity, as well as magnetism, may be considered as a mere modification in the vibrations of the same fluid. Therefore we may truly say that all the imponderable fluids called Light, Electricity, Heat, Magnetism, and Force, have all the same origin, namely, the fluid called ether, and which, according to the nature of the vibrations it develops or renders palpable to our senses one of these fluids. In fact, I feel convinced that this unique fluid is not converted into those divers fluids by special modifications of its own vibrations, but that they only become manifest to our senses when it has imparted its own special vibration to the particles of matter, and that it is

the peculiar vibration which it imparts to the molecules of matter that develops in the molecules themselves such a mode of vibration as gives birth to what we call light, electricity, magnetism, heat, and force. In fact, there is no doubt, from the researches of Dr. J. P. Joule, Professors William Thomson, Mayers, and others, that heat and force are the same fluid, for Dr. Joule has given us the exact measurement of that force. He has demonstrated that the amount of heat necessary to raise one pound of water one degree in temperature, would, if applied mechanically be competent to raise one pound eight 772 feet high, or it would raise 772 pounds one foot high. The term "foot pound" has been introduced to express in a convenient or systematic way the lifting of 772 lbs. to the height of one foot. Thus the quantity of heat necessary to raise the temperature of a pound of water one degree being taken as a standard, 772 foot pounds statute, is what is called the mechanical equivalent of heat. Dr. Tyndall, in his valuable work on "Heat considered as a Mode of Motion," gives many interesting examples of the conversion of heat into force, and *vice-versa*. For example, he cites the following theory of Professor Thomson, who assumes that an immense amount of force is converted into heat when meteoric matter is attracted to the surface of the sun by the molecular attraction called gravitation; that the force generated by the immense velocity with which meteoric matters travel towards the sun, becomes converted instantly by its contact with the sun into heat; and further, he considers, that the showering of meteoric matter, as well as that of the zodiacal lights on the sun's surface, are sufficient to account for the immense heat which he supposes the sun's surface to possess. I must say that I do not believe that the sun possesses much heat or light; I believe that it is only an immense mass which, by its size as compared with the rest of the planetary system becomes the centre of gravitation; and that there exists between it and the planetary bodies a constant state of attraction; that the fluid called ether, which represents the force called gravitation, is in a constant state of activity throughout the universe, and brings about that Godly and admirable harmony which pervades it; and although the ether filling space can be considered in a constant state of action or vibration, and convertible into the fluids which we call heat, light, electricity, and magnetism, still these fluids only become manifest to our senses when they put into vibration the particles of matter, or produce, according to their peculiar vibration, the phenomena of light, electricity, magnetism, heat, and force; for if heat is convertible into force, as asserted by the researches of the eminent savants above stated, why should not the production of other fluids be due also to similar phenomena? If it be true, as Joule, Thomson, and others contend, that force and heat are due to the vibration of the molecules of matter, and that according to the rapidity of the vibrations of such atoms (imparted to them by the vibrations of ether) one or other of these forces is engendered, why should not the manifestations of other fluids be traced to similar causes? In fact, no doubt can exist in my opinion with respect to electricity and magnetism, for if their manifestations to our senses were owing to the vibration of a universal force it would affect all bodies in the same way and in the same degree. Now this is not the case; for there are good and bad conductors. Therefore it follows that the atoms composing matter, or more so, their nature, have an influence on its degree of manifestation. The same with magnetism; for we find oxygen to be magnetic, and nitrogen non-magnetic or diamagnetic. Thus it appears to me from these facts, which might be multiplied if time permitted, that the manifestations of heat, force, electricity, and magnetism are not peculiar and distinctive fluids, but are due to the modification in the mode of vibration of the universal fluid called ether, which imparts to matter its peculiar undulations, and that these forces are only made mani-

fest to us when the vibrations come into contact with solid matters such as compose the atmosphere or the earth. Therefore, I am of opinion that there is no light, heat, electricity, or magnetism beyond the limits of the atmosphere which surround the earth; but that when the ether, which is in a state of vibration, comes in contact with the particles of matter composing our atmosphere it then communicates one of its own peculiar vibrations to these particles; then they, by their vibrations, become luminous. If this theory is correct, it follows that the production of the phenomena of light is due to the vibrations of solid matter, and not to the vibrations of the ether, as is assumed by the philosophers of the day.

I very well know that these views of mine are completely in contradiction with those entertained by most of the philosophers of the day; but still I hope to be able to publish a sufficient number of scientific researches, as well as to draw attention to such a number of physical, chemical, and astronomical facts as may, even if not proving the truth of my views, at all events, I hope, deserve some attention.

Now, let us return to the subject under consideration, viz., that a spectrum is produced by the decomposition of light when it is refracted at an angle of 60° ; and that the result of that decomposition is the production of three primary and four binary or complementary colours. Further, that the red portion of the spectrum represents calorific rays of light; that the green and yellow represent light-giving rays, and violet and the rays beyond it the chemical or actinic rays of the same. Philosophers have for a long period been able to measure accurately the intensity of the heat-giving rays, by means of a thermometer or the thermo-electric pile; and though we had a general knowledge of the intensity of the chemical rays of light, still we had no method of accurately measuring its real intensity, and conveying our results and observations to others, till Professors Bunsen and Roscoe filled up this important gap. These gentlemen's researches will be of great service to science and to society, as they will throw much light on many meteorological data, and enable a chemist to study with more precision than has been previously done the chemical phenomena of vegetation and other phenomena connected with the chemistry of agriculture. For example, the thermometric observations giving the mean monthly or yearly temperature of a country, by no means yield all the data required for the estimation of the true climatology of the place, or of its plant or animal producing capabilities. For these purposes we require to have not only the amount of solar heat directly or indirectly reaching the spot, but likewise the amount of chemical active solar light which may be present there. This is strikingly exemplified by the following example given by Dr. Roscoe on a comparison of the mean annual temperature between Thorsbawn, north latitude, $62^\circ 2'$; west longitude, $6^\circ 46'$; temperature, $45^\circ 6'$; and Carlisle, north latitude, $54^\circ 55'$; west longitude, $2^\circ 58'$; temperature, $46^\circ 9'$; difference, 1.8. From these figures it will be seen that the mean annual temperature is nearly equal, but the quantity of sunlight falling upon those two places differs most widely, and we have a corresponding difference in true climatological results. Thus the flora of the Faroe Islands and the Shetland Islands is of a most limited description. Only hardy varieties of shrubs, and no trees or flowers exist there, while at Carlisle we have a luxuriant vegetation accompanying a most sunny sky. How essential, then, are the rays of light to vegetation. These gentlemen have also ascertained that those rays are in ratio with the intensity of that light; and still further they are also in ratio with the chemical or actinic rays of the sun; and thus the researches of these savants will enable them to measure with accuracy those chemical actions. It is impossible, in a lecture like this, to render justice to their researches, therefore I must refer those who wish to consult them to the Philosophical Transactions of the Royal Society. Still I may state that

these gentlemen's photochemical instruments are based on the following data, namely, that equal intensity of light produces in the same given space of time equal shades of tint on surfaces prepared with chloride of silver of uniform sensitiveness. Thus it is shown by experiments that a tint attained by paper so prepared is constant when the quantity of light falling upon it also remains constant. Light of an intensity of 50° falling upon a paper for the time of one minute produces the same blackening effect as light of the intensity of one falling upon it for the time of 50 minutes. Knowing these laws which regulate the degree of shade of the paper, and having a surface of a perfectly constant degree of sensitiveness, it is easy to obtain the absolute measurement of the chemical action of light.

The next discovery to which I desire to draw your attention is still in its infancy; but I am induced to refer to it from two considerations. The first, that it may render great service to society by enabling us to preserve the lives of many thousands of our fellow-creatures in our coal-mines and other underground works, and also because it is a beautiful illustration of the amount of knowledge that a man requires at the present day either to understand or appreciate fully the discoveries of others, or to enable him to attempt any original invention of his own. Unless a person possesses the rudiments of the leading sciences of the day he will never be anything but an imitator, and will never succeed in improving the inventions already made. It is certainly most interesting to witness how the most abstruse branches of science are brought to bear on arts and manufactures, and no better example can be given than the application of electricity under various forms to what is commonly called the telegraph. The invention which I am now about to bring to your notice is due to M. Dumas, a young French engineer, and to M. Brequet, of Paris, who is also practically connected with telegraphy. To enable these gentlemen to carry out their discovery they have had to study, and be perfectly acquainted with, the researches of many of the most eminent men that science has produced during the last half century. Thus they employ the galvanic battery which was discovered by Galvani, and perfected by many philosophers, until brought at last to its present perfection. They use a mixture of bichromate of potash and sulphuric acid in a Bunsen battery. They have also had recourse to magneto-electricity, first discovered by Faraday, and brought to its present perfection by the researches of MM. Nobili, Mason, Becquerel, Joule, and others; and to enable them to construct their apparatus they have applied, with great ingenuity, the inductive coil, the result of many successive discoveries, and brought to great perfection by Ruhmkorff, the vibrating interrupter of Dancer, and also the condenser of Fiquier. Further, they must have had the knowledge of the stratified light and the application of it by Gassiot: the fluorescence of light by Stokes and Becquerel, and their applications to glass by Geiseler. All these facts prove the correctness of my statement, how vast is the amount of knowledge required to make a little discovery. The apparatus invented by these gentlemen is portable, for a miner carries on his back the above-mentioned galvanic battery, and this generates the force required, which is multiplied, increased, and brought to light by the Ruhmkorff coil, which is also confined in the same leather case, occupying only six inches; the magneto-electricity passes through wires covered by vulcanised india-rubber, and these are in connection with a thick glass tube, in which a vacuum has been made, and this contains a fluorescent tube of Geiseler, which becomes luminous or fluorescent by the passage of the electricity through it, generated by the coil and the battery.

Although both light and electricity are most interesting subjects, and could well be made the subject of many lectures, still I am bound to leave them on one side, and draw your attention to other facts deserving of notice. It is well known to all chemists and philosophers that matter

has a great tendency to assume a geometrical or crystalline form, and that whenever the atoms of matter are sufficiently free for molecular attraction to have its full influence attraction between the atoms takes place, and gives birth to well-defined crystals. The following examples can be cited:—The slow condensation of the vapour of iodine, which gives rise to well-defined crystals as well as those of camphor and other volatile bodies. When sulphur, bismuth, and other substances are melted, and allowed to cool slowly, and the excess of the fluid remaining among the crystals is poured off, well-defined crystals are found to exist in the mass, which apparently would have disappeared had not the excess of fluids been poured off, for in this case the molecules of the remaining fluid mass would have solidified among the crystals, and would have prevented the observer from seeing that the molecules when freed in the fused mass had assumed a crystalline form. The tendency of molecules to assume a geometrical form presents in many instances curious phenomena. Thus, for example, a vessel may contain acetic and carbolic acids—and if, say at a temperature of 40° or 50° , a crystal of either of those substances is placed in contact with its own fluid, the entire bulk of fluid passes in a few seconds into a solid crystalline mass. The manifestation of that force is also beautifully illustrated in the following instance:—If a tin plate be heated to a moderate temperature, and a drop of water be allowed to fall on its surface, and the plate be dipped for a few minutes into weak muriatic acid, it will be observed that the whole surface of the plate is affected, and that where the water fell it has assumed a most beautifully waved and iridescent surface. If the surface be examined under the microscope it will be found that under the influence of the vibrations generated by the cold fluid falling upon the heated plate, the mass of molecules have passed from their amorphous condition to that of a crystallised one. We all know this alteration in the tin-plate surface was particularly applied many years ago to produce variegated surfaces on our tea-trays and other similar domestic vessels. It should also be stated that this effect was greatly enhanced by the skilful application of coloured varnishes, which increased the value of the mercantile article. This discovery, which is due to an eminent chemist of the name of Prout, clearly proves, as those before cited, the power which matter has to assume a crystalline form. I cannot, however, refrain from adding the following instances, which the mere vibration of particles of matter is sufficient to change amorphous bodies into crystalline ones. The first is that which often takes place in the iron used on railways. The most striking example is that of the iron links used to unite waggons where it is found that the fibrous, tenacious link made of malleable iron is transformed into a crystallised, brittle link by the constant vibration it is subjected to by railway traffic. Another example is that shown by the peculiar acid exercised by intense cold on the molecular state of iron, as shown by the brittleness of the metal in Russia and other cold climates; this was the case in December, 1851, in England, when, as will be remembered with regard to many railway accidents occurred, owing to the rails becoming crystallised and brittle.

The power which molecules have to assume a crystalline form has recently been the study of Mr. F. Kuhlmann, an eminent chemist of Liège, and he has given to that force the name "crystallogenic." I shall endeavour to give before you a short epitome of his researches, which are not only interesting in a scientific point of view, but also in consequence of the mode in which he has applied it in connection with arts and manufactures; and the whole takes an especial interest in the matter will be with pleasure his researches in the *Comptes Rendus de l'Académie des Sciences de Paris*. M. Kuhlmann has mixed a certain class of substances which crystallised with facility, such as mannite, sulphate of iron, copper, with a thick solution of gum, or any other

substances interfering with the free crystallisation of these substances and having spread the mixtures on glass, he found, by exposing such prepared plates to the atmosphere, that gradually the water would evaporate, leaving a dry mass, in which could be observed most beautiful arborizations. Each of the solutions will produce a well-defined design which is not always identical although operating under the same circumstances. Still they assume very similar forms, being in some instances that of stars, and in others that of leaves and wreaths. These modifications are obtained by the strength of the solution, the nature of the salt and the mode of preparation. Kuhlmann further observed, that if amorphous substances, such as magnesia and sesqui-oxide of iron, or chromium, be mixed with bodies susceptible of crystallisation, and these added to a gummy fluid, the amorphous particles are drawn into the crystallising substances and follow the outlines; and if these are produced on surfaces, such as those of glass or porcelain, and heat applied, the gummy matter will be destroyed or volatilised, and the crystalline medium and the amorphous substances become incorporated, and fixed in the porcelain, reproducing on its surface a crystallogenic design. These researches which I have the pleasure to lay before you will show you the probability of carrying out these results to a satisfactory issue. Of course, the glass or porcelain manufacturer will easily understand that he will have to use borax or phosphate of soda, or other flux, as a crystallising medium, if he wants to produce in his art the results that I have stated. M. Kuhlmann has applied his crystallogenic process with great success to photography, and also to the art of engraving metals. As the latter may have some interest, I will give you an outline of his process. It consists in producing a crystallogenic design on the surface of an iron or copper plate, and then applying on the so-prepared surface—say a sheet of lead or copper—and submitting them to high pressure when the design would be impressed upon the plate. The embossed plates, by being placed in a prepared solution, and in connection with a galvanic current, will easily give birth to a *fac-simile* in relief, which can be used as a printing surface. It is with pleasure that I am able to state that though I part with these interesting researches for the present, I shall have the satisfaction of referring to them again in a subsequent part of this course of lectures, when I shall speak of some researches of this gentleman which have a more immediate bearing on the progress of science.

It has been for a long time a disputed question whether the stained windows we all admire in old cathedrals could be restored in such a way as to resume the brilliancy they had at the time they were placed there by the artists. At all events there is now no doubt that this can be effected by the process discovered by my eminent master, M. E. Chevreul, as is proved by the application of it in connection with the restoration of stained windows existing in a well-known church in Paris—that from which the tuncin of St. Bartholomew was sounded, “St. Germain des Près.” The process devised by M. Chevreul is highly practical; it consists in removing the stained glass from the windows, and dipping it for several days, first, in a weak solution of carbonate of soda of a specific gravity of 1.068, then washing it, and dipping it for several hours in a solution of muriatic acid of a specific gravity of 1.080. On the glass being washed and dried, it will be found as brilliant and beautiful as when it came from the hand of the manufacturer. M. Chevreul has found that the dim and dirty appearance which stained glass assumes by time is due, especially in large towns, to the various products of smoke being first condensed on the glass by fog and rain, and then becoming oxydised they act as a cement to various mineral matters, such as chalk, gypsum, oxide of iron, &c., which help to impoverish the transparency of the glass. The alkali acts upon the organic matter and dissolves it, while the muriatic acid removes the minerals. The durability of glass placed in

our monuments is extraordinary, when we bear in mind the curious results published some years since by the eminent chemist, Pelouze, who observed that when window, bottle, and other varieties of glass were reduced to a fine powder, and mixed with water, they were soon acted on, yielding a large quantity of silicate of soda to that fluid, amounting in several cases to eight or ten per cent. in cold water, and even to thirty-six per cent. when the finely pulverised glass was boiled in water; and that, in many cases, it was a definite compound which was dissolved from the glass, namely, a silicate of soda, composed of three equivalents of silica and two equivalents of soda. M. Pelouze explains the extraordinary difference in the effect which water produces on glass when in large masses or plates, as compared with its influence on the same substance when reduced into a fine state of powder, by assuming that, in the first instance, water does not act because it seldom remains sufficiently long in contact with the glass to act upon the elements which compose it; while, in the second case, there exist numerous points of contact between the fluid and the solid body, thus facilitating the action of the fluid on the solid material. I am inclined to think that the peculiar molecular condition the surface of glass assumes, when manufactured in plates or otherwise, must exercise a great influence on the property which glass has to resist the action of water. If it were not so, how could be explained the limited action which watery fluids, such as wine, cause upon the interior surface of a bottle, though they remain in contact for many years? I can conceive glass assuming a peculiar surface by the pressure of the atmosphere, thereby producing a homogeneous one susceptible of resisting the action of water. A similar instance occurs in the case of polished steel, or of the rolled surface of wrought iron, or the skin of cast iron, which resist the chemical action of either air or acids in a far greater degree than does the interior of the substances which compose those metallic bodies.

Whilst dwelling upon old materials, you will allow me to give you an outline of a process devised by M. Stahl for the preservation of antediluvian fossils. We are aware how interesting it is to preserve relics of past ages, giving us some of the conditions of the world at various periods. Those relics are exceedingly fragile, and after many clumsy attempts M. Stahl arrived at his discovery. If the fossil is compact and comparatively firm, it is saturated by means of a brush with melted spermaceti, but if it is friable, it is necessary to employ a melted mass composed of four parts of spermaceti and one of colophony resin, which in cooling gives great solidity to the mass of the fossil.

I would, in conclusion, draw the special attention to all artists who take an interest in decorative art to the interesting papers published recently by M. Oufroy on the one hand, and M. Wiel, of Paris, on the other; the first being in the *Technologie* of last year, the latter in the *Annales de Chimie et de Physique*, on their respective methods for covering a metal with another more valuable by its properties or precious by its qualities. These methods have a special reference to cast iron or wrought iron. In Paris these processes, which may be regarded as not only ornamental but useful, have been applied with great success. Thus, for example, instead of the dirty, pitchy black lamposts which ornament our English towns, there can be seen in Paris elegant, well-designed, bronze-like posts, which are pleasing to the eye. The same can be said of the fountains on the Boulevard Sebastopol, the Place de la Concorde, and many other public promenades in Paris, which excite the admiration of foreigners visiting that city.

PORTUGUESE INTERNATIONAL EXHIBITION.

The Portuguese International Exhibition was opened on the 18th of September, with great rejoicings. At one o'clock in the afternoon the King and Queen, Dom Fer-

dimand, and Dom Augusto, entered the Crystal Palace with a brilliant suite, and were conducted through the central nave to the throne prepared for their Majesties; an address was then delivered by Senhor Antonio Braga, President of the Central Committee of the undertaking, to which the King replied in the following terms:—

"Among you, illustrious Portuguese, none may doubt of our progress, none may fear that it is slow and indefinite.

"Nations fall from their splendour by the errors of men or natural calamities. But it is also certain that they rise gloriously to the resonant voice of patriotism and liberty. And with the same rapidity with which they were cast down are they impelled towards prosperity, if with good faith and firm steps they enter upon the path of reforms, the sole course by which the moral and physical regeneration of peoples can be effected.

"This movement, once commenced, becomes a necessity of such magnitude and urgency, that no benefit remains circumscribed by the area traced out by its author.

"Thus Portugal, after a long period of misfortune, which caused her to lose the *prestige* of her past greatness, has now, Providence be thanked, entered upon a new epoch of efforts and enterprises, which, encouraged and fortified by peace and liberty, will assure to her, in a brief future, the place which she once occupied among the most cultivated and fortunate nations.

"The first International Exhibition which took place in the capital of the commercial world was followed by that of Paris. And such is the power and influence of the progress of humanity, that in little more than ten years a city of the second order, in a country hitherto considered to be a century behind most nations, gathers to her bay, for your honour, the manufactures of both worlds and the wonders of art and intelligence.

"This spectacle is, then, a great glory for Portugal, and a well-founded hope for the future. Arduous was the mission of my honoured grandfather in implanting the liberal institutions we now enjoy; and arduous also the task of my august brother, evangelising and exalting among us the sublime idea of the supremacy and glorification of labour.

"Such facts cannot be forgotten, and your allusion to them at once affects and gratifies me.

"Invited by you to assume the presidency of the Crystal Palace, and later to give an impetus, as you express it, to the development of the Exhibition, I acceded with the greatest pleasure, recognising all the importance of the undertaking.

"The spirit of the age, the example of my brother, and the love I bear to my country and my subjects, will lead me to embrace and second with all my endeavours this generous and highly civilising idea, whose realisation will give to our country much higher consideration among foreign nations, and will increase our own self-respect, thus raising public spirit to the height from which naturally and spontaneously spring patriotic actions.

"This contest of labour, this truly national festival, is so striking a proof that we are advancing on the path of progress, it opens up to the national industry so many improvements, and promises such various advantages to the country, that I feel real pride that this great event should take place as a happy prelude at the commencement of my reign.

"My honoured father, the enlightened president of the Exhibition, accepted and undertook in the same manner so pleasing a charge. His august name, as you well presumed, immediately secured the public sympathy for this great work. The most distinguished artists, and the most intelligent and industrious nations, hastened to respond to our invitation. No nation, however powerful and advanced, disdained to come and take their place among the laborious Portuguese. Honour to them for this, as it is to us a motive of gratitude.

"To the wishes you express for my happiness, that of my beloved consort, the Prince my august father, the In-

fante Dom Augusto, and the Royal Family, I respond with the most fervent wishes for the greatness and welfare of the country which has been our cradle."

His Majesty concluded by declaring the exhibition open, amidst the greatest enthusiasm from the numerous and select concourse of spectators, native and foreign. Real salutes were fired from the forts of Serra do Pilar and in honour of the event. The royal party were afterwards conducted over the various departments of the building, several pieces, specially composed for the occasion, being meanwhile performed on the great organ. The greater part of the foreign diplomatic corps, the whole of the consular body, all the ministers, the court dignitaries, and nearly all the members of parliament, were present at the ceremony, which was favoured by splendid weather. England is very well represented, the display of her manufactures being excellent.

PARIS UNIVERSAL EXHIBITION OF 1867.

The Imperial Commission has issued the following regulations specially referring to British exhibition:

SECTION I.—GENERAL ARRANGEMENTS AND SYSTEM OF CLASSIFICATION.

Art. 1.—The Universal Exhibition to be held at Paris in 1867 will be open for the reception of works of art and of the products of agriculture and industry of all nations. It will be held in a temporary building on the Champs de Mars. Around the Exhibition building a park will be formed for the reception of cattle and other live animals and plants, as well as for those constructions and objects which cannot be exhibited in the main buildings. The Exhibition will open on the 1st of April, 1867, and will close on the 31st of October following.

Art. 5.—The commissions appointed by the various foreign Governments to direct the part which their respective countrymen will take in the Universal Exhibition are in direct communication with the Imperial Commission relative to the exhibition of the works of art and other productions of their country. Consequently, the Imperial Commission will not correspond with foreign exhibitors. Products sent by a foreign exhibitor cannot be admitted through the medium of the foreign commission which represents him. The foreign commission will also provide, as they may see fit, for the carriage, reception, the arrangement, and the return of the productions of their countrymen. They must, however, conform to the regulations laid down by the Imperial Commission.

Art. 6.—Foreign commissioners are requested to present themselves as soon as possible in relation with the Imperial Commission, and to depute some person to represent them. The duty of this representative will be to arrange the questions which refer to foreign exhibitors, and particularly those relative to the allotment of the whole space among the various countries, and to the manner in which each foreign section shall be arranged in the Exhibition building and in the park.

Art. 7.—In order to facilitate the division of the space allotted to each country between the various classes of objects enumerated in Article 11, the Imperial Commission will place at the disposal of the representatives for the guidance the plan of the arrangement of the French section of the Exhibition building, drawn on a scale of ten millimetres to a metre (1 in. to 41-6 ft. or 1-600 th. The plan shows the arrangement of the glass cases and counters suitable for each class of objects, as well as the step height, and other dimensions of the courts intended for each class. An analogous plan of arrangement, showing the manner in which the portions of the Exhibition building allotted to each foreign country will be subdivided, is to be transmitted to the Imperial Commission before the 31st of October, 1865. Plans in detail, on a scale of five centimetres to the metre (1 in. to 4-16 ft., or 1-32 ft.) showing the place allotted to each exhibitor and to each

parate stall, are also to be forwarded with the list of exhibitors by each foreign commissioner before the 31st of January, 1866, in order that in arranging the interior of the Exhibition building the Imperial Commission may be able to take into consideration the wants of each country.

Art. 8.—Each foreign country may claim, for the formation of a special park, the portion of the Champ de Mars adjoining the space allotted to it in the Exhibition building. The representative of each foreign commission will settle with the General Commissioner the plan of the site for the circulation of the public, and of the earthworks, which will be executed at the cost and under the direction of the Imperial Commission. Each representative will also arrange with the General Commissioner, so as to leave at the disposal of the Imperial Commission the portions of the ground which may be in excess of the wants of his countrymen, or to obtain an additional piece of ground from the portions to which other representatives may have given up their claim. In order to facilitate as much as possible the arrangements of the foreign exhibitors in the portions of the park allotted to them, the Imperial Commission will place at the disposal of the representatives for their guidance the plans adopted by the French exhibitors for arranging the animals, plants, model stages, &c.

Art. 9.—An official catalogue of the products of all the foreign countries will be drawn up, showing the place which they occupy either in the Exhibition building or in the park. This catalogue will contain two alphabetical lists—one of the exhibitors, the other of the products exhibited. Foreign commissioners are requested to send the information necessary for the preparation of the catalogue before the 31st of January, 1866.

Art. 10.—Those States which can only be represented at Paris in 1867 by a small number of exhibitors, and which are besides in a similar geographical position, are requested to concert together so as to insure a methodical grouping of the products of an analogous nature. The Imperial Commission will place at the disposal of the representatives of the commissions of those States the plans which have been prepared, with a view to harmonize the advantages of such a grouping with the fundamental rule of national representation. In the event of these plans being approved, the Imperial Commission requests the commissioners of these same States to appoint in Paris for each group an agent whose duty it will be to carry them out. The architects and officers of the Imperial Commission will afford assistance gratuitously to these agents.

Art. 11.—In each section assigned to the exhibitors of the same country the objects will be divided into 10 groups and 95 classes, viz. :—

- 1st Group.—Works of art (classes 1 to 5).
- 2nd Group.—Apparatus and applications of the liberal arts (classes 6 to 13).
- 3rd Group.—Furniture and other articles intended for dwelling houses (classes 14 to 26).
- 4th Group.—Clothing (including fabrics) and other articles worn on the person (classes 27 to 39).
- 5th Group.—Products (raw and manufactured) of mining (classes 40 to 46).
- 6th Group.—Instruments and processes of the common arts (classes 47 to 66).
- 7th Group.—Food (fresh and preserved) in various states of preparation (classes 67 to 73).
- 8th Group.—Live products and examples of agricultural establishments (classes 74 to 83).
- 9th Group.—Live products and examples of horticultural establishments (classes 84 to 88).
- 10th Group.—Objects exhibited with the special purpose of improving the physical and moral condition of the people (classes 89 to 95).

The objects which are included in these groups are given in detail in the System of Classification (Appendix A) annexed to these regulations. In order to avail itself of any suggestions that may be made by the French ex-

hibitors and the Foreign commissioners, the Imperial Commission reserves to itself the right to resolve, in the successive editions of this document, all doubtful questions to which this first publication may give rise.

Art. 12.—No work of art or object exhibited in the Exhibition building or in the Park may be drawn, copied, or reproduced in any manner whatever, without the authority of the exhibitor who is the author of it. The Imperial Commission reserves to itself the right to authorize the taking of general views of the Exhibition.

Art. 13.—No work of art or object exhibited may be removed before the close of the Exhibition without the special authority of the Imperial Commission.

Art. 14.—Neither French nor foreign exhibitors will have to pay any rent for the space occupied by them in the Exhibition, but all costs incurred for fittings and decoration in the Exhibition building and in the park must be borne by them.

Art. 15.—Frenchmen and foreigners, by the act of becoming exhibitors, thereby bind themselves to adhere to these regulations.

Art. 16.—Works by French and foreign artists, executed since the 1st of January, 1855, will be received for exhibition.

Art. 17.—The following will not be received :—1. Copies, including those which reproduce a work in a manner different to that of the original. 2. Oil paintings, miniatures, water-colour paintings, pastels, designs and cartoons for stained glass and frescoes, without frames. 3. Sculpture in unbaked clay.

Art. 18.—The number and nature of the rewards that may be given in respect of works of art, as well as the constitution of the international jury who will be called upon to act as judges, will be decided hereafter.

Art. 19.—All the products of agriculture and industry will be admitted into the Exhibition with the exceptions and limitations mentioned in the following article.

Art. 20.—Detonating, explosive, and other substances of a dangerous nature will not be admitted. Spirits and alcohols, oils and essences, corrosive substances, and generally substances which may affect injuriously other products exhibited, or incommode the public, will only be received in strong vessels, specially adapted for the purpose, and of small dimensions. Percussion caps, fireworks, lucifer matches, and other similar articles can only be received when made in imitation and deprived of all inflammable ingredients.

Art. 21.—Exhibitors of products of an unwholesome and disagreeable nature will be bound to conform at all times to such measures of safety as may be prescribed to them. The Imperial Commission reserves to itself the right to cause the removal of any products, whether French or foreign, which by their nature or their bulk might appear injurious, unsuitable, or incompatible with the objects of the Exhibition.

Art. 22.—Exhibitors of apparatus requiring the use of water, gas, or steam, are to state, when sending in their application for space, what amount of water, gas, or steam, will be necessary. Those who wish to exhibit machines in motion are to state at what speed each of these machines is to be driven and the motive power which it will require.

Art. 23.—The cost of packing and carriage of the goods sent to the Exhibition, and of the goods which have been exhibited there, is to be borne by the exhibitors, both to and from.

Art. 24.—Packages from foreign countries must be marked in such a way as to show distinctly whence they come. The Imperial Commission will make arrangements with the Foreign Commissioners in order that these packages may be transmitted in accordance with the regulations specified in Article 40 for French packages; on this point, however, the Foreign Commissioners will adopt the course which they may consider most advisable.

Art. 25.—French and foreign goods will be received into the Exhibition from the 16th of January, 1867, up to the 10th of March following, inclusive.

Art. 44.—The Exhibition is constituted a bonded warehouse. Foreign goods intended for the Exhibition will be admitted into France, under bond, up to the 5th of March, 1867, by the following ports and frontier towns:—Dunkirk, Lille, Valenciennes, Feignies, Jeumont, Vireux, Givet, Longwy, Thionville, Forbach, Wissembourg, Strasbourg, St. Louis, Pontarlier, Bellegarde, St. Michel, Nice, Marseilles, Cette, Le Perthus, Hendaye, Bayonne, Bordeaux, Nantes, St. Nazaire, Granville, Havre, Dieppe, Rouen, Boulogne, Calais.

Art. 45.—The Imperial Commission will issue special instructions relative to the period when the materials for the buildings, as objects for exhibition, the separate parts of machines and apparatus, heavy and cumbersome articles, and those which require masonry or special foundations, are to be brought into the precincts of the Exhibition. Such works are to be performed by the exhibitors, and at their own cost, in accordance with the plans submitted by them for the approval of the Imperial Commission.

Art. 46.—The Imperial Commission will supply gratuitously the water, gas, steam, and motive power for the machines admitted under the regulation contained in Article 36. This motive power will, except in special cases, be transmitted by a horizontal main shaft, the diameter and the number of revolutions per minute of which will be made known by the Imperial Commission before the 31st of December, 1865. The exhibitors will have to furnish driving pulleys on the main shaft, connecting pulleys, and intermediate shafting for the purpose of regulating the proper speed of the apparatus, as well as the belts necessary for each of these motions. Steam-engines which require to be supplied with steam from their own boilers cannot be shown in the Exhibition building, and special directions will therefore be issued respecting them.

Art. 47.—All other expenses, such as the employment of workmen in the building, the reception and opening of packages, the removal and charge of packing-cases, the construction of counters, stages, glass and other cases, &c., the placing of goods in the Exhibition building and in the park, the decoration of the stalls, and the return of the goods, are to be borne by the exhibitors, French as well as foreign.

Art. 48.—The various stalls and fittings may be erected in the Exhibition as fast as the buildings are completed; they must be commenced at latest on the 1st December, 1866, and must be ready for the reception of goods before the 15th of January, 1867.

Art. 49.—The passages reserved outside the exhibiting space being strictly calculated for the purpose of circulation, packages and empty cases are not allowed to remain therein. Cases must therefore be unpacked as fast as they are received. The Imperial Commission will direct its own officers to unpack for the exhibitors, and at their risk and peril the cases left in the passages intended for circulation. From the 11th to the 28th of March, 1867, the goods already unpacked and placed in the stalls are to be arranged and displayed for exhibition. The 29th and 30th of March are reserved for the purpose of a general cleaning. A review of the whole Exhibition will take place on the 31st of March. The Imperial Commission will take all measures necessary to have the Exhibition complete in all its parts by the 28th of March. It will, therefore dispose of all those portions of space which on the 14th of January, 1867, are not occupied by stalls ready for the reception of goods, and of all those stalls which on the 10th of March do not contain goods enough to fill them.

Art. 51.—Immediately after they have been unpacked the cases that have been used for the carriage of the goods, either in France or from abroad, are to be removed by the exhibitors or their agents. If they should fail to do this without delay, the Imperial Commission will remove the cases and packing, and will not be in any way responsible for their preservation.

Art. 52.—Special instructions will be published hereafter for the organisation and arrangement of the products and objects for exhibition which are to be placed in the park.

Art. 53.—The name of the producer will be affixed to the goods exhibited. The name of the retailer who usually acts as his agent may be added with the producer's consent. The Imperial Commission will, when required, make arrangements for the exhibition of goods under the name of the retailer when they are not sent in exhibition by the producer.

Art. 54.—Exhibitors are requested to insert after their own names, or the names of their firms, the names of those persons who have contributed in a special manner to the merit of the products exhibited, either as inventors or designers, or by some process of manufacture, or by some remarkable skill in the workmanship.

Art. 55.—The cash price of the objects exhibited and the place where they may be purchased may be stated. This information must be given upon all objects included in Class 91. In all the classes the prices, if stated, must be adhered to by the exhibitor as respects the time, under penalty of exclusion from competition. Objects sold may not be removed before the close of the Exhibition without the special permission of the Imperial Commission.

Art. 56.—The Imperial Commission will take every means to preserve from damage the articles exhibited, but it will not hold itself in any way responsible for any loss by fire, or for any accident, damage, or injury, great or small, which may happen to them, from whatever cause it may arise. Exhibitors must take upon themselves the expense of insurance if they should see fit to avail themselves of that precaution. The goods exhibited will be watched by the necessary staff, but the Commission will not be responsible for any thefts or embezzlements which may be committed.

Art. 57.—A special notice posted in the Exhibition building and in the park will make known the staff appointed to organise the interior of the building. It will also contain the names of the officers whose duty it will be to give assistance to the exhibitors, and to watch over the security of the Exhibition.

Art. 58.—A ticket will be delivered to each exhibitor, which will give him free admission to the Exhibition. This ticket will not be transferable. If it should be proved that the exhibitor has lent or given his ticket to some other person, it will be forfeited without prejudice to further proceedings at law. To secure the carrying out of this regulation, the ticket of admission must be signed by the holder, who will have to enter the Exhibition by certain prescribed doors only, and he may be required to establish his identity by signing his name in a book to be kept for that purpose.

Art. 59.—Exhibitors will be allowed to have their goods taken care of by the agents they may select, but they must be approved by the Imperial Commission. Personal tickets of free admission will be given to the agents under the conditions laid down in the foregoing Article. An exhibitor's agent can only receive one ticket of admission whatever number of exhibitors he may represent.

Art. 60.—Exhibitors or their agents must not solicit visitors to make purchases; they will confine themselves to answering inquiries, to handing the address cards, prospectuses, and lists of prices which they may be asked for.

Art. 61.—The Imperial Commission will fix hereafter the prices of admission to be paid by visitors in order to be admitted into the Exhibition.

Art. 62.—An International Jury for making the awards will be formed, divided into nine groups, corresponding with the nine groups of the products of agriculture and industry enumerated in the system of classification. (Art. 11.) The number, the nature, and the various grades of the awards, as well as the constitution and functions of the jury whose duty it will be to apportion them, will be published hereafter.

Art. 63.—The objects will be studied and experiments conducted under the direction of the members of the jury, and of a scientific, agricultural, and industrial commission, appointed by the Imperial Commission.

Art. 65.—Immediately after the close of the Exhibition the exhibitors must begin to pack and remove their goods and fittings. This operation must be completed before the 30th of November, 1867. After that date, the goods, cases, and fittings which may not have been taken away by the exhibitors or their agents will be removed and deposited in a public warehouse at the cost and risk of the exhibitors. The objects which by the 30th of June, 1868, may not have been removed from that warehouse will be publicly sold, and the net proceeds of the sale will be applied to some work of charity.

The following is the form of application for space:—

Committee of Council on Education.—Sciences and Art Department, South Kensington Museum.—No. 4.—Demand for Space.

Name and Christian Name of Applicant,
or Name of Firm.....
Nature of Business carried on.....
Address—

No., street, or square
Name of town
Nature of goods to be exhibited
Space the applicant is prepared to occupy—
Length ... feet. Breadth ... feet. Height ... feet.
Remarks—

It is requested that this return, when filled up, may be forwarded not later than the 28th February, 1866, addressed to "The Secretary," South Kensington Museum. "Paris Exhibition, 1867," in the corner.

Fine Arts.

BORDEAUX SOCIETY OF FINE ARTS.—The Société des Amis des Arts of Bordeaux has just published the report of its fourteenth exhibition. The number of works exhibited amounted to 547, of which all but forty were sold. 163 of those sold realised more than £3,000. The exhibition was so well attended that the time of its duration was extended nearly two months. Of the purchases, two paintings and four bronzes were acquired for the museum of the town. The society bought fifty-three works for a sum total of nearly £900; these were distributed amongst its members by lot. The rest of the purchases were made by private persons. The total sums expended for works of art at the fourteen exhibitions of the society amount to nearly £25,000. The receipts of the society exhibit a regular annual increase; the number of subscriptions amounted this year to more than £900, and the whole expenses, including the carriage of the works exhibited, to no more than £360. The Emperor, the General Council of the Department, and the Municipal Council contribute to the exhibition.

TWO PICTURES BY RUBENS.—Two important works of this great master, which have been lost sight of for some time, are now in the hands of an amateur in Paris. One represents St. Veronica, the other the regency of Marie de Medicis. The former was executed in Italy, and the Venetians and the Romans both claim the inspiration, as regards style, for their schools; of this picture M. Auguste Conder, of the French Institute, says:—"I have never seen a picture which expresses poignant grief more eloquently. What poetry, what colour, what effect of light, what marvellous gradations of tints! The head of Christ has such an expression of suppressed sorrow and resignation that one cannot avoid being profoundly affected by it." The other picture was executed for the Gallery of the Luxembourg,

and its abstraction is not accounted for. Marie de Medicis has one foot in a boat, which represents France; her left hand holds an oar, while her right is in that of Minerva; the goddess tramples under foot old Silenus, who here represents the passions of the multitude. On the right of Minerva is Mercury, with one knee on Silenus, and the right arm supports a horn of abundance, and his left the crown and sceptre of France. Zephyr seizes a butterfly, symbol of pleasure and thoughtlessness. Above is Cupid, who holds a laurel crown in one hand and a palm branch in the other. The drawing and colouring of the picture resemble those of Titian, with the exception of the figure of Silenus, which recalls the style of Giorgione. The Venetian critic has said of this picture:—"The allegory of Marie de Medicis, in four principal figures, is of such remarkable beauty, that the composition may be called a poem in painting, to such an extent has the great Rubens shown himself a painter-poet in this picture." The discovery of two such works is an important event.

Commerce.

COTTON AND WINE IN ALGERIA.—A report by Consul-General Churchill says that in 1863, 7,455 acres of land were sown with cotton in Algeria, and the produce was 3,548,360 lbs., of which upwards of three millions were produced in the province of Oran, which appears to be better suited for this particular cultivation than Algiers or Constantine. The French government is making great efforts to increase its growth, and is granting a premium on the exportation of native cotton, calculated to allow the cultivator a reasonable profit. Without such a premium, even with the actual high prices, cotton could not be grown cheap enough. The expense attending the cultivation of cotton in Algeria is on an average £16 per acre for the first year, when the soil has to be prepared for this particular kind of cultivation, and £9 12s. per acre the following years. In 1863 eleven-twelfths of the cotton produced in the province of Algiers was Georgian long thread, and the remainder Louisiana short thread. But it appears that there is an objection to Algerian cotton, arising from its being generally badly sorted and cleaned, and the fibre is, moreover, knotty and deficient in strength. The cause of this last defect is supposed to proceed from the fact of the produce being ginned before sufficient time has been given it to ripen. The best qualities of the crop of 1863 were sold at Algiers at the rate of £5 16s. the cwt. of unginned cotton. In 1861, 13,745 acres of land were cultivated with the vine, and produced 3,835 tons of wine. In 1862, 16,062 acres were under cultivation, yielding 4,529 tons of wine, besides 20 millions of pounds of grapes. The wine produced is as yet, however, of an inferior quality. Its flavour is not unlike that of the sweet wines of Spain and Portugal, and it is very heady.

MAIZE SUGAR.—Monsieur B. Dureau, the editor of the *Journal des Fabricants de Sucre*, gives the following account of the attempts that have been made in France to extract sugar from maize:—"At the time of the continental blockade, when we were at war with England, and when France and a considerable portion of Europe besides was deprived of colonial produce, attempts were made to undertake on a grand scale the manufacture of grape sugar, and experiments were made with different plants in order to obtain sugar: the maize was one of these, and Parmentier pursued his researches in order to extract sugar from it: this, however, he only succeeded in doing in the form of non-crystallisable syrup. These researches are set forth in his work on the 'Manufacture of Syrup,' which bears the date of 1813. Ten years later, Marabelli, of Pavia, extracted sugar from the maize; then came Burget, Deyeux, Pictet (1811), Dr. Nenhold, Pallas (1824), Biot, and Sobeiran. But no part of these experi-

ments, so far as I have read, established the fact that a really crystallisable sugar could be made from maize; syrup only was extracted. In 1842, some experiments were made in Louisiana, which clearly proved that the sugar corn contained a large portion of crystallisable sugar, but I am not aware that they succeeded in practically obtaining any quantity. The extraction of sugar seems to present great difficulties. Nevertheless, M. Neuhold succeeded in extracting about 70 or 71 litres of juice from 1,000 maize stems; and from this he has extracted 12 lbs. of good syrup, and this again furnished him with 3½ lbs. of crystallised sugar, and 8½ lbs. of molasses. Whether this product deserved the name of crystallisable sugar, and whether it could stand a comparison with that which we get from the cane, I do not know. M. Lapanouse has repeated Neuhold's experiments, and from 100 lbs. of canes extracted about 9 or 10 lbs. of good syrup. M. Pallas could only get 360 grammes of syrup from 7 kilogrammes of maize cane—about a fourteenth part. That maize contains a considerable amount of sugar is evident, but at what particular period in the growth of the plant the sugar is crystallisable, and what quantity can be practically extracted from it, is the important point not yet resolved."

TEA IN CEYLON.—It appears that the cultivation of tea has been tried to some slight extent in Ceylon, and there seems to be no doubt that it can grow tea as well as Southern India or Assam. It is possible that in the course of a few years a fresh source of supply may be added to the numerous places of production which of late have contributed to swell our imports. At present the planters of Ceylon appear almost dependent on the cultivation of coffee.

ZANTE PETROLEUM.—A company has been formed for developing a valuable petroleum property in Zante, one of the Ionian islands. There are two valuable springs of it, which, there is good reason to believe, have yielded this product for more than 2,000 years. The historian Herodotus referred to these oil springs in the following terms:—"I myself have seen pitch drawn up out of the water from a lake in Zacynthus (Zante). At the place I speak of there are a number of lakes, but one is larger than the rest, being 70 feet every way, and two fathoms in depth. Here they let down a pole into the water, with a bundle of myrtle tied to one end, and when they raise it again there is pitch sticking to the myrtle, which in smell is like to bitumen, but in all else is better than the pitch of Pieria. (Note by Rawlinson—"The pitch of Pieria was considered the best in Greece.") This they pour into a trench dug by the lake's side, and when a good deal has been got together, they draw it off and put it up in jars." (Rawlinson's Translation, Book 4, Chapter 195.) Rawlinson adds "Zante still produces large quantities of mineral pitch." Dr. Chandler, writing before petroleum was known as an article of commerce, thus describes the "tar springs," as he calls them, of Zante:—"The tar is produced in a small valley about two hours from the town, by the sea, and encompassed with mountains, except towards the bay. The spring which is most distant and apt for inspection rises on the further side, near the foot of the hill. The well is circular and four or five feet in diameter. A shining film-like oil mixed with acum swims on the top; you remove this with a bough and see the tar at the bottom, three or four feet below the surface. * * * * We filled some vessels with tar, by letting it trickle into them from the boughs which we immersed, and this is the method used to gather it into pits, where it is hardened by the sun, to be barrellled when the quantity is sufficient. (Chandler's Travels, vol. 2.) The demand in Europe for petroleum, both for lubricating and lighting purposes, is rapidly increasing, as appears from the following quantities imported into Europe from the United States during the last four years, viz.:—1,194,682 gallons in 1861; 10,887,701 in 1862; 26,161,191 in 1863; 31,787,951 in 1864. Dr. Paul, in his report, states that as much as five barrels a

day may be collected from these wells, and Dr. John Davy, who visited the wells in 1824, states that one hundred barrels had been collected in one year. These estimates may both be far from the actual yield, since the material has hitherto been collected only at times when it happened to be wanted; but, without special arrangements for gauging the daily flow of petroleum from the wells, and without precise observations, extending over some time, it would be impossible to form a more accurate estimate as to the quantity of the spontaneous exudation. It is important, however, to remember that this exudation is to be regarded only as the index of a subterranean store of petroleum, and that it is certainly much more considerable than has been observed in the case of other abundant sources of petroleum, such as those of America, for instance, where the indications of the existence of petroleum consist merely in the greasy character of the water from springs, or the presence of a film of oil on the surface of stagnant water in the neighbourhood. Another circumstance connected with this exudation in Zante appears to be highly significant of the existence of a considerable subterranean source of supply. This is the very great length of time during which the large spontaneous flow above referred to has continued without any artificial aid. Thus the description of the wells, given by Herodotus more than 2,000 years ago, from his observation of them, is almost equally applicable at the present time.

Colonies.

AGRICULTURE IN VICTORIA.—The Legislative Council has published a return that throws some light on the disputed point as to whether the agricultural or the pastoral produce was of the greater value to the colony of Victoria. The returns show that the number of acres occupied by farmers in 1864 was 2,697,981, and by squatters, 31,683,306. The value of the agricultural produce raised in that year was £3,676,350, and of the produce raised by the squatters, £3,316,793. Thus the farmers raised a greater amount of produce than the squatters, and from less than a tenth part of the land, the year having also been a most unfavourable one for the farmers, as owing to a failure of the crops the yield of wheat was less than half of an average. The total number of persons engaged in agricultural pursuits, both male and female, was 41,313, and in pastoral pursuits, 9,724. The value of machinery used by the farmers, including one steam-plough and one steam-engine used for irrigation, reaping and threshing machines, &c., was calculated to be about £129,960, whilst the number of men in attendance on these machines was almost equal to the number employed by the squatters for all purposes. To the above amount of £3,676,250 should be added £1,186,716, the declared value of flour, wheat, &c., imported, to show the quantities required for the annual consumption of the colony.

KEROSENE IN NEW SOUTH WALES.—The discovery in this colony of mineral shale, producing kerosene oil, is more extensive than is generally supposed. A kerosene and paraffine oil company has already been established, and numerous truck-loads of their raw material are forwarded by rail to Sydney. The district of the Hartley appears to be very rich in this mineral. The examinations and experiments that have been made are said to justify very sanguine expectations. The extensive use of this shale in the manufacture of gas will improve its quality.

TIMBER TRADE IN WEST AUSTRALIA.—This trade is progressing favourably; all the stations are fully engaged in cutting timber, large orders having been received for exportation to South Australia, Calcutta, and Bombay. There appears to be ample encouragement for a great extension of cutting operations, and it is expected that the timber trade of this colony will greatly increase.

BRITISH PROPERTY IN VICTORIA.—The Customs returns show that four-fifths of the ships annually fre-

quoting Port Philip are the property of British owners, and that of their total estimated value, £4,770,000, £4,000,000 represents the interest that British merchants have in them. The cargoes brought by these ships from the United Kingdom and from British possessions are valued at £10,000,000, and the colonial produce they take away, consisting chiefly of gold and wool, is worth £9,750,000. Both the ships and cargoes are for the most part insured in British offices. The property of the banking and other financial institutions in Victoria is estimated at £10,000,000, and £8,000,000 of this amount may be said to represent British capital, whilst the stocks of British merchandises stored in the Melbourne warehouses are seldom of less value than £5,000,000—about sufficient for six months' consumption. It is feared that the clip of wool will be unusually light this season, the sheep having suffered much from scarcity of food; and the result of the lambing season is not satisfactory.

Publications Issued.

A RICHARD COBDEN. (Paris; folio.)—This volume is a splendid testimonial to the memory of Richard Cobden, furnished by several of his most intimate friends in France. The introduction is by M. Emile de Girardin, who sketches the services of Mr. Cobden during the last quarter of a century. M. Michel Chevalier contributes a long and minute biography of his late friend; and M. Castagnary has collected and arranged the expressions of sympathy which issued on the receipt of the sad news of Cobden's death from the press, the tribune, and the official world, including an autograph letter from the Emperor and one from Prince Napoleon. The volume is illustrated by a fine portrait of Mr. Cobden, and a figurative frontispiece. The Imperial letters, the biography by M. Michel Chevalier, and a long letter addressed to the latter by Mr. Cobden, are all printed in *fac-simile*, and the whole is executed with the greatest care, and printed on the finest paper. It is a memorial which the family of Richard Cobden must regard with deep though melancholy satisfaction. It is not often that one country pays such a tribute to the memory of the son of another.

LE PARTHENON. By M. Marchal. (Paris.)—M. Marchal, the author of an interesting book of travels in Senegal and China, has published at once a reproach and an appeal to the nations of Europe in favour of the artistic remains of ancient Greece. He complains not only that we despoil the classic land of the finest remains of her former glory, but that we do not aid her in preserving, and, as far as possible, reconstructing the temple raised by heracles to "Human wisdom, personified in Minerva." It appears that some persons have conceived the idea of converting the Parthenon into a dancing hall, and against such profanation M. Marchal protests energetically, and in his protest assuredly all lovers of art and all elevated minds will cordially join; but if the government of Greece cannot protect the monuments of her own glory, there is not much probability of other nations doing for her what she does not exhibit an inclination to do for herself. On the other hand, the manifestation of a desire to preserve the Parthenon and other ruins would doubtless soon induce others to aid in the work.

GUIDE THEORIQUE ET PRATIQUE DE L'AMATEUR DE TABLEAUX. By T. Lejeune. (Paris. 8vo.)—The appearance of the first and second volumes of this work was noticed in the *Journal* of the 9th of December last. The third and concluding volume has recently been issued. It contains an alphabetical list of the painters of all schools, from the earliest period to the present time, about one thousand in all, with the place and dates of birth and death, males with prices of important pictures, and for information not included in the body of the work.

The remainder of the volume is occupied by an alphabetical list of signatures, monograms, and marks of artists, executed in *fac-simile*, probably the most complete yet published. M. Lejeune had peculiar advantages in the construction of this table; he is one of a family of artists and collectors well known in the arts for a century, and the present list is the result of the labour of his predecessors, enlarged and corrected by himself during his long experience as restorer of pictures in the Imperial galleries of France, and as conservator of several very important galleries, including those of Duchâtel, Fould, de Morny, and Soult, and from his researches abroad. As an instance of the corrections may be mentioned that of the name of a well-known artist, which has usually been written Memling, but which M. Lejeune clearly shows to have been Hemling, the error having arisen from a peculiar form adopted by that painter for the initial letter of his name. The careful execution of the blocks of these monograms and signatures gives great value to the work.

Notes.

PARIS EXHIBITION OF INSECTS.—This curious exhibition has attracted the attention of men of science and agriculturists, but most particularly of those who are interested in the rearing of bees and silk worms, which naturally occupy the chief places. The collection of bee-hives, some shown in operation, and of other matters connected with the rearing and management of these interesting insects, is considerable, and presents forms, in some instances, strange to English eyes. In addition to the bees themselves and the material referred to, are specimens of their products and of the articles into which they enter, such as honey, wax, mead or hydromel, sweetmeats, and confectionary. The largest portion of the exhibition, however, was occupied by matters connected with the production of silk. An admirably arranged collection was shown by M. Jules Rieu, of Valréas, in the department of Vaucluse, including the white and yellow cocoons of the Japanese silk worms, introduced into France in 1863, and extensively bred by M. Rieu; green cocoons also from Japan, introduced in the present year; silk spun from these various cocoons; models of the frames and other material used in the silk cultivation; and specimens of the insects themselves in the various stages of their existence. M. Guérin-Meneville, M. H. Givélet, and others, exhibited numbers of the *Bombyx cynthia*, and of other worms produced by the crossing of the former with the *Bombyx arrindia*, feeding on the leaves of the alanthus, and also several chambers containing cocoons and hundreds of enormous moths depositing their eggs. Others show products, preparations and sketches of the *Bombyx yama mai*, a very large green worm that feeds on the oak, and of many other new and curious species. But the alanthus worm seems to have attracted the greatest attention, and its cultivation, as already stated in the *Journal*, is rapidly extending. M. Givélet, who published a report on the subject not long since, read a paper at the exhibition some time since, and promises a more complete account of the best method of bringing this worm into cultivation on a large scale during the coming winter. This gentleman commenced planting the alanthus at the Chateau of Flambouin in 1860, and, after some misfortunes and disappointments, completely succeeded in the breeding and rearing of the worms. He reports that during the present season he has collected about twenty thousand cocoons, and that about three times that number are now on the trees in his plantation. The museum of Natural History, at the *Jardin des Plantes*, contributed a fine collection of insects, with specimens of timber and other substances which have suffered from their ravages; also some remarkably large specimens of lobsters, and crayfish from American waters. Another remarkable collection of insects is from Mr. T. Glover, the entomologist attached to the Department of

Agriculture at Washington. M. E. Mocquerys, of Evreux, has an admirable exhibition of coleopterous and other insects which feed on the vine, cereals, and other industrial plants. Dr. Eugène Robert contributed a series of sections of trees ravaged by xylophagous insects, together with illustrations of the methods which have been adopted by the authorities of Paris and other places, under his superintendence, for their destruction. There were other collections of more or less importance, and, amongst the curiosities of the exhibition, a landscape produced entirely by the arrangement of various coloured beetles. Apparatus and powders for getting rid of certain classes of noxious insects were numerous in the exhibition, amongst which, judging from the number of medals and awards granted to the discoverer, the powder produced from the flowers of the *Pyrethrum Willemoti* seems to hold the highest place. It appears that the flowers of various plants of this family are extensively used in Persia, Armenia, and other countries, for like purposes. The Persian powder is said to be composed chiefly of the flowers of the *Pyrethrum carneum*, while the Armenians prefer the *Pyrethrum roseum*.

GREAT AQUEDUCT.—The conveyance of the waters of the river Dhuis to Paris ranks amongst the most important public works of its class, and, being just completed, a short account of the undertaking will not be uninteresting. The object is the increase in the supply of the amount of water for the consumption of Paris, and especially that of the higher levels of the city. The aqueduct of the Dhuis, or Dhuy, commences at Pargny, in the Aisne, and traverses the departments of the Seine-et-Marne, Seine-et-Oise, and Seine, its total length being about 135 kilomètres, or upwards of eighty English miles; the whole is constructed in solid masonry, with a fall of about seven inches in the mile, with the exception of about nine or ten miles, where the waters are carried through valleys by means of cast-iron syphon pipes, fifty-five inches in diameter, and having an average inclination of rather more than thirteen inches to the mile. The stone aqueduct lies underground throughout about six miles of its course, four of the principal tunnels being from eight hundred to upwards of two thousand yards in length. Four of the syphons are from a thousand to nearly five thousand yards long. The aqueduct was commenced in June, 1863, and completed last month, and the total cost, including indemnities to the proprietors of land, is said to have amounted to between £600,000 and £700,000. In the afternoon of the eleventh of the present month, the waters of the Dhuis arrived at the entrance to the great reservoirs of Menilmontant, described in the *Journal* of March 10th and April 21st; and in a few days, when the aqueduct and syphons are completely cleansed by allowing the water to pass directly through them into the sewers, the reservoirs will be filled and the service commenced. The Dhuis aqueduct is calculated to furnish about 40,000 cubic mètres of water in twenty-four hours, and that of the Marne with other supplies now brought to Paris, about four times that quantity, or 200,000 cubic mètres in all per day. Some idea of the magnitude of these works may be formed from the fact that the stopcocks or valves which close the main supply-pipes at their junction with the reservoir weigh more than four tons each. The pipes themselves are more than thirty-nine inches in diameter, and the valve or stopcock consists of a disc of cast-iron, which is set in the direction of the length of the pipe, or transversely, according as the water is to be turned on or off.

CANTOR LECTURES.

"ON SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS." By
DR. F. CROCE CALVERT, F.R.S., F.C.S.

LECTURE III.*

DELIVERED ON TUESDAY, THE 18TH OF APRIL, 1865.

On the Discoveries in Physiological Chemistry.

I intend in this lecture only to give you a general outline of some of the main facts connected with the phenomena of digestion and respiration, introducing as I proceed some of the most important chemical facts connected with that branch of science discovered or observed within the last two years. To enable you to appreciate more fully the importance of those discoveries, I shall divide my lecture under two principal heads:—First—the studying with you those facts which have a special reference to digestion and respiration; and secondly—those which have a more immediate connection with the human system in their direct action as therapeutic agents.

DIGESTION.—Man requires several varieties of food to maintain the health and strength of the body. One of the most important of these is atmospheric air, which is chiefly used to maintain the heat of the body so essential to vitality, by oxidising the various substances taken as food, or by oxidising the tissues which have been destroyed in the body by the wear and tear of life, and which, having fulfilled their functions, require to be removed, that new tissues may replace those which have disappeared.

The next class of food which man requires are fluids, which are chiefly represented by water, either pure or mixed with other substances, and which fulfil in the body two principal functions—that of carrying into the stomach and the intestines various nutritious elements which have been taken as food, and conveying them into the blood by endosmosis, or the force called by Mr. Thomas Graham, the master of the Mint, "diffusion."

The second purpose which liquids fulfil in the human system, is to remove from the blood those various substances which have been acted upon by the atmosphere, as above explained, or others which have been produced by the action of vitality, and which require also to be removed from the system to enable it to be in a normal state.

Again,—Man requires various mineral matters, but these must be of a peculiar nature, so as to render them fit to fulfil in the organism the different functions to which they are adapted. Thus we find that man requires soda, potash, lime, manganese, iron, chlorine, sulphuric acid, phosphoric acid, and other mineral elements of minor importance. No doubt that for man, as for plants, the nature and the relative proportions of the mineral matters entering into the food which he takes are most essential; for if in that food a sufficient amount of salts of soda were not present, one of the essential elements of blood would be wanting. If phosphate of lime is not supplied in due proportions, the frame-work of his body will suffer. The same may be said of the importance of carbonate of lime in the water which he takes as a beverage; and, therefore, it is yet a question to be solved by experience, whether the extremely pure water which is now introduced into several of our principal cities, such as Manchester, Glasgow, &c., so agreeable to the general feelings of the public, under the impression that it is pure water, and which confers such benefits on manufactures in general, will not, in course of time, prove detrimental to the health of the inhabitants, owing to its extreme purity, not containing carbonate of lime, which is so essential to the formation of bone in man and animals.

The fourth class of food that man requires may be called heat-producing or respiratory food. This food is chiefly assimilated and employed by him to maintain the heat of the body, through the action of the oxygen of the atmosphere, and which, being dissolved by the blood, circulates with it, and burns or oxidizes its carbon, converting it into carbonic acid. This class of food is mainly represented by starches, gums, sugars, oils, fatty matters, and several other substances, such as pectic acid, pectoses, &c.

The fifth class of food is flesh or blood-forming food, which is employed in the system to replace the various animal tissues which have fulfilled their functions, and which are modified and altered by the action of the oxygen of the atmosphere as above explained, or are destroyed by the wear and tear of life, and which leave the system principally in some modified state, by means of the fluid taken as a beverage. This class of food is represented by fibrine, albumen, caseine, and other similar nitrogenated substances, which we find compose in a great measure flesh, blood, milk, and other similar foods.

As it is impossible for me, in the course of one lecture, to give you a correct idea of the chemical phenomena involved in the digestion of the five various classes of food to which I have referred, I must confine my observations to the digestion of the two last classes of food, namely,

* Lecture II. will appear in a future number.

the heat-producing foods, and the flesh or blood-forming ones. The blending of chemistry with animal physiology has thrown much light on the phenomena of digestion; in fact, until chemistry had investigated many of the actions which take place in the digestion of foods, much obscurity existed, and many empirical views were promulgated on these important and essential functions of life. But since chemistry has penetrated into this branch of science, it has brought to light many facts which could not be understood or satisfactorily explained until the chemical facts connected with digestion had been well studied, and much light thrown on the complicated phenomena.

Although I do not agree in the opinion entertained by some persons that the phenomena of digestion are purely due to chemical actions, on the other hand I am of opinion that they cannot be regarded as entirely due to the force called vitality. My opinion is that the phenomena of digestion are due to the simultaneous or successive actions of vital and chemical forces. Thus, for example, the secretion of the various fluids necessary for digestion is due to vitality, and the influence of the fluids secreted on the substances taken as foods is due to chemical action, or, in many instances, to actions not yet well understood, but which still come under the head of chemistry, namely, purely chemical fermentation. I understand by this term the peculiar conversion or unfolding which certain substances undergo by the presence or contact of minute quantities of other substances, such, for example, as the conversion of starch into dextrine and sugar under the action of the peculiar ferment called diastase, or the unfolding of amygdaline into hyduret of benzoil, prussic acid, &c., under the influence of a ferment called emulsine. But we must bear in mind that this class of fermentations are perfectly distinct from those which I described to you in the last lecture of my course delivered in 1864, which fermentations referred to those which are determined or produced in consequence of the development in the fluids of certain microscopic vegetables or animals which, by their peculiar mode of growth or life determined the changes which are observed in many vegetable and animal fluids when in a state of fermentation or putrefaction.

With these explanations I shall now proceed to state that there are five principal fluids which are essential to digestion, and which are secreted by various organs which participate in the actions which take place during digestion, and these are:—1, *Saliva*, which is secreted by certain glands in the mouth; 2, *Gastric juice*, secreted by the membranes of the stomach; 3, *Pancreatic juice*, secreted by a gland situated just beyond the outlet of the stomach; 4, *Bile*, secreted by the liver; 5, a *Gaseous medium*, called atmospheric air.

Let us now examine how and to what degree each of these fluids acts upon the two special classes, and which I have stated are blood and heat-forming foods.

ANIMAL FOOD.—When meat, for example, is taken as a means of subsistence, although it is divided into small pieces by mastication, and gradually brought into the form of a ball, so as to pass with facility from the mouth into the stomach, still it undergoes no chemical change by the mixing or imbibition of the saliva. But when it arrives in the stomach, it meets here a very acrid fluid called gastric juice, the acidity of which is due, not to hydrochloric or acetic acids, as was formerly stated, and which are now attributed to indigestion, but to the presence of phosphate and lactate of lime, together with a little free lactic acid, which acid elements are essential not only to the action of the ferment called pepsine, but also facilitate its solution. This pepsine acts in a most remarkable manner, for a minute trace of it appears to have the power to liquefy, if I may so express myself, the solid substance called nhrine, and to alter its conditions. In fact, all the solid animal elements of food become fluid under the action of the gastric juice, and are transformed into the fluid mass which has received the name of albuminose or

pectose. The animal matter so transformed is susceptible of being absorbed either by endosmosis or diffusion by the coats of the stomach, but the greatest part of it passes on into the small intestines, where it meets the bile, and where the acidity of the fluid is neutralized and it becomes alkaline owing to the alkaline state of the bile. This transformation of the acidity of the gastric juice into an alkaline character, is essentially owing to the fact that during its passage through the small intestines it is in a fit state to be absorbed by the mucus which coats those vessels of the human organism, and to come in contact with the blood, which is always in an alkaline condition. Further, we know that organic matter in an alkaline condition enters more rapidly into decay and decomposition, so that it is thus in a fit state to be rejected by the body. Therefore, in the digestion of animal matter, we may consider there is only one active fluid which participates in it, namely, gastric juice, pancreatic juice and the bile only acting as alkaline fluids to bring it into a proper state to be absorbed by the mucus, and to be carried by the blood into the torrent of circulation.

Here I must pause in my description of digestion to make you acquainted with some of the recent discoveries which tend to prove that gastric juice does not simply liquefy fibrine and caseine, but that it acts also on albumen in such a way as to modify its molecular condition, and thereby its chemical properties. If the albumen of an egg be injected into the jugular vein it passes unaltered to the blood, for it is found in the secretions of the kidneys; but if the same be injected into one of the ramifications of the portal vein, then it has to pass through the liver, and therefore through the torrent of the circulation of the blood, and it is then so modified that it becomes assimilated and cannot be traced in the secretions of the kidneys. It follows that albumen of the egg must undergo a molecular change to render it fit to become assimilated, and we may assume, therefore, that it experiences the same change in the stomach under the influence of the ferment, called pepsine. But I cannot conclude this part of my subject without calling your attention to some interesting researches lately published by Mr. Smee. Until the publication of those researches, although scientific men had assumed that there must be an identity between albumen, fibrine, and caseine, which are the chief elements representing animal food, still they had not been able to demonstrate their convertibility one into the other. Now Mr. Smee has accomplished that fact; or, in other words, has reversed the theory previously entertained as to what takes place during digestion; for he has established that fibrine, or the clot of blood; caseine, or the curd of milk; and albumen, the serum of blood, are convertible into one fluid, which he has called albumenose, or pectose. Mr. Smee has succeeded, I say, in reversing the problem, and has shown that albumen may be converted into fibrine, and probable caseine. To effect this interesting change he proceeds as follows:—He passes a current of pure oxygen gas through a solution of albumen of blood or egg, slightly acidulated with acetic acid, and at a temperature of blood heat, or of 98° to 100°, and after several hours a mass of fibrine appears, the production of which is facilitated by bringing into play the action of an electrical current. Instead of an acid solution of albumen, Mr. Smee employed a weak alkaline solution of the same substance. It became transformed into a peculiar substance which I described to you in my last year's lecture, under the name of chondine. But I would strongly recommend to all lovers of animal physiology to read the interesting papers which have been published by that gentleman in the Proceedings of the Royal Society, 1864 and 1865.

FATTY MATTERS.—Allow me now to have the pleasure of calling your attention to the modifications which fatty matters have to undergo when taken into the human system, before they are prepared for assimilation. Most physiologists maintain, at the present day, that these substances undergo a change during their retention in the

mouth or their passage into the stomach, but Dr. Marcet is of opinion that fatty matters undergo a certain modification during their passage from the mouth to the entrance of the small intestines. At all events, there can be no doubt, from the researches of some of the most eminent physiologists, that fatty matters undergo a most important change when they arrive in contact with the fluids secreted by the gland called the pancreas, which transforms them into an emulsion, but does not saponify them. The matters so emulsified are then further acted upon by the bile, and finally are absorbed by the lacteal vessels, and carried into the circulation of the blood. It is the absorption of fatty matters by the lacteal vessels which deceived the physiologists of an earlier date, and led them to believe that that white substance was the absorption of the nutrient parts of food, to which they gave the name of chyle, and which, according to them, gradually became transformed into the element of blood. Fatty matters so absorbed and carried into the torrent of the circulation of the blood fulfil two purposes—either they are consumed through the oxidation of the oxygen contained in the air inspired, and thus they help to maintain the heat of the human body, or they are stored up with the view of supplying the elements necessary to the maintenance of the heat of the body, when, through disease, the body has ceased to take its ordinary external nourishment. In fact, we may consider these fatty matters to be to the body what the coal-fields of England are to its manufactures.

Another division of the heat-forming or respiratory foods is that to which I have already referred, and which includes starch, gum, and sugar, and the transformations which these peculiar substances, and especially starch, undergo in order to become assimilated. Allow me to claim your undivided attention to the facts which I am now going to bring forward. When bread, potatoes, or any amylaceous substance, arrives in the mouth, it gradually becomes mixed and saturated with saliva—1st, the saliva of mastication, which is secreted by the parotid glands, and serves only to coat the mass of food called the ball, and so facilitate its passage into the stomach; 2nd, the saliva which is secreted by the sub-maxillary glands, a thin, watery fluid, which acts chemically on the food, converting the insoluble starch into soluble elements called dextrine and sugar. The amylaceous substance thus acted on passes into the stomach without further action, but when it arrives in contact with the fluid secreted by the pancreatic glands, there it undergoes a complete change; for the pancreatic fluid, called by the Germans the intestinal saliva, completes the conversion into dextrine and sugar of such portions of the starch as have not been acted on by the saliva of the mouth. For both these fluids are alkaline, I mean the pancreatic fluid and the saliva from the sub-maxillary glands; for that secreted by the parotid glands is acid, and this explains why the saliva is always acid in the morning or before man has taken food. I say that these fluids are alkaline, and they contain a ferment called diastase—a ferment identical with that which exists in malt, and which converts in the brewer's vat its mash into a saccharine fluid, which ultimately becomes beer. The starch so converted into dextrine and sugar through the action of the diastase of the saliva and of pancreatic fluid is absorbed by the mucus of the small intestines, and conveyed by the small veins which line those organs into the *vena porta*, and thence into the liver. This important organ fulfils several functions. First, it secretes bile, an alkaline fluid, which, as we have seen, acts as a neutraliser of the acid fluids arriving from the stomach, converting them into an alkaline condition fit for decay. Secondly, it is an eliminating organ, for the bile appears to contain some of the elements which require to be removed from the blood, and which have been produced through the wear and tear of life. Further, it contains some of the elements of the colouring matter of blood, for the colour of bile and that of the

blood appear to have a resemblance. But the most important substance which the liver contains is a peculiar ferment, discovered by M. Claude de Bernard, which has the power to transform the insoluble substance which he calls glycogen into a soluble one, namely sugar. Thus it would appear, from the researches of that eminent physiologist, that the amylaceous substances absorbed as food, and acted on as above explained, arrive by the *vena porta* in the liver, and there are stored until required by man to maintain the heat of his body and the phenomena of life. He has observed—and the results at which he has arrived have been confirmed by O. G. Lehmann, another eminent physiologist—that there is comparatively only a small amount of sugar in the blood when it passes into the liver by the *vena porta*, whilst the same blood, when it leaves the liver by the hepatic veins, contains a comparatively large quantity. Thus Lehmann has found that the quantity of sugar in the *vena porta* blood amounts to from 0.21 to 0.30, whilst in the hepatic veins the quantity is from 0.87 to 0.98; and that the hepatic blood so charged with sugar first passes into the right ventricle of the heart, then into the lungs, thence into the left ventricle of the heart, whence it is driven, by the contraction of that organ, into the torrent of circulation. I say “the torrent of circulation,” and as perhaps few persons are aware with what rapidity blood circulates through the human system, it may be interesting to state that every time the heart contracts, about three ounces of blood are driven out, and as there are about sixty pulsations of the heart per minute, the consequence is, that the 33 lbs. of blood which is contained in the body of an adult passes through the whole of his system—lungs, heart, kidneys, liver, and even through the most minute capillary vessels—in the space of three minutes. The knowledge of this fact will explain how small quantities of matter coming in contact with the blood may produce a most injurious action on the system—how, for example, the smallest quantity of strychnine, curarine, prussic acid, and other such substances, can act upon the blood, modify its nature, and produce death in a few minutes.

The curious substance called glycogen by Claude de Bernard was extracted by him from liver, by the following process:—The liver of an animal recently killed was cut into thin slices and thrown into a small quantity of boiling water. The whole was allowed to boil for an hour, and was then submitted to pressure. A small quantity of fluid was obtained, which, when treated by alcohol, yielded a white flocculent precipitate, and this, when re-dissolved in water, and re-precipitated by alcohol, was then found to yield with iodine and other re-agents the characteristic properties of amylaceous substances. Although glycogen exists in larger quantities in the liver when man or an animal takes a large quantity of amylaceous substances as a part of food, still this substance is found in the livers of carnivorous animals, showing that under the force called vitality animal matters are susceptible of undergoing the chemical change which converts them into a substance similar to starch. But this glycogen gradually disappears from the blood as it passes from the hepatic veins into the heart, and lastly through the torrent of circulation, for the oxygen of the atmosphere rushes into the lungs by inspiration, gets into contact with the blood in the numberless cells composing them, and by its action upon the glycogen helps to convert it into water and carbonic acid gas, which are thrown out by expiration. Now, although this conversion of the glycogen proceeds during the whole of the circulation of the blood, still there can be no doubt that the greatest portion of it is converted into gaseous elements when it comes in contact with the oxygen of the air in the cellular tissues of the lungs, for much less glycogen is found in arterial blood than in that of the hepatic veins.

To smooth the pathway of the reader to the perfect understanding of the above statement, it is perhaps necessary to add that when the blood leaves the liver it travels

through the hepatic veins into the right ventricle of the heart; that by the contraction of that organ the venous blood is thrust into the lungs, where it comes in contact with the oxygen of the atmosphere, and is converted from the dark purple colour which characterises venous blood into a brilliant red coloured fluid, called arterial blood. Having undergone that change, it runs thence into the left ventricle of the heart, and having filled it, that organ contracts itself, and drives the blood with great force through the whole of the arterial system, and during its passage through the capillary vessels it gets converted gradually into venous blood, which reaches through the various veins the *veina porta*, and this conveys it to the liver. Thus we can perceive how the blood constantly flows in a circular motion through the whole of the human system. At all events, before proceeding with the few remarks I have to offer on respiration, and calling attention to recent discoveries which have been made in connection herewith, allow me to state that Lehmann has published the following data respecting the action of the liver on the various elements contained in the blood. He has found that there is much more fibrine in the *veina porta* than in the hepatic veins; that albumen is more abundant in the portal than in the hepatic veins; that fatty matters are in larger quantities in the portal than in the hepatic; that globulin, or the substance which represents the globules of blood, is in less quantity in the portal than in the hepatic; whilst the colouring matter, called hematozine, is in larger quantities in the portal than in the hepatic. This, according to Lehmann, explains why we find colouring matters in bile, which may be considered as modifications of the one existing in blood, and which are found only in that fluid.

Although it is impossible in a lecture like this to attempt to give a correct idea of all the phenomena connected with respiration, and all the data which bear upon that important function of life, I may be permitted to give a few data, which will enable you, I hope, to have a general idea of the present theory of respiration. Man inspires about thirty times a minute, and at each inspiration there rushes into his lungs about a pint and a-half of air, which penetrates into the myriads of cells composing the lungs, and comes in contact there with the blood, as above stated, which it converts from venous into arterial. At the same time a certain quantity of air, or oxygen, is dissolved, which not only effects the above conversion, but displaces from the venous blood a certain quantity of carbonic acid, which it contains. Thus it is found by experience that one hundred parts of air that man inspires, contains, in round numbers, 21 parts of oxygen; whilst the gases he expires are represented by 16 parts of oxygen, four parts of carbonic acid, and one part of oxygen which has been transformed into water, thus making up again the 21 parts of gaseous matter in the 100 which he inspired. But the production of this carbonic acid is chiefly caused by the action of the oxygen dissolved in the arterial blood during its passage and contact with the animal tissues and the glycogen existing in the capillary vessels; for it is there that we observe the change of blood from arterial to venous, the conversion from venous into arterial being, as above stated, in the lungs.

Several theories have been promulgated by chemists and physiologists as to how the oxygen acts to convert venous into arterial blood. Liebig assumed that the blood dissolved oxygen as water dissolves that gas and others; and he explains the greater solubility of oxygen in the blood than in water, by asserting, and that on experiment, that phosphate of soda, which exists in blood, facilitates the solution of oxygen in that fluid. Dumas states that it is the iron which exists as one of the elements of the colouring matter of blood, called, as above stated, hematozine, which fixes the oxygen in the arterial blood, and yields it again to various organic matters, either those originating from glycogen or those resulting from the wear and tear of life, and which may be con-

sidered as refuse matters which require to be removed from the system. The iron thus becomes deprived of its oxygen, and is ready to reabsorb a fresh quantity when it comes again in contact with the oxygen of the atmosphere in the lungs.

These theories do not appear, so far as I am aware, to have received the general sanction of physiologists; and I therefore deem it to be my duty to call your attention to some interesting optical researches, due to that eminent *savant*, Professor Stokes, of Cambridge. That gentleman has observed that when a small quantity of blood is mixed with water, and the whole poured into a small tube, and this, in its turn, placed in such a position as to allow a ray of light to pass through the blood solution, and that the ray of light is made to pass through a prism, he finds that the spectrum so produced has undergone certain modifications, which consist in the fact that certain lines or colours of the spectrum have disappeared; and he, moreover, observes that these "bands of absorption" as he calls them, are characteristic, for they differ according as the blood placed with the water in the tube is arterial or venous, and so delicate is this mode of investigation that he can discern the slightest modifications which blood undergoes. In fact, I may state *en passant* that he has applied this mode of investigation to distinguish vegetable and animal matters, which, though having a great similitude, become distinguishable by the simple mode of applying optics to their investigation.

Coming back to blood, I may state that the researches of Professor Stokes on the action of oxidising agents on blood, have thrown much light on the phenomena connected with the conversion of venous into arterial blood. He has remarked that if arterial blood is shaken with an alkaline solution of sulphate of protoxide of iron, or perchloride of tin, it assumes the dark colour of venous blood, and that if he then agitates the same dark purple blood with air, it absorbs the oxygen, becomes oxidised, and therefore, is converted into red arterial blood.

These facts, joined to many more which can be found in the proceedings of the Royal Society, for 1864, have led Professor Stokes to the conclusion that the colouring matter of blood is the real carrier of oxygen; that it absorbs oxygen and becomes scarlet; and that it yields its oxygen to organic substances during its circulation through the system, and becomes purple or venous blood. He has given to the colouring matter of blood the name of *cruciorine*, and calls it purple or scarlet *cruciorine* either as it exists in the veins or arteries.

I think it is useless to repeat here many facts connected with this subject, and which I brought to your notice in my last year's lectures.

URINE.—Having also dwelt in my last course to some length on the principal elements contained in this important secretion, I deem it my duty merely to call your attention to one or two facts of some immediate importance which have been published since then. One of these is due to Dr. Marcey, who has found in that secretion a substance which, until his investigations, had been unnoticed by chemists. I mean an amorphous or non-crystallizable acid, which he calls colloidal acid, from the circumstance that it cannot pass or diffuse itself through animal membranes. I may here mention that substances in general, according to the theory of Mr. Thomas Graham, the master of the Mint, may be divided into two classes, namely—those which crystallise, and which he calls crystalloids, and those which do not diffuse, and which he calls colloids, from the French word *colle*, or glue. Dr. E. Morin has also published some elaborate researches on the relative proportions of oxygen and carbonic acid in urine, and the following table will show you the influence which exercise has upon the combustion of organic matter through the oxygen conveyed in the blood by the *cruciorine* of Professor Stokes, converting the organic matter into carbonic acid, for this gas is found, as you will see, more abundantly in the urine of man when in a state of activity than when in a state of repose:—

GASES IN THE SECRETION OF THE KIDNEYS.

Quantities of Gases in 100 Parts of Urine.	Composition of the Gases.	Activity.	Repose.
From 2·62 to 3·61	Carbonic Acid ...	73·56	62·93
	Oxygen ...	1·65	1·89
	Nitrogen ...	24·79	35·18
		100·00	100·00

I wish now to invite your consideration for a few minutes to some interesting facts which have lately been published by Dr. H. Bence Jones, on the extraordinarily rapid absorption of certain substances into the animal system. He has observed that substances, such as lithium and rubidium will be found to have passed into the whole of the human system three or four hours after they have been administered, either as medicines or as a matter of experiment. In fact, he has found that the absorption is so complete that he has been able to detect their presence in the non-vascular textures of the body; and what enhances the interest of his researches is, that he employed, as a means of analysis, for the detection of these substances, the property which they have of communicating colour to flame, and therefore applied to their detection the spectroscope of Bunsen and Kirchhoff.

Whilst on the subject of the rapidity of the absorption of matter by the body, I may state that a French physiologist has observed that certain saline matters, such as iodide of potassium, nitrate of potash, or acetate of morphia, will pass in a few seconds through the whole of the system. Thus he was able to detect the presence of iodide of potassium in the urine three minutes after it had been taken by the mouth. But certainly one of the most curious instances published of late respecting the absorption of organic matters in the system is that related by Dr. Letheby, and which tends to prove the correctness of statements which have been published in former times, that certain chemists or persons had a secret of producing poisons, the action of which only became manifest a long period after they had been administered. Thus, Dr. Letheby states, in a paper which you will find in the "Proceedings of the Royal Society," and which contains some of the facts which he gave in evidence at a coroner's inquest in London, that the death of a person ensued twelve months after he had taken the substance which caused death. A man engaged in a large chemical works in London had inspired, during his labours, a comparatively small quantity of a substance called nitro-benzene (now sold under the name of oil of bitter almonds, and used in large quantities for perfumery, and also for giving taste to various culinary preparations), and that this substance had gradually become converted into aniline (a substance now extensively used to produce colours, and also procurable from coal tar), and had been the cause of the death of the man.

I would invite all lovers of animal physiology to read with attention the researches of M. Claude de Bernard on the physiological action of curarine, or the active principle of the curore, or the poisonous mixture used by the Indians at Madagascar, and on the banks of the river Orinoco. These researches will be found in several articles published by him in the *Revue des Deux Mondes*, 1864; and, to excite your interest in reading the articles, I may state on his authority that the death which ensues by the injection into the blood of a trace of this poison may be considered as the most curious and distressing that can be conceived, and, he further states, that the physiological phenomena which are witnessed during the process of death may lead to the most beneficial application of the substance as a therapeutic agent.

Although time is pressing, I cannot part from you this evening without calling your attention to the fact that every day we are realising the cherished ideas of

the alchemist, and of the medical men of the fifteenth and sixteenth centuries, who laboured, the one to extract from substances what they called the quintessence of them, and the other to apply what they supposed then to be such quintessences. From the imperfect state of science, chemistry included, at that time, they were unable to carry out what they conceived to be essential to arrive at a better and more enlightened treatment of disease. They perfectly felt that the extracts or infusions of the plants they had at their command had not a defined action in their treatment. All men of science know with what enthusiastic perseverance Paracelsus advocated the employment of quintessences; and, although in his enthusiastic mind he went so far as to pretend that he carried in the head of his cane the elixir of life, there is no doubt that he and his disciples left a germ, which has gradually grown to be a plant, and that the chemistry of the present day is gradually succeeding in extracting from plants their active principles. Although medical men were convinced of the utility of employing the active principles existing in plants, as quinine, cinchonine (from cinchona bark), morphia (from opium), &c., still we had not a correct idea of the various actions which these diverse alkaloids exerted on the system. We are, therefore, much indebted to M. Claude de Bernard for his admirable researches on the therapeutic action of the alkaloids of opium; and owing to his extensive physiological knowledge, as well as his perfect mode of carrying out his experiments, he has proved that we can class the action of the alkaloids of opium under three heads, as shown by the following table:—

THE ALKALOIDS OF OPIUM.

SOPORIFIC.	CONVULSIVE.	TOXIC.
Narcotia.	Thebala.	Thebala.
Morphia.	Papaverine.	Codala.
Codala.	Narcotina.	Papaverine.
	Codala.	Narcotia.
NOT SOPORIFIC.	Morphia.	Morphia.
Narcotina.	Narcotia.	Narcotina.
Thebala.		
Papaverine.		

These researches thoroughly prove the correctness of Paracelsus's views, showing that in the employment of opium due consideration should be given to the fact that in that opium there are various agents acting in a defined manner upon the organs of his the patient.

I cannot conclude this lecture without drawing your attention to several interesting papers which have been published by Dr. Polli, of Milan; Davanne, Rayer, and Le Mare, of Paris, tending to prove that the source of many diseases, especially those a contagious nature, may be due to the sporules, or germs of certain animal or vegetable ferments which penetrate with the air into the system, coming in contact, as it does, with the blood in the lungs of man. The difference between the views of these gentlemen and those who preceded them is that formerly these statements were merely theoretical, whereas these gentlemen, by the aid of the powerful microscopic instruments now brought into use, have been able to trace the presence of vegetables or animals in blood either of animals or man affected with certain classes of disease. I may cite as an example the discovery in the blood of the carbuncle, of the presence of vitrios and bacthera. (Royer and Davanne.) These facts explain why these gentlemen have applied with such success the most powerful antiseptic agent yet known in the treatment of that disease, namely, carbolic acid, and there is no doubt in my mind that the spread of either scarlet fever, typhoid fever, cholera, or any diseases arising from the decay of blood or its decomposition is brought about by the introduction into the blood of certain ferments which completely alter the nature of that fluid, as in the case of the carbuncle and similar diseases. If these views are correct—and I think I

am justified in saying that they have the support at the present day of some of the most eminent men on the continent—the employment of carbolic acid, either to prevent the spread of, if not to cure these diseases, deserves the attention of the medical world.

PARIS UNIVERSAL EXHIBITION OF 1867.

The Minister of State, Vice-President of the Imperial Commission, has just issued the articles relative to the Scientific Commission referred to in the general scheme of the Commission.

Article 1.—An International Scientific Commission is established in connection with the Imperial Commission, and has for its objects:—

1. To point out the means by which the recent progress has been made in the sciences, the liberal and the ordinary arts.
2. To aid in the propagation of useful discoveries, and in inducing reforms in matters of international interest, such as the adoption of the same weights, measures, scientific units, &c.
3. To point out, by means of special publications, the results, of general utility, which may be derived from the Exhibition, and, if necessary, to take measures for their completion.

Art. 2.—The Scientific Commission to consist of natives of France, named by the Imperial Commission, and of foreigners nominated by various countries. These nominations will be duly announced from time to time.

Art. 3.—Scientific bodies, and, in general, those who interest themselves in the progress of the sciences and arts, are invited to submit to the Imperial Commission their advice on the means to be adopted and the questions to be examined.

Art. 4.—The members of the Scientific Commission will not be required to attend any periodical meeting. They may work out alone the subjects which they are charged to treat upon, and remit the result of their labours to the Imperial Commission in their own name. At the same time they may act in concert with their colleagues if they think fit.

Art. 5.—The memoirs and reports will be submitted to the Imperial Commission before the 1st of July, 1867, and published, if found advisable, by its authority. These memoirs and reports will together form the works of the Scientific Commission.

The preparatory works of the Exhibition have been commenced; a number of workmen are now engaged in forming the ground-work of the grand avenue, a hundred feet wide, which will traverse the entire space of the Champs de Mars, from the quai to the Ecole Militaire in the rear. The ground is also being prepared on the Quai de Javel for the railway which is to place the Exhibition in communication with the whole of the grand lines of France by means of the Chemin de Fer de Ceinture and the Anteuil line.

Amongst the various objects of interest which are mentioned as likely to be seen in that portion of the park around the building which is to be devoted to the French exhibitors, are:—Model farms of the various provinces, with their stables, cattle-sheds, dairies, steam and other agricultural machinery, and apparatus for making bricks, tiles, and drain-pipes; distilleries of spirits, essences, and resins; a charcoal manufactory complete, with a shop for the sale of its productions; a complete photographic establishment, and a dark chamber for photometric experiments; a manufactory of perfumes, and principally of extracts from certain flowers, such as the jasmine and tuberose, which will be cultivated, if possible, in the park itself; a horizontal flour-mill, and establishments for producing bread and pastry for the supply of the Exhibition; an electric lighthouse, two hundred feet high, for illuminating the park at night; and a coast light-

house of the first order; an establishment for the cupellation of lead, and the making of copper and leaden pipes; an iron and bronze foundry; a glass-house; and manufactories of white-lead, sodium, and other chemical products.

A special site is said to be reserved for an observatory, where astronomical and philosophical instruments will be exhibited in action, and another for a campanile tower, with clock and chimes. Several hothouses and conservatories, exhibiting various methods of construction and heating, and filled with exotic plants; kiosques, chalets, rustic houses, fountains, ornamental vases, and garden furniture of all kinds will be distributed about the grounds. Architecture and construction will be illustrated by specimens of the principal modes of building in stone, brick, pottery, imitation marble, cement, concrete, and wood. One exhibitor proposes to contribute trees and shrubs, ranging from one to six metres high, sufficient to form fifty-three clumps, to fill a total space of seven hundred square metres.

Such are a few of the promised attractions of the Universal Exhibition of 1867.

FRENCH INDUSTRIAL COLLEGE.

The *Union Centrale des Beaux Arts* of Paris, whom admirable exhibition is now open in the Palais de l'Industrie, has just determined upon the establishment of a great college for pupils in the industrial arts. The directors of the Union consider that in order to give sound education in art as applied to industry, something more is wanting than museums, libraries, and courses of lectures, however excellent and complete in themselves, and the first step has been taken to unite all the means of instruction in one great collegiate establishment.

A piece of ground, containing between fifteen and sixteen thousand square yards, has been secured in the immediate neighbourhood of the Faubourg Saint Antoine, the very centre of the manufacturing quarter of Paris. The new college to be raised on this spot is to afford accommodation for five hundred resident pupils, and the organisation will include all that is necessary for the study of industrial art in its various branches; it will be a great normal school for the training of designers and managers of artistic establishments. The society itself will occupy one wing of the building with its museums and library, and it is proposed that each division of the former shall be decorated in the style of that epoch of art of which its contents will form the illustration, and that, as far as possible, the books, drawings, engravings, and other matters relative to the period shall be placed in immediate proximity with that section of the museum to which they have special reference. The estimate sets apart a sum equal to £12,000 for the annual salaries of the professors, in order that the most able industrial artists may be induced to lend their aid in the training of the rising generation of art-workmen. An important feature in the plan is the establishment within the college of a certain number of *ateliers d'honneur*, which will be given, for life or otherwise, to eminent artists and art-workmen, whose example will best guide the hand, instruct the eye, and cultivate the taste of the pupils. It is proposed, amongst other things, to include a school of equitation in the establishment of the college, not only with the view of supplying the pupils with the means of a healthful exercise, but also of making the eye acquainted with the living model of the animal in its various movements; and to arrange the lecture theatre in such a manner that it may be used for dramatic representations, the pupils being at once the scene painters, costumiers, and actors, and thus becoming theoretically and practically acquainted with an important branch of industrial art.

It is not intended that the education of the college shall be gratuitous; on the contrary, the fees will be rather high; but it is proposed that the sons of work-

men shall be admitted to the courses of study, as out-door pupils, on payment of three francs a month.

Modifications will doubtless be made in the scheme as now sketched, but there is little doubt that the proposed college will be established, and the *Union Centrale* may well be proud of being the first body which has thought of applying the principle of thorough collegiate education to industrial art.

It is worthy of remark that the project is quite independent of the government; the first idea is said to have been thrown out by M. Daruv, the Minister of Public Instruction, who is indefatigable in improving the means of education of every kind, but the initiative is due to M. Guichard, the President of the *Union Centrale*, who not only drew out the scheme of the new college, but, in conjunction with M. Sajou, another member of the direction of the society, supplied the funds for securing the land on which the building is to be erected. M. Guichard is an architect and decorative artist, and M. Sajou a modeller of upholstery, so that the new college springs directly from the class to which it is to be devoted.

Manufactures.

BRADFORD CHAMBER OF COMMERCE.—RUSSIAN TARIFF.—A special meeting of the Chamber of Commerce was held recently, at Bradford, for the purpose of meeting Mr. Michele, *attaché* to the British Embassy at St. Petersburg, who attended with patterns of Russian goods, similar to woollen and worsted fabrics manufactured in his district, upon which he desired to elicit the opinions of the chamber. H. W. Ripley, Esq., the president of the chamber, occupied the chair, and the other gentlemen present, besides Mr. Michele, were Mr. Alderman Mitchell, Mr. J. A. Unna, Mr. C. Stead, Mr. Jacob Behrens, and Mr. H. C. Churton, Mr. Hirst, of Leeds, and Messrs. Hrierly and Jubbs, of Batley. The President briefly introduced Mr. Michele, and stated that he had accompanied Mr. Lloyd, President of the Associated Chambers, and Mr. Goodman in their visit to the Moscow Exhibition. Mr. Michele, in introducing his patterns of goods to the notice of the meeting, said his principal object was to obtain as minute a report as possible of these goods, in order that, in the report he should have to submit to Earl Russell, he might make a comparison of the relative cost of the production of the two countries—Russia and England—because there were many arguments in favour of the reduction of the high rate of duty in Russia which might be deduced from such an inquiry. They would probably find that up to a certain point Russia produced qualities of goods with which foreign countries could not compete. On the other hand, the higher qualities were produced far cheaper and much better here. This might be an argument in favour of reducing the duties on those qualities. Mr. Lloyd and Mr. Goodman had done good service in this direction—they had sown good seed, which, no doubt, in due time would germinate and bring forth fruit. Very probably within the next few years a considerable reduction in the Russian tariff would be made. There was great opposition on the part of the manufacturers. The Russian government were not absolutely opposed to the principles of free trade, but they did not defer to the opinion of the people they governed. Public opinion in that country had great weight at the present time, and the Russian government were afraid of committing themselves to any policy which might be condemned by large sections of the people. Therefore, this session would have to be agitated, and he had no doubt, with the aid of the press and by other means, it would ultimately be made manifest to the people of Russia that they had nothing to fear from competition, but that, on the contrary, their manufactures would be improved and new markets created. Mr. Michele cited some of the protectionist arguments which were at present used in

Russia, and said that by the diffusion of more enlightened economical views upon this question the result in a few years would no doubt be the gradual reduction of the Russian tariff. Her Majesty's government were quite ready at any favourable opportunity to exert their influence with the Russian government to bring about such a change in our commercial relations with Russia as would be conducive to the mutual advantage of the two countries. The gentlemen present formed themselves into a committee to examine the patterns of goods and report thereon.

Commerce.

THE INDIAN TEA TRADE.—This trade (says *Traveller's Circular*) is still in its infancy, and though its prospects are far more satisfactory than those of Japan, there are still many difficulties to be overcome before it can reach the development of which it is capable. Although India is an old dependency, it is but a young colony; in fact, it is still in transition from one state to the other. The aboriginal inhabitants and the European settlers are in an anomalous position, mutually jealous of each other, and for the most part without any common interest or sympathies; and it is no easy task for the Government officials, brought up among the traditions of the old regime to accommodate themselves to the new state of things, and to observe a strict neutrality between the disputants. There is great room for improvement, also, in the regulations framed for the sale of waste land, suitable for the cultivation of tea; the present system appears to lead to great abuses, and to retard rather than to advance the object for which it was framed. But India possesses what Japan does not—a stable and enlightened Government; old traditions are gradually dying out, as fresh legislators, with independent ideas, are brought in to fill up the gaps which so frequently occur even in the ranks of civilians serving in a tropical climate; education is spreading rapidly among the natives, and already a more intelligent class of colonists is being attracted by the prospect of obtaining, in a few years, at small risk of health, and with comparatively little labour, a competence which the work of half a life-time spent in Europe might fail to secure. The Indian tea plantations only require time to mature, and the skill of a sufficient number of intelligent Europeans, backed by a good supply of native workmen to perform the heavier manual labour, and the result is certain. The great experience in tea cultivation which the Chinese enjoy, aided by their industry and business ability—qualities for which the natives of India are not remarkable—will probably always make China the largest tea-producing country of the world; but their feeble government, and the unlimited exactions of their rulers, will be found to be serious drawbacks in a competition with a country living under British rule, and India, possessing this advantage, cannot long continue to be far behind in the race.

COTTON CULTIVATION IN INDIA.—It appears, by the *Cotton Supply Reporter*, that the report of the Cotton Commissioner of the Bombay Presidency upon the distribution of American seed, and the means taken to extend the cultivation of the New Orleans variety, recently published by the Bombay Government, tends to explode the opinion so long and tenaciously held by those entrusted with the management of Indian affairs, that cotton of a quality to rank with American cannot be grown in India. The repeated recommendations of the Cotton Supply Association to promote and encourage the growth of this description of cotton in that country have more than once been met with the reply that the experiment had been tried and had failed, and that, therefore, it was useless to repeat it. In these papers their own officer shows to the Government that not only has there been success in Dharwar, as Mr. Shaw, to whose zealous and persevering

exertions that success is mainly attributable, has long since demonstrated, but in other districts also where similar exertions have been made. In Mysore, the ryots of their own accord have taken up the cultivation of American seed. In the North-west Provinces and the Punjab, the Commissioner fully believes that the introduction of the New Orleans cotton from acclimatised Dharwar seed will be successful, and he is satisfied that the failure in Berar is only temporary, and is owing to the deterioration which the seed had undergone from having been shut up in the heated and close atmosphere of the ship's hold, and to lateness in sowing. "It is held to have been demonstrated in this Berar experiment that cotton of staple and colour which will always hold its place in the British market may be grown to a good profit by Indian ryots in Central India." The conclusion adopted is, that not only will the acclimatised American plant thrive in many districts of the Punjab and North-west Provinces and elsewhere in India, but there is good ground to expect that "the home market will be extensively supplied" from those sources with this description of cotton. Our hope of India, though long deferred, is thus, it seems, to be realised at last. This much may at least be expected, that the representations and counsels so often urged upon those at the head of Indian affairs will now, thus corroborated, obtain a degree of attention which hitherto they have failed to command.

Colonies.

SUGAR CULTIVATION IN QUEENSLAND.—It seems now clearly proved that this class of cultivation has taken firm root in this colony, many thousand acres having been taken up for sugar-growing purposes, under the new regulations which grant a lease of any unoccupied Government land selected, at a very low figure, to actual cultivators, with a purchasing clause during any renewal or expiry of the lease, leaving the capital of the sugar-grower intact to further his business, and at the same time securing him the land as if he were a freeholder. There are tens of thousands of acres still available for sugar-growing.

COTTON IN QUEENSLAND.—A considerable number of the cotton cultivators of this colony lately held a meeting to urge on the Government the necessity of continuing the cotton bonus regulations for a few years longer, and which there is every reason to expect will be done. The last season has fully proved the adaptability of the colony for growing cotton, the crop having proved a profitable one.

AN EXPEDITION has just started for the interior of the Australian continent. This time the object is not so much to obtain an acquaintance with the country—although that of course will be one of the results—as to solve the mystery of the life or death of Dr. Ludwig Leichardt, who, in 1843, started from the settled district of Queensland to endeavour to cross the continent to the Gulf of Carpentaria, and who has never yet been heard of. The mystery connected with his fate, commencing at this date, still remains to be cleared up after the elapse of 17 years. A subscription has been raised by the ladies' committee to the amount of £900. The Victorian and South Australian governments have contributed each £500; the Queensland government has given £1,000; the Sydney government intends to double private subscriptions. The party engaged to conduct the search consist of eleven persons, all accustomed to bush life, and mostly of middle age. None of them, however, except the leader and a surgeon, have been to previous explorations. They are accompanied by 14 camels and over 40 horses.

INTERCOLONIAL EXHIBITION AT MELBOURNE.—The Legislative Assembly having assumed the desirability of intercolonial exhibitions of industry and art, steps will be taken to hold the first intercolonial exhibition in Melbourne

during the ensuing year. A grant of £2,000 has been sanctioned by the colonial parliament; and, in order that ample time may be afforded to mechanics, artisans, and manufacturers to enter into competition, a royal commission will be appointed, and the conditions of the exhibition promulgated. The liberality of the Victorian government ought to receive such encouragement as will induce the colonies generally to participate in the advantages of the show, and remove those jealousies which, at the outset, are likely to operate against the scheme.

Obituary.

THOMAS WINKWORTH.—Another of the few remaining links between the past and present in the history of the Society of Arts has been severed. Death has recently removed from the Council table one of the oldest and most tried friends of the Society. In 1822, Thomas Winkworth was elected a member of the Society of Arts, and from that time he never ceased to take an active interest in its work. Born in 1790, the son of the Rev. William Winkworth, at the age of sixteen he was apprenticed to a silk manufacturer in Spitalfields, and thus became intimately connected with the commercial interests of his country. After serving the usual period of apprenticeship, and being made a freeman of the Fishmongers' Company, he established himself as a manufacturer and merchant in the City of London in 1812. He purchased the freedom of the Weavers' Company, and soon became known and active among those who, some forty years back, took steps to free the silk trade from the restrictions under which it was at that time carried on. He also gave great attention to all that was being done about the same period to improve the mechanical appliances of the weaver. Having joined the Society of Arts, he soon evinced a lively interest in its proceedings—an interest which was ever increasing and progressing. From his first entrance into life as a manufacturer he desired to be free from all the antiquated forms and practices which restricted industry, believing that, as in fashion, so in the modes of carrying on industries, the public demand a constant change, and so much in the materials employed as in the method and form of applying them. This conviction led him to give much time and attention to the Society of Arts, and to any and every effort to render that body more vigorous; his active co-operation was always to be relied on. He was one of those who helped to remove the restrictions which prevented the Society from rewarding invention when patented, a restriction which was in force up to 1844. In 1846 he advocated with other members the incorporation of the Society by Royal Charter. He very early recognised the importance of giving to Industrial Exhibitions an international character, and never ceased to take an active interest in them. He acted as Juror, and reported on the International Exhibitions of 1851, 1855, and 1862, as well as those of Dublin in 1854, and Florence in 1860. Since 1862 he allied himself to the movement which has spread so rapidly among the working classes and created so many displays of their industry; at the time of his death he was both a trustee and guarantor of the North-East London Exhibition—now open. He was a warm advocate of all those measures which tended to improve the educational, moral, and moral condition of the industrial classes. The members of the Society well know how constant an attendant and zealous a worker he was at the Society's meetings, and the *Journal* contains many evidences of his zeal and good wishes for the prosperity of the Society of Arts. He died on the 15th September, after a few hours' illness, at his residence in Canonbury, aged 75, and was interred at Highgate Cemetery, deeply regretted as an affectionate father, a sincere friend, and a useful and upright citizen.

JOSEPH F. B. CHARRIERE, one of the most celebrated surgical instrument makers in Europe, died recently. Science and humanity generally owe him a deep debt of gratitude for the immense improvements which he has made and induced in the art to which he devoted himself. M. Charrière was born at Fribourg, in Switzerland, in 1803, but he was apprenticed to a cutler in Paris; he was the founder of the establishment which he conducted to the day of his death. His instruments have earned him medals and recompenses at numberless exhibitions; he was made Chevalier of the Legion of Honour in 1844, and after the Great Exhibition of 1851 was raised to the grade of officer of the order.

Publications Issued.

LES OUVRIERS D'UN PRESENT ET LA NOUVELLE ECONOMIE DU TRAVAIL. By M. Audiganne. (Paris. 8vo.)—An attempt, by an able writer, to indicate the various phases of the life of the working classes, and to show what influences are at work which may produce changes in the economy of labour. The labourer himself, the tools and machinery employed, and the principles of association, are naturally three main heads of the discourse. The author belongs to the liberal school of the economy of labour, but he does not commit himself to the announcement of any special theory for the future.

CODE INTERNATIONAL DE LA PROPRIÉTÉ INDUSTRIELLE, ARTISTIQUE, ET LITTÉRAIRE. By J. Pataille and A. Huguet. (Paris. 8vo.)—A collection of the conventions and regulations of European governments respecting patents, literary productions, the theatre, music, the fine arts, trade marks, and piracy, with an explanatory introduction.

ANNALES DE LA PROPRIÉTÉ INDUSTRIELLE, ARTISTIQUE, ET LITTÉRAIRE. By J. Pataille and other writers. (Paris. 8vo.)—The eleventh number of an annual publication, containing a large amount of important facts and opinions relative to artistic, literary, and industrial questions.

Notes.

TAPETRIES AT HAMPTON COURT PALACE.—The removal of the miscellaneous portraits from one of the long galleries of this palace to the Cartoon Gallery has disclosed a fine series of decorative tapestries on the walls, which are of the latter part of the seventeenth century, and are well fitted to the room. It is to be hoped that Mr. Cowper will allow them to remain, being part of the original decorations of the building, and much more appropriate and decorous than a number of miscellaneous portraits hung without any classification.

CHEMICAL SCIENCE IN GERMANY.—Such is the appreciation of chemical science in Germany, that at the present time two large chemical laboratories, on the most complete scale, are in course of being erected in Berlin and Bonn, at the expense of the state. They will cost, it is said, about £75,000.

COMPOUND BRIDGE.—A new bridge, constructed over the Seine, between St. Cloud and Sèvres, has recently been opened for foot-passengers and vehicles. It is a compound bridge, for general traffic and also for the continuance of the Auteuil railway, which by its means will be carried almost to the gate of the Exhibition of 1867, and also placed in connection with the Chemin de Fer de Ceinture, which connects all the main lines of railway having termini in Paris. The bridge is a handsome, though simple structure, of five arches, about 360 or 370 feet long, and perfectly level, the banks being high at the spot where it crosses the Seine. The total width of the ridge is full 90 feet, and affords room for the railway viaduct, two carriage-roads, each twenty feet wide, and two broad footpaths. The viaduct occupies the centre of the bridge; it is about forty feet high above the carriage-

ways on each side of it, and the walls of the arches of which it is composed, as well as of the viaduct beyond the bridge on either side of the river, are pierced throughout by two smaller arches, which will afford a double covered way for foot passengers for the distance of about a mile. The whole is built of stone, carefully dressed and finished, and presents a very elegant appearance.

POSTAGE STAMPS.—A proposal has been made to the Minister of Finance, by French merchants, for the issue of postage-stamps of the value of five, ten, and twenty francs each, to be used not only for the prepayment of heavy packets sent by post, but also for the discharge of small accounts. The existence of some such means of payment between England and France would be a great boon, and now that a system of post-office orders exists between France and Italy, there is some natural impatience on the subject. For the payment of sums too small for cheques no ready means exists, although the rapid growth of relations between England and France so much demands such an arrangement. It has been asserted that the idea of a stamp for prepayment of postage originated in France in the reign of Louis XIV., but in the absence of any proof of the fact, little attention was paid to the assertion. The following notice, said to have been issued in the month of August, 1653, has appeared in a French newspaper:—"On fait savoir, y est-il dit, à tous ceux qui voudront écrire d'un quartier de Paris en un autre, que leurs lettres, billets ou mémoires seront fidèlement portés et diligemment rendus à leur adresse, et qu'ils en auront promptement réponse, pourvu que, lorsqu'ils écriront, ils mettent avec leurs lettres, un billet qui portera port payé, parce que l'on ne prendra point d'argent, lequel billet sera attaché à ladite lettre ou mis autour de la lettre ou passé dans la lettre, ou en telle autre manière qu'ils trouveront à propos, de telle sorte néanmoins que le commis le puisse voir et oster ayément. Chacun étant adverty que nulle lettre ni réponse ne sera portée, qu'il n'aye avec icelle, un billet de port payé, dont la date sera remplie du jour et du mois qu'il sera envoyé, à quoy il ne faudra manquer, si l'on veut que la lettre soit portée. Le commis général qui sera au palais, vendra de ces billets de port payé à ceux qui en voudront avoir, pour le prix d'un sol marqué, et non plus, à peine de concussion; et chacun est adverty d'en acheter pour sa nécessité, le nombre qu'il lui plaira, afin que lorsqu'on voudra écrire, l'on ne manque pas pour si peu de chose à faire ses affaires," with the following memorandum appended:—"Outre le billet de port payé, que l'on mettra sur cette lettre pour la faire partir, celui qui écrira aura soing, s'il veut avoir réponse, d'envoyer un autre billet de port payé, enfermé dans sa lettre." The stamp, or rather ticket, as may be seen, from the above quotations, applied only to Paris, cost one "sol," or halfpenny, had to be purchased beforehand at the palace, might be fixed on or placed in the letter in any way, provided the clerks could see it, but required to have the day of the month when it was used marked upon it. Moreover, its use was rendered obligatory by the announcement in question. It was doubted whether this order had ever been carried into practice, but a letter addressed by M. Pelisson to Mlle. de Scuderi, to which such a ticket had been attached, is said to be in the possession of M. Feuillet de Conches. At any rate it is clear that the system was soon abandoned, and that no method of payment by means of stamps or tickets was in use in France until the year 1849. In the following year the issue of stamps amounted to 21,523,175; in 1864 it was 382,655,450. The value of the annual augmentation since 1854 has varied between three and four millions of francs.

VINTAGE IN THE NEIGHBOURHOOD OF PARIS.—The vintage began in some parts of France as early as the middle of August, and nearly everywhere in the first week in the present month. It is not perhaps generally known that from seventy to eighty thousand casks of wine are produced annually in the district to the north of Paris, and of which Argenteuil is the centre. There

are about fifteen hundred vine growers in the locality in question. The vintage commenced on the 7th September, about nine thousand persons being engaged to aid in the gathering. The opening of the vintage is officially announced, and labourers, male and female, come from all parts to the little town of Argenteuil, where they camp in the streets for the night, roasting potatoes for their supper by bonfires, and singing and dancing till three in the morning, when the vine growers appear, engage as many hands as they require, and march off home, each at the head of their squad. The scene is one of the most extraordinary that can be witnessed when the narrow streets of Argenteuil are filled with ten thousand men, women, and youths, all determined to enjoy their annual *fête*. The great abundance of grapes, and the heat of the weather made the scene this year more noisy and more exciting than usual. It is calculated that the yield will reach nearly a hundred thousand pieces, or about six millions of gallons. In old times, when the crop was good, a cask was often filled for fifteen or twenty francs, say about three pence per gallon, but in 1855 the price had risen to considerably over a hundred francs. A hundred years ago the wine of Argenteuil was considered equal if not superior to Burgundy or Champagne; if that appreciation was a just one, the metropolitan grapes must have sadly deteriorated, or the products of the latter provinces greatly improved, unless indeed a great change has come over men's palates, for certainly at the present moment no one will drink the wine of Argenteuil if he can obtain any other.

ECONOMIC RAILWAYS.—In the *Journal* of the 7th of July last will be found an account of the measures adopted by the French Government for the extension of the railway system to the rural districts of the country, and of the economical arrangements connected with the plan. The realisation of the object in view depends, in some measure, on the adoption of light and efficient engines, and the government has recently purchased the free use of a locomotive designed by an engineer named Rarchaert, for the purpose of running on light rails, and passing over sharp curves and steep inclines. M. Rarchaert's engine, with tender and fuel, does not exceed twenty tons in weight, has four pairs of wheels, coupled, and will not require rails exceeding forty pounds in weight to the metre. The pressure of each wheel would thus be equal to two tons and a half, while that of the locomotives in use on the great lines ranges between five and six and a half tons, and the rails themselves weigh from seventy to eighty pounds per metre. The engine is said to be able to draw 640 tons, in addition to its own weight, on a level, 810 tons up an ascent of 5 in 1,000, and so on, to 74 tons on a gradient of 80 in 1,000; and, at a speed of from eighteen to twenty-four miles an hour, it will, according to the inventor, work safely on curves of a minimum radius of sixty metres; and, therefore, by adopting gradients varying from 12 to 30 in 1,000, nearly all necessity for tunnels, viaducts, and embankments would be avoided. The inventor calculates that under his system the average cost of these local railways will not exceed 60,000 francs the kilometre, or less than £4,000 per English mile.

Patents.

From Commissioners of Patents Journal, September 29th.

GRANTS OF PROVISIONAL PROTECTION.

Breech-loading fire-arms and cartridges—2346—F. W. Prince.
Cages and holsts, safety apparatus for—2383—J. C. Broadbent.
Cast-steel—2277—J. Grand.
Cotton wool, &c., combing—2164—G. Little.
Crucibles—1884—G. Nimmo.
Dry docks, floating—2387—E. Clark.
Effervescing drinks—2377—O. W. Jeyes.
Electro-magnetism as a break power on railways—2238—E. Cowpe and D. Hancock.
Fire-arms—2276—J. Snider.
Flying toys—2208—H. A. Bonneville.

Gases made in smelting iron, separating dust from—2391—E. A. Cowper and C. W. Siemens.

Gun barrels, tubes for—2351—G. P. Harding.
Harrows, &c.—2331—J. Badger and J. H. Steff.
Hides, &c., splitting, shaving, and paring—2252—H. H. Doty.
Hydraulic break—2337—W. J. Murphy.
Hydro-carbon or paraffin oils, treatment of—2006—J. W. Perkins.
Hydropulps and hydrstatic pumps—2306—J. Webster.
Iron—2347—W. Unwin.
Knitting cotton, winding—2311—H. Shanks.
Locomotive engines—8328—E. Aitken.
Metal articles, shaping—2371—J. H. Johnson.
Metals, casting—2401—D. Spink.
Mills for grinding—2264—W. Barford and T. Perkins.
Motive power, obtaining—1852—H. A. Dufresne.
Night lights—2367—F. Meyer and J. W. Freestone.
Perambulators, &c., canopies for—2389—H. Lloyd.
Pipes used for smoking—2226—O. A. McEvoy.
Projectiles—2281—A. V. Newton.
Pulleys—2333—G. Tangey and J. Jewsbury.
Railways, signalling on—2309—J. Anderson.
Railways, apparatus for stoning—2301—J. Askew.
Revolvers, breech-loading—2210—F. Polain.
Rivets—2355—J. Wakefield.
Saw-alls—2389—H. A. Bonneville.
Ships and other vessels, propellers for—1845—C. Hawk and A. Penn.
Shirts—2254—J. M. Carter.
Skates—2180—J. I. Barber.
Spinning frames—2343—A. V. Newton.
Steam boilers, preventing incrustation in—2373—J. Howard, W. Stafford, and W. F. McCallum.
Steam boilers, safety valve for—2323—H. Haskett, T. Wright, and E. Pearson.

Stone, cutting—2363—A. V. Newton.
Submarine telegraph cables—2341—J. O. O. Phillips.
Telegraph cables, submerging—2281—J. Spruel.
Telegraph cables, apparatus for laying—2253—K. J. Perceval.
Tobacco, cutting—2359—E. T. Read.
Type for printing, apparatus for "composing" or setting—2303—A. Mackie and J. P. Jones.

Vent pegs—2365—R. M. Lowrie.
Watches, &c., winding up—2274—R. A. Broome.
Wearing apparel—2317—R. C. Newberry.
Weaving, looms for—2295—J. Smith.
Wheat, &c., mills for grinding—2399—J. Tye.
Windows, opening and closing—2319—J. Pennington.
Wool, &c., combing—2299—A. Morel.
Yarn cops, winding—2267—W. Oldham.

INVENTIONS WITH COMPLETE SPECIFICATIONS FILED.

Electric bells, &c., ringing—2421—W. Moseley.
Machinery, lubricating—2429—H. A. Bonneville.
Peat or turf for fuel, preparing—2436—T. V. Lee.

CANTOR LECTURES.

ON SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS." By DR. F. GRACE CALVERT, F.R.S., F.C.S.

LECTURE II.

DELIVERED ON TUESDAY, THE 11TH OF APRIL, 1865.
On the Discoveries in Chemistry applied to Arts and Manufactures.—(Continued.)

One of the most curious and important applications which have lately been made of chemistry to manufactures is that of coal gas as a means of obtaining intense heats. In fact, heats have been secured which far exceed those previously obtained by the combustion of coals and their carbonaceous matters.

To understand how this result has been effected, it is necessary that I should say a few words on the combustion of coal gas. When coal gas is ignited, the oxygen of the atmosphere first combines with the hydrogen of the hydro-carbons, either gaseous or sufficiently volatile to assume a gaseous form, so as to produce water. Whilst a part of the carbon of these hydro-carbons combines with the oxygen to produce carbonic acid, the other portions of carbon float in the mass of ignited gaseous matters, and reach a sufficient temperature to radiate light in all directions. It follows, therefore, that the richer the coal gas is in hydro-carbons, into the composition of which enters a large proportion of carbon, the more brilliant will be the flame.

This is beautifully illustrated by an invention which I have the pleasure of showing you through the kindness of the Rev. Mr. Bowditch, of Huddersfield, who has lent me one of the apparatuses which he has lately invented to increase the illuminating power of inferior coal gas, and which has been applied with success in the city of London by its armed officer of health, Dr. Letheby. It consists in the introduction of carburetted hydrogens, rich in carbon, into the flame of ordinary coal gas, thus enhancing in a marked degree its illuminating power. This apparatus consists of—A gas-tight metallic vessel, which holds the hydro-carbons, and which has an inlet connected with a gas supply and an outlet connected with the burner. The gas in its course passes over the surface of the hydro-carbons. Being above the flame, the vessel and its contents become heated, and part of the latter is converted into vapour, which the passing gas carries with it to the burners to enrich the flame.

The following are the advantages which Mr. Bowditch's

apparatus presents:—Common coal gas, Ashburton flat flame, fish-tail, and batwing, does not yield a light of 1·5 standard sperm candles per foot, though it yields the light of 2·4 candles per foot when burnt in a 16-hole argand with a 7-in. chimney. By adding 31·5 grains of naphthalin vapour to each foot of this gas the light-giving value is raised to between seven and eight candles per foot, according to the constitution of the gas with which the vapour is burnt. Oils do not yield quite so high a result as naphthalin, but they afford from 4·5 to 5 times the light given by gas alone. To show the economy of gas, I may cite the following results, given to me by Mr. Bowditch:—A gallon of oil, sold retail for 2s., is capable of producing, with 1,000 ft. of London gas, more light than is given by 4,000 ft. of gas, or 4s. 6d. gas and 2s. oil against 18s. gas alone. The hydrocarbon vessel requires charging about once in 14 to 16 days.

But let us now return to the production of intense heat by the combustion of coal gas. This is effected by burning gas with an excess of air, generally speaking, under pressure, so as to bring into contact in a given space of time a large quantity of gases, especially an excess of oxygen, with a view of rendering perfect combustion of coal gas. The first instance, to my knowledge, of the perfect combustion of coal gas as a commercial application, was its use in machines for singeing cotton and woollen fabrics, or for the purpose of removing from their surface all loose and useless fibres. One of the most perfect machines which I have yet examined for accomplishing this purpose has been lately introduced to the notice of manufacturers by Joshua Schofield and Sons, of Manchester. The great merit of their machine consists in the fact that by it they can vary either the intensity of the flame or its length according, to the pressure at which the gases in combustion are made to issue from the machine. In fact, they can adapt with such nicety the action of the machine to the nature of the fabrics they have to singe, that it can be applied to the finest fabric, such as cambrics, and to some of the heaviest materials in cotton, such as fustian.

The most remarkable example of the intense heat which can be obtained by the combustion of gases was brought into notice a few years since by that distinguished chemist M. H. St. Clair-Deville (the discoverer of aluminium), by which he succeeded not only in melting several metals which, until his experiments, had resisted all other modes of effecting their fusion, but in melting in his laboratory as much as 25lbs. of platinum, one of the most refractory metals known, and running it into one solid ingot. In 1862, the well-known metallurgists, Messrs. Johnson and Matthey,

invited to their works a large circle of the most scientific men of Europe, who were attending the Exhibition as jurors, to witness the fusion of 220lbs. of platinum, and the running of it into one single solid ingot. This wonderful exploit in the production of heat was effected in a furnace similar in principle to that which had been devised by M. St. Clair-Deville, viz., in a furnace, the inner part of which was lined with blocks of quick lime, the only material found by M. Deville to be susceptible of resisting the intense heat which was produced by bringing at the upper part of the furnace a large jet of gas and air intimately mixed, and working under pressure. The flame, in passing from the upper part of the furnace and making its exit at the lower part, produced so great a heat as to melt the above stated quantity of platinum.

The observations of M. Deville soon brought into existence some extremely simple and handy furnaces to effect fusions and assays on a laboratory scale. Some of

the best furnaces contrived for that purpose are due to Mr. J. J. Griffin, of Bunhill-row. The principal feature of his furnace is using as a generator for heat a large Bunsen burner, which consists of a hollow tube, at the bottom of which there is an inlet for coal gas, and at a certain height in the tube a number of openings through which the air rushes in to mingle with the gas; both air and gas issue at the top of the tube, and when ignited produce an intense heat. The flame so produced is made to play round a crucible containing the materials to be assayed, and which itself is surrounded by thick earthenware tiles, preventing the heat passing through the furnace from radiating itself in all directions, thus concentrating its action entirely on the little crucible placed in the centre. But the most perfect contrivance of the sort which has yet been brought to the notice of the public is one due to Mr. G. Gore, F.R.S. The following is the description of Mr. Gore's gas furnace:

—A is a cylinder of fire-clay, about 9 inches high and 6 inches diameter, open at both ends, and with a hole at the back part near the bottom, to lead into the chimney; it is covered by a moveable plate of fire-clay, B, with a hole in its centre for the introduction of the crucible or of substances to be melted; this hole is closed by a perforated

plug of fire-clay, O, for access to the contents of the crucible; and that again is closed by another stopper of fire-clay, D. E is a chimney of sheet iron, about five or six feet high, kept upright by a ring of iron, F, attached to the top of the furnace. The fire-clay cylinder is enclosed in a sheet iron casing with a bottom of iron.

which are fixed three iron legs, G. An iron tube, H, with a prolongation, I, supports by means of the screw, J, the burner, K, and its tube, L, which is open at both ends. Gas is supplied to the burner by means of the tap, M, which has a small index, N, attached to it for assistance in adjusting the gas. Inside the largest cylinder is another fire-clay cylinder or cupola, O, with open ends, and with three projections of fire-clay, P, for supporting the crucible Q; it is kept steady by means of three clay wedges; R S is an air-valve for closing the bottom of the tube L. The gas burner is a thin metal cylinder, deeply corrugated at its upper end, with the corrugations diminishing to nothing at its lower end, as shown in the engravings. The action of this furnace is as follows:—Gas is admitted to the open tube L by the tap M; it there mixes with air to form a nearly combustible mixture, which ascends through the burner, and burns in the clay cylinder O, being supplied with the remainder of air necessary to combustion through the tube H to the outer surface of the flame by means of the spaces between the corrugations. The flame and products of combustion pass up through cylinder O, and then downwards outside of it to the chimney, the point of greatest heat being at Q.

Mr. Gore states that one of his smallest furnaces, consuming 33 feet of coal gas per hour is capable of melting 8 oz. of copper and 6oz. of cast iron; that the next sized furnace, consuming about twice the quantity of gas, will melt 40oz. of copper.

But the most important improvement which has been effected of late years in the production of intense heat by the combustion of the gases generated through the distillation of inferior coals, is that of Mr. C. W. Siemens, F.R.S., of Great George-street. The benefits which are conferred on manufacturers and the public by the furnaces devised by Mr. Siemens cannot be overrated. They are not only economical in their use, but as they enable the manufacturer to use an inferior class of fuel to generate the heat required, they must undeniably be of great ad-

vantage; and to the public in general they will be a great boon, as they do away with the nuisance attached to all manufacturing districts, in the dark black smoke escaping from chimneys, polluting the atmosphere and rendering it so disagreeable to those who are compelled by their occupations to live within reach of its influence.

I may state, *en passant*, that the large amount of black smoke which floats in the atmosphere of Manchester, Sheffield, Birmingham, and other towns, is not only injurious by depriving those places of much light so beneficial to life and health, but is also a nuisance from the immense amount of soot and dirt with which it is accompanied. There cannot be a doubt that, owing to the imperfect combustion which the products undergo in many of the furnaces belonging to manufacturers, and which is shown by the appearance of the smoke itself, the air is rendered more unwholesome than it would be if the products that escape had undergone perfect combustion, because volatile matters escape which are known to have a most destructive action on health and vegetation. The improved state of the public squares in London—and especially of those which are on the banks of the Thames—can be witnessed by all who have observed their condition since the consumption of smoke has been made compulsory in London and its suburbs.

Mr. Siemens's furnaces, I am happy to say, are not in a state of mere experiment, but they have received the sanction of a great number of manufacturers, and especially of those who little expected that the necessary heat for their operations could be obtained without interfering with their manufacture, in the carrying out of which they thought the production of smoke could not be prevented. Thus we find M. Siemens's furnaces employed with great success and economy in glass works, in potteries, and in iron forges, works which used to be a nuisance to their neighbours, by the large volumes of black smoke which they were constantly emitting from their chimneys.

Before describing Mr. Siemens's furnace, it is necessary

FIG. 1.

that I should state that, in the ordinary furnaces, only about 25 per cent. of the heating power of the fuel is rendered available in carrying out the manufacturing operations. This is due to imperfect combustion, and to the fact that only the heat of combustion exceeding that of the body treated is utilized; the remainder of the heat, in many instances, by far the greater proportion of the whole, being allowed to escape uselessly up the chimney.

I shall now give a description of one of M. Siemen's furnaces. The gas producer and furnace are quite distinct, and may be placed at any convenient distance from each other. The gas producer is shown in Fig. 1 (see page 713). The fuel is supplied at intervals of about two hours through the covered openings A, and descends gradually on the inclined plane B, which is set at an inclination to suit the kind of fuel used. The upper portion of the incline B is made solid, being formed of iron plates covered with firebrick, but the lower portion C is an open grate formed of horizontal flat steps. The opening under the lower step is made larger than the others, to enable clinkers to be withdrawn. The small stoppered holes FF at the front and GG at the top of the producer are provided to allow of putting in an iron bar occasionally to break up the mass of fuel and detach clinkers from the side walls. Each producer is capable of converting daily about two tons of fuel into a combustible gas, which passes off through the opening H into the main gas flue leading to the furnaces.

The action of the gas producer in working is as follows:—The fuel descending slowly on the incline plane B, becomes heated and parts with its volatile constituents, the hydro-carbon gases, water, ammonia, and a small proportion of carbonic acid, which are the same as would be evolved from it in a gas retort. There now remains from 60 to 70 per cent. of purely carbonaceous matter to be disposed of, which is accomplished by the current of air slowly entering through the grate C, producing regular combustion immediately upon the grate; but the carbonic acid (an incombustible gas) thus produced having to pass slowly through a layer of incandescent fuel from two to three feet thick, takes up another equivalent of carbon, and is thus transformed into carbonic oxide (an inflammable gas) which passes off with the other combustible gases to the furnaces. For every cubic foot of carbonic oxide thus produced, taking the atmosphere to consist of one-fifth part by volume of oxygen and four-fifths of nitrogen, two cubic feet of incombustible nitrogen pass also through the grate, tending greatly to diminish the richness or heating power of the gas. Not all the carbonaceous portion of the fuel is, however, volatilised on such disadvantageous terms; for water is brought to the foot of the grate by the pipe E, which, absorbing the spare heat from the fire, is converted into steam, and each cubic foot of steam in traversing the layer of from two to three feet of incandescent fuel is decomposed into a mixture consisting of one cubic foot of hydrogen, and nearly an equal volume of carbonic oxide, with a variable small proportion of carbonic acid. Thus one cubic foot of steam yields as much inflammable gas as five cubic feet of atmospheric air; but the one operation is dependent upon the other, inasmuch as the passage of air through the fire is attended with the generation of heat, whereas the production of the water gases, as well as the evolution of the hydro-carbons, is carried on at the expense of heat. The generation of steam from the water, being dependent on the amount of heat in the fire, regulates itself naturally to the requirements; and the total production of combustible gases varies with the admission of air, and since the admission of air into the grate depends in its turn upon the withdrawal of the gases evolved in the producer, the production of the combustible gases is entirely regulated by the demand for them.

The gas made in these producers has been frequently carefully analysed, and the average constituents of 100 parts have been found as follows:—

Carbonic acid.....	4.1
Oxygen	0.4
Carbonic oxide	23.7
Carburetted hydrogen	2.2
Hydrogen	8.0
Nitrogen.....	61.5

The furnaces are applicable for all purposes where intense heat is required, such as for glass houses, puddling, heating iron and steel, iron melting for foundry purposes, steel melting, muffles and copper smelting. In all applications the furnaces are of the same construction in principle, the arrangements only varying with the different operations to be carried on in the heating chamber. The heating furnace has been selected for illustration in Fig. 1, page 715.

Underneath the heating chamber K, are placed transversely the four regenerators L L L L, which are chambers filled with fire bricks built up with spaces between them. The regenerators work in pairs, the two under the right-hand end of the furnace communicating with that end of the heating chamber, while the other two communicate with the opposite end.

The gas passes from the main gas flue through the reversing valve S into the flues R R, at the bottom of one of the regenerators L, up through which it passes to the port M. Air is also admitted through a reversing valve at the back of S (not shown in the figure), thence into the flues O O, up through the second regenerator L, to the port N, where it meets with the gas, mingles with it, and produces an intense and uniform flame, which distributes itself all over the heating chamber K.

The products of combustion together with the excess or waste heat of the furnace, instead of being passed, as in ordinary furnaces, up the stack, and either entirely thrown away or only partially utilized, are carried down into the other pair of regenerators, where they are deprived of their heat, and thence proceed through the reversing valves to the chimney by the flue T.

When one pair of regenerators has become considerably heated by the passage of the hot products of combustion for some time, and the opposite pair correspondingly cooled by the upward passage of the cold gas and air, the valves are reversed, and the currents of gas and air then pass upwards through the regenerators last heated, whereas the products of combustion pass through those opposite. The process of reversing is repeated at fixed intervals, generally every half hour, so that two of the regenerators are always being cooled by the gas and air taking up the deposited heat and carrying it back to the furnace, and two always being heated by the passage of the hot products of combustion passing down to the chimney, and depositing their heat on their way there.

The flame in the heating chamber is uniform throughout, and perfectly free from all extraneous matter. Its chemical nature is also perfectly under command by means of gas and air regulating valves (not shown in the engravings), so that the most delicate operations can be carried on with great uniformity.

The gas and air reach the heating chamber (after passing through the regenerators) at nearly the heat of that chamber itself, and in burning, in addition to the temperature due to their mutual chemical action, is added that they have taken up in passing through the regenerators, so that an intensity of heat is obtained, which, unless moderated on purpose, would fuse furnace and all exposed to its action.

The products of combustion are so completely deprived of the heat they brought out of the heating chamber K, by passing among the regenerator bricks, that the heat in the chimney-flue is seldom sufficient to singe wood; the economy is therefore due to the fact that little or no heat is thrown away up the chimney, as in the ordinary furnaces, and also to the perfect combustion of the fuel which is evidenced by the total absence of smoke from

the stack; whereas in the common furnaces the combustion is so imperfect, that clouds of powdered carbon, in the form of smoke, envelope all manufacturing towns, and gases are allowed to escape with two-thirds of their heating power undeveloped.

The saving of fuel in these furnaces, as compared to the ordinary kind, ranges between 40 and 60 per cent. in weight, according to the fuel used. In many instances an additional saving can be made in the cost of the fuel by using inferior qualities, such as coal and cokes dust, lignite, and peat.

The intensity of the heat, purity of the flame, and the

absence of cutting draughts in the heating chamber, is of great advantage for all metallurgical operations, tending greatly to improve the quality of the produce, and occasioning a saving of about 5 per cent. in the waste of the metal treated in puddling and iron re-heating furnaces, &c.

The peculiarities and advantages of these furnaces are, that gas fuel alone is employed, that perfect and entire combustion is obtained, and that the heat, which is usually allowed to escape up the chimney, is here stored up to be afterwards brought back to the furnaces.

Whilst on the question of the combustion of coals,

FIG. 2.

and of smoke, allow me to draw your attention to a clever invention by Mr. Snook, of Manchester, which he calls an "Invigorator." The invention may briefly be described as an apparatus placed within the semi-circle forming the upper portion of an ordinary register fire-grate, formed entirely of cast-iron, and so constructed as to be readily applied to all existing grates known as of the register form. In experiments which have been made, it has been proved that after lighting the fire (the whole of the apparatus being closed so as to act as a blower), a brisk bright fire is produced in about four minutes. A large concave elliptical plate immediately over the grate bars, suspended on end pivots, is tilted over to an angle of about 70 degrees, when it is seen that the back or concave portion of the plate, acts as a bright reflector, throwing out the heat rays into the room, instead of allowing them to pass up the chimney. Two horizontal plate doors, or louveres, above the reflector, are next opened, when the draught is found to be reduced to the smallest amount compatible with the continuance of combustion in the grate. The heat thrown out from the fire is considerable, and the fire itself forms a pleasant object to look at, having a warm red glow, without either flame or smoke proceeding from it.

The next invention I wish to call your attention to is one, which, like that of Mr. Siemen's, is calculated to render marked service to society. It is the production of motive power through the combustion of coal gas, and you will I hope appreciate the discovery due to Mr. Lenoir, if you will call back to memory the efforts which have been made for the last 20 or 30 years, to generate power by employing the expansion which air or other gases undergo under the influence of heat as a substitute for steam—the long promised success and the unfortunate failures of Ericsson. What especially recommends the engines of M. Lenoir is their safety, for there is no danger of explosion; their cleanliness, for they require no fuel; their simplicity, which enables those who employ them to use them in any room at any height and at any spot where motive power may be required, for they have only to erect a little engine of one or two horse power, and whenever they require to use it, all they have to do is simply to bring into contact two poles of a battery, when the fluid so generated will traverse space, and convey motive power to the gas engine. Lastly, these engines are extremely economical in their working, for they consume only 70 feet of gas per horse power per hour; and assuming that 1,000 feet of gas is worth 4s. 6d., the cost of working an engine of one-horse power will be about 4d. per hour. M. Lenoir's engine is very similar to the ordinary steam-engine, having a cylinder, piston, crank-shaft, and fly-wheel. The following proportions of gas are admitted in the cylinder:—One volume of coal gas mixed with twelve volumes of atmospheric air. This mixture is ignited by the electrical spark from a battery connected by wires at each end of the cylinder. The connection being made and broken by the rotatory action of the crank-shank, the expansive force necessary to move the piston of the engine is produced by the ignition of the gas, which not only produces steam and carbonic acid by their combustion, but by the heat generated increases their volume to a sufficient extent to force the piston to travel backwards and forwards, thus producing motion. The engine once fixed, the battery charged, and the gas turned on, it is ready for action, and as soon as the work required is completed, the gas is shut off, the engine stops, and the expense ceases.

The facility for employing Lenoir's engine in countries where coal is not easily attainable has been increased by substituting for coal gas a mixture of oxide of carbon and hydrogen, which can easily be procured on a commercial scale at a small cost by passing steam over heated charcoal, the water being decomposed, its hydrogen being liberated, and its oxygen combining with the carbon itself produces oxide of carbon, and the mixture of these gases is a cheap and good substitute for coal gas. Con-

sequently M. Lenoir's engines can be employed with great advantage in our British colonies and in South America.

I shall now have the pleasure of calling your attention to an interesting and valuable invention of one of the most learned and eminent chemists of England, Dr. J. Stenhouse, F.R.S., who has devised quite a new method of waterproofing vegetable and animal tissues and fabrics. Previously to his discovery, the modes of waterproofing consisted in using bees' wax and various kinds of drying oils, such as linseed, the siccation of which is enhanced by boiling them with peroxides of lead or manganese. Further, you are all aware of the extensive use which has been made of caoutchouc and gutta percha for waterproofing purposes. Dr. Stenhouse's waterproofing material is a white solid substance, having no odour, undergoing no change through the action of the atmosphere, and which has acquired of late great popularity, by the application which has been made of it as an illuminating and lubricating agent,—I mean paraffin, the discovery of which, in a commercial point of view, and its introduction into public notice, are due to Mr. James Young, of Bathgate, near Glasgow, who has now established one of the largest manufactories in the world for the production of this article, notwithstanding it was considered a commercial novelty in 1852. Dr. Stenhouse found that if he employed pure paraffin for waterproofing, owing to its tendency to crystallise it would not adhere sufficiently to fabrics. He, therefore, conceived the happy idea of adding to it a few per cent. of linseed oil, which overcame the defects presented when paraffin was employed alone, effecting a better adhesion between the waterproofing material and the textile fabrics, and rendering leather more flexible. Dr. Stenhouse melts together paraffin with a few per cent. of linseed as above stated. He runs the whole into cakes, and in order to apply this waterproofing agent he beats the cake and rubs the materials over with it or spreads the melted mixture over the fabric by means of a brush. His process is applied with great advantage by Messrs. Silver and Co., to the waterproofing of soldiers' tents, and other materials of that class, to the great comfort of the soldiers, for, without increasing the weight of their tents, it renders them impermeable, and protects the men from rain and its attendant discomfort and danger. Another most useful application of Dr. Stenhouse's waterproofing material is the rendering of leather impermeable; by examining the specimen you will immediately see the immense advantage that cavalry will derive from having their saddles rubbed over with this preparation, as it renders the leather incapable of absorbing moisture, and enables the soldier to mount his horse after heavy rain with as much comfort as if it had remained under shelter. It also renders the soles of shoes quite impermeable, and at the same time communicates to them great flexibility so that the boots of navvies and other similar articles are rendered far more useful and durable, as we all know that the constant wetting and drying of leather expedites in a marked manner its decay. There is one more application of Dr. Stenhouse's waterproofing to which I do not wish to call your special attention, as it is of interest to the manufacturers of Manchester and of Lancashire generally. In those districts large quantities of what is called waterproofing materials are used in packing the goods, and preserving them from external wet or injury. Many of these materials are made by covering a coarse calico fabric with a coating of boiled linseed oil, but this class of packing is very imperfect, and loses its strength rapidly, especially in hot climates, owing to the fact that the boiled oil absorbs oxygen and carries it on to the fibre, oxidising it, and thereby soon destroying its tenacity. By applying Dr. Stenhouse's process to the fabric previously to the drying oil, not only is great impermeability attained, but the fibre, being saturated with paraffin, is preserved from the subsequent oxidation which it would undergo under the influence of the atmosphere in the presence of the boiled oil alone.

I should have wished to have dwelt at some length on the interesting application which has been made of late years, especially on the Continent, of another coal product, which, like most of those whose origin is due to coal, has received many valuable and beautiful applications. The one I now refer to is called bisulphide of carbon, and is applied with great success not only to the extraction of fatty matters from various seeds and fruits, such as olive, linseed, &c., but in Algiers for extracting from flowers various essential oils, commonly called perfumes, such as essence of roses, lavender, jasmine, &c. You will, no doubt, remember also the useful application which bisulphide of carbon receives in the hands of Messrs. Allbright and Co., of Birmingham, in separating the common phosphorus from the red or amorphous phosphorus now applied to the manufacture of chemical matches, as explained to you in my first lecture of last year's course.

I cannot conclude what I have to say respecting coal products, without stating the fact that, since I had the honour of delivering a lecture in this room, in 1862, many beautiful and valuable discoveries have been made in connection with coal-tar colours. Dr. A. W. Hoffman has succeeded in obtaining some magnificent purples, by a process as curious as it is highly scientific, and such as might be expected from so talented a chemist. Since then a splendid green colour, called verdine, and which has the curious property of retaining that colour in artificial light, *yes* more than that—of increasing in beauty in the presence of that light—has been discovered by M. Eusebe. A beautiful fast black, easily applicable to the art of calico-printing, has also been devised; and lastly, in the hands of Messrs. Simpson, Maule, and Nicholson, the well-known colour called magenta, and a beautiful blue called opal, have not only been much increased in beauty, but their cost of production has been materially reduced. In fact, at the present day, every shade of colour is produced from coal tar products; but the subject is too vast for me to attempt now to enter into details as to their mode of production and application.

As the hour is advancing, I must, though with regret, leave the interesting subjects which have reference to coal and its products, and pass to another class of manufacture. The first of these has reference to the refining of sugar, and among the several improvements which have been effected in this branch of manufacture during the last few years none is more important in its general bearing than that recently brought to the notice of the public by Mr. Alfred Fryer, of the well-known firm of Fryer, Benson, and Foster, of Manchester. This gentleman has published some valuable information on the composition of the sugar-cane juice, and the alterations it undergoes under the influence of heat and atmospheric air, and has conferred on the colonies a great boon by inventing an apparatus which will effect a great saving in obtaining sugars. Mr. Fryer's experiments on the cane juice teach us that, instead of only extracting 49 per cent. of the juice, as is usually the case, when the canes are worked by the old system, 61 per cent. can be obtained with a good steam engine having 24 inch rollers; and by pressing the megass a second time through the rollers as much as 70 per cent. can be obtained; and Mr. Fryer does not doubt that even 80 per cent. may be reached, if more attention is paid to the pressing of the canes through the rollers. Mr. Fryer has also published some interesting facts on the action of the oxygen of the atmosphere on cane juice. Thus he has observed that the juice rapidly darkens, and that this increase of colouration is not only an indication that the juice is undergoing deterioration, but that no amount of defecation will subsequently remove this colouration. He has further noticed that cane-juice rapidly becomes acid, and the acidity increases also in a very rapid manner. He gives an instance—a pattern of too many others—where the juice, after expression flowed down a spout 250 feet in length, from the mill to the boiling-house, occupying in its descent about half-a-minute. The amount of acidity

increased from 100 to 253, and the colour deepened fourfold.

Mr. Fryer has also published some very interesting facts on the influence of heat on the cane sugar, and I here take the liberty of extracting from a paper of his the following facts:—

"We now come to the boiling. All heat above 140° is capable of exerting an injurious effect. As regards the time this effect is proportionate to the duration of the heat; the continuance of any syrup for two hours at any given temperature would cause just double the mischief which would be produced by its continuance at the same temperature for an hour. But as regards the heat, the mischief increases about as the square of the difference from 140° the highest innocuous temperature. So at 160° during any given time a certain degree of mischief would be done. To keep the same syrup for the same time at the heat of 180°, would give four times the mischief; at 200°, nine times; the difference of 180° from 140° being twice as great as that of 160°, and that of 200° being three times as great."

This mischief consists partly in the change of colour, partly in the change of a quantity of cane sugar or sucrose into fructose. Both these kinds of sugar are present in all neutral saccharine solutions. Sucrose is the ordinary crystallised cane sugar; fructose exists more especially in some kinds of fruit, such as grapes, gooseberries, cherries, oranges, &c., which refuse to form well-defined crystals. Further, I should remark that, under the influence of heat, as just stated, cane sugar or sucrose, is converted into grape sugar or fructose, and that the presence of fructose interferes in a most extraordinary manner by preventing the free crystallisation of sucrose. Thus, for example, every particle of fructose in a mixed solution detains from crystallisation its own weight of pure sugar. In fact, it would be impossible, after mixing equal weights of loaf sugar and fructose in a solution to recover the former in a crystalline state. The change produced by the atmosphere alone, without the action of heat, shows the necessity of proceeding instantly to raise the temperature to the boiling point, and the concentration should be continued without loss of time. The temperature should not, however, be raised beyond the lowest effectual heat.

I will now call your attention to Mr. Fryer's "concretor," as he terms the apparatus, which is delineated on page 718. It consists of A A, inclined corrugated plates, over which the juice flows; a¹ a¹, connecting gutters for joining plates; B, furnace; C C, flue under plates; D D, tube-box heated by waste heat of furnace; d¹ d¹, supply cistern for revolving cylinder; E E, revolving cylinder, through which the juice is passed after leaving the plates A A; e¹ e¹, curved blades revolving with cylinder, and exposing the liquor to the hot air; e² e², friction rollers for supporting cylinder; F F, fan for drawing a current of air through tube-box D D and cylinder A A; H H, engine for driving fan and cylinder; h¹ h¹, shaft for giving motion to cylinder E by means of pinion A²; I I, covers for retaining around cylinder E the steam given off from plates A A.

From the further end of the cylinder a pasty mass is discharged, and, in cooling, it hardens into a non-crystalline homogeneous substance likely to be long known as Fryer's "concrete." Its material is simply cane juice deprived of its vegetable albumen and water, and, not being contaminated by molasses or caramel, is admirably fitted for the operations of the refiner, and will, therefore, command his attention. Allow me, further, to add that his process is easy to conduct; the apparatus, as you see, is simple and self-acting, not liable to derangement; that it performs a large amount of work; and therefore proves a material saving to the sugar producer. I cannot conclude my remarks on Mr. Fryer's invention, as applicable to the colonies, better than by repeating here the words expressed by the Governor of Antigua, who said, "I believe firmly that you have opened a new era of prosperity to

This illustration is one of the first applications of a new process for producing surface blocks from a drawing. It has been printed by this Society as an experiment. The drawing was placed in the hands of the artist on Wednesday morning, and the metal blocks ready for the printer were delivered the following day. It is right to state that, the drawing being of a geometric character in outline, the *quantity* of production is greatly increased. It should be added, that the drawing having been placed in the hands of a wood engraver of course on Tuesday morning last, it was returned by him as impossible to execute wood blocks in time for this week's *Journal*. The process of bearing on Art production will form the subject of a Paper to be read at an early meeting of the Society.—E. S. of A. J.

our colonies, and heartily wish you abundant success in the course on which you have entered." As to the advantages which a sugar refiner in this country will derive from employing Mr. Fryer's "concrete," instead of having to refine the molasses and coarse sugars usually imported into this country, they are so obvious that it would be really a loss of time to enlarge upon them. The saving to the refiner in having nearly pure sugar to operate upon, and not having to contend with the removal of colour, converted sugar, caramel, and other impurities, will at once convince you of the support and approbation the article will receive from the sugar refiner.

If, at the commencement of this lecture, I drew your attention to the value of intense heat produced at a small cost so as to enable our manufacturers to carry on their various processes, it now becomes my duty to inform you that of late years the cheap production and application of low temperatures has become a necessity, especially since organic products have been manufactured on an extensive scale. Three different machines for obtaining these low temperatures have been brought to public notice, viz.: First. That of Mr. Kirk, who has applied in a beautiful manner some of the physical laws discovered by Dr. J. P. Joule and Professor W. Thomson, in their researches on the mechanical theory of heat. Thus, Mr. Kirk succeeds in producing a low temperature by condensing under high pressure atmospheric air, which, on being allowed to resume its primitive volume, produces cold, for the compressed air cannot resume its primitive volume without the essential element for its expansion, namely, heat; and if the apparatus is properly contrived, which is the case in that of Mr. Kirk's, the heat necessary for the expansion of the compressed air is supplied to it by the body whose temperature is to be lowered. Although the construction of this machine is exceedingly costly, still it has been employed at Mr. James Young's works at Bathgate with great success to the cooling of paraffin oil to extract from it the solid paraffin which it contains. The second apparatus is that of Messrs. Harrison and Co., of London, who employ ether as the medium for producing low temperatures. The third is that of M. Carré—in my opinion the cheapest and most practicable apparatus yet invented for the purpose, the more so that it is applicable for household as well as for manufacturing purposes. Although I, like many of you, have witnessed the production of ice by it at the late exhibition, still I was not prepared to learn that it could be applied with economy to the extraction of some of the salts existing in sea-water. Still such is the fact. M. Ballard, a well-known French chemist, after many years' study and labour, succeeded in extracting from sea-water two products, which play a most important part in most of our large chemical works, viz., sulphate of soda and chloride of potassium. To produce the first, under ordinary circumstances, extensive works are required, such as are found at St. Helen's, and Newcastle-upon-Tyne, where thousands of tons of common salt are acted on by vitriol, which gives rise to muriatic acid and sulphate of soda. As to the salts of potash, the French, as well as ourselves, are dependent for it upon the forests of Russia and the native forest of Canada. By M. Ballard's discovery, France will free itself from a dependence upon foreign supplies for the potashes she may require, as well as the sulphur, and will also do away with the public nuisance, namely, the conversion of common salt into sulphate of soda. Without entering here into details, let me state that M. Ballard operates as follows:—In the early part of the spring season, considerable quantities of sea water from the Mediterranean are run into large shallow reservoirs. In the summer season the water evaporates, a certain proportion of common salt separates, and the concentrated water is stored in other reservoirs until winter, when it is again allowed to flow back into the shallow reservoirs, where it yields, during a cold night, thousands of tons of sulphate of soda. The mother liquors from which the sulphate of soda has separated are allowed to flow into Carré's

apparatus, where they are subjected to a comparatively intense cold, and yield large quantities of a double chloride of magnesium and potassium, which, on being subjected to heat in a furnace, gives hydro-chloric acid, magnesia, and chloride of potassium. This application of Carré's apparatus, in this instance, shows the simplicity and practicability of it. It is based on rather a different principle to those of Kirk and Harrison. To obtain a low temperature he applies heat to a vessel which contains a saturated solution of ammoniacal gas. This drives off the gas, which is made to pass into a vessel surrounded with cold water, where it liquifies itself by its own pressure. If then the heat be removed from under the solution, its temperature will gradually fall, and it will become again susceptible of re-absorbing the ammoniacal gas, thus facilitating its evaporation from the vessel in which it has condensed, and as it is necessary for the passage of the liquified ammoniacal gas into its gaseous form that it should absorb the heat from the surrounding medium, let it be water or any other fluids, their temperature will gradually decrease. The following diagrams will enable you to understand better the working of this invention:—

1. Before each operation incline the apparatus horizontally, and maintain it about ten minutes in the position represented in Fig. 1. 2. Place the boiler (A) in the furnace, and the refrigerator (B) in a bucket filled with cold water, so that the summit of the refrigerator be

covered with two or three inches of water. A small quantity of oil is poured into the tube which is placed in the upper part of the boiler, in which also a thermometer is placed. The apparatus is heated moderately until it reaches 266° . The apparatus is then removed from the fire, and the boiler is placed in the bucket of cold water. The hole of the refrigerator being stopped with a cork, and the tin vessel surrounded with alcohol, having previously nearly filled it with water, the congelation takes place by the evaporation of the liquid ammonia in the condenser.

Although the evening is far spent, I cannot leave you without calling your attention to a very ingenious mode, devised by M. Pelon, for warming railway carriages during cold weather. You are too well acquainted with the present clumsy and expensive method now in use to require any description from me. The only remark I shall make upon it is that it is the boon of those who are in least need of it, namely, first-class passengers, whilst those of the second and third classes have not that luxury supplied to them. To avoid loss of time, I shall not attempt to describe the various methods which have been proposed as substitutes for the one at present in use, but shall at once state that M. Pelon's method is based on the conversion of force into heat, the heat in this case being generated by friction; and from what I stated in my first lecture you must be perfectly *au courant* of what is understood in the present day of the conversion of heat into force, and *vice versa*. All those persons who were fortunate enough to visit the French Exhibition in 1855 must have been struck with a machine, invented by Messrs. Mayer and Beaumont, which generated enough heat to convert water into steam and thus obtain a motive power; and this was effected without fuel or electricity, but by mere frictional heat, which they obtained by causing a wooden mandril surrounded with tow to revolve with great rapidity inside a copper cylinder which itself was surrounded with a small quantity of water. The great merit of the invention of these gentlemen, and which drew upon them the special attention of the Emperor, was that neither the towed mandril, nor the copper cylinder were materially injured or deteriorated after many days' working. This important end was attained by them by allowing a gentle flow of oil to run constantly through the cylinder, thus preventing immediate contact between the towed mandril and the copper cylinder. In fact, the frictional heat was produced through the friction which took place between the particles of oil themselves, preventing thereby all wear and tear. Notwithstanding the ingenuity displayed in this invention, still as a means of obtaining motive power it was useless, for more force was required to generate an amount of heat than could be yielded by the friction of the particles of oil. But in the application which M. Pelon has made of this invention to the heating of railway carriages, the motive power required to generate the heat being produced without cost to railway companies, as it is caused by the very act of the travelling of the carriages themselves, the cause which accounted for the failure of the principle as a practical mechanical application, namely, the production of the force required to work it, is overcome. M. Pelon proposes to fix one of Messrs. Mayer and Beaumont's mandrils under each railway carriage compartment, and to convey the heat produced by the revolution of the towed mandril to the compartment itself by means of metallic conducting

surfaces, which in their turn will heat the atmosphere of the compartment. We shall, I am happy to say, within a year or two, know if M. Pelon's invention will be capable of general adaptation, as it is now being practically tested on one or two of the French railways.

Proceedings of Institutions.

KENT ASSOCIATION OF INSTITUTES.—The first annual meeting of the council was held at Ashford, on the 12th of July last, when H. Whitfield, Esq., of Ashford presided. It appears from the report that, immediately after the formation of the society, in July, 1864, the committee forwarded to every known Institute in the county, a prospectus, setting forth the objects and aims of the Association. They also issued a series of queries, with a view to the preparation of a table descriptive of the nature, position, and operations of Kentish Institutes. In replies placed the committee in possession of the following useful information:—That the Institutes in Kent number about seventy; of these twenty-five are termed Literary, Literary and Scientific; ten, Mechanics' Institutes; seven, Mutual Improvement Societies; two, Soldiers' Institutes; six, Working Men's Clubs; ten, Young Men's Societies; six, Reading Societies; and four bear the less definite name of Institute. Most of these societies possess libraries which contain in the aggregate about thirty-two thousand volumes, and are circulated amongst nine thousand members. Lectures are annually delivered at about fifty of the Institutes. Penny readings appear to have been successful at upwards of twenty. In-door amusements, such as chess and draughts, are provided by twenty; and out-door sports, as cricket, by seven. About thirty-five of the Institutes possess reading-rooms. In twelve classes have been formed for instruction in one or more of the following subjects:—Reading, arithmetic, writing, French, drawing, Latin, and music. Only six appear to have given attention to the schemes of examinations connected with the Society of Arts and other Educational Societies. The apparent wants of many of the Institutes may be classified thus:—1. Means of obtaining, at small cost, the services of suitable lecturers. 2. An acquaintance, on the part of the members, with the advantage derivable from the Society of Arts and other examinations. 3. Teachers qualified to conduct evening classes. 4. The formation or extension of libraries. 5. The possession of commodious premises. 6. That measure of public support which should be received specially on those classes for whose benefit the Institutes exist. I said in supplying these wants (says the report) is the duty of this Association, and the committee have to point out how far they have been able to promote so important an object. A list of gentlemen willing to give lectures or readings to Institutes (on payment of travelling expenses) has been prepared and published. It contains at present only twelve names, but it will, as a probability, be considerably extended before the next winter season. The Society of Arts Elementary Examinations, also the Oxford Local Examinations, have been brought prominently before the notice of the inhabitants of Kent; and the Committee rejoice that their efforts in this direction have been crowned with so much measure of success. Through the liberality of gentlemen taking a great interest in the work of adult education, the committee are in a position to offer prizes, in books, to successful candidates at the examinations. Arrangements have been made for the establishment of a circulating library. For an annual subscription of two guineas schools and Institutes will be entitled to fifty volumes at one time, which may be exchanged at the expiration of three months. Numerous applications have been made to the secretary for information as to the most successful description of building for Institute purposes, and also as to the usual modes of raising funds for the institution.

public buildings; and it is gratifying to know that some of the Associated Institutes are now in possession of very commodious premises, whilst others are making efforts to obtain adequate accommodation. The following schools and Institutes have been admitted into Union:—Ashford Mechanics' Institute, Chatham Mechanics' Institute, Chilham Mutual Improvement Society, Faversham Institute, Hamstreet Mutual Improvement Society, Rhode-street Schools (Chatham), Lenham Mutual Improvement Society, Sheerness Literary Institute, Ramsgate Working Men's Club, Whitstable Institute, Sittingbourne Institute, Staplehurst Mutual Improvement Society, Tunbridge Mechanics' Institute, Deptford Grammar and Collegiate School, Deal and Walmer Institute, Belgrave Mechanics' Institute (Tunbridge Wells), Ashford Mutual Improvement Society, and Lenham Grammar School. Returns made by eleven of the Institutes give as the total number of their members, 2,757; and of volumes in the libraries, 11,852. The Treasurer's statement gives the total receipts as £77 5s. 6d., and the expenditure as £50 18s. 6d., leaving a balance in favour of the Association of £26 7s.

CONSERVATOIRE IMPERIAL DE MUSIQUE ET DE DECLAMATION OF PARIS.

The following memoranda, having reference to the present state of the Conservatoire at Paris, and to the recent examinations held there, have been furnished by an occasional correspondent of the *Journal* :—

OFFICERS OF THE CONSERVATOIRE.

Director—M. Auber, Member of the Institute of France; Secretary—M. Alfred de Beauchesne; Librarian—M. Hector Berlioz, M. of the Institute; Administrator—M. Lassabathie; Director of School—M. Duvernoy.

In the list of professors are—M. O. Carafa, member of Institute; M. A. Thomas, ditto; M. Reber, ditto; M. Clapiason, ditto; M. Benoist, M. Henri Herz, M. Sax, M. A. Elwart, M. F. Bazin, M. Révial, M. Bataille, M. Giuliani, M. Maeset, M. Fontana, M. Tariot, M. Duvernoy, M. Batista, M. Padeloup, M. Levasseur, M. Morin, M. Mocker, M. Samson, M. Beauvallet, M. Regnier, Mlle. Augustine Brohan, M. Georges Mathias, M. Prunier, M. Alard, M. Massard, M. Franchomme, M. Labro, M. Dorus, M. Cokken, M. Gally, M. Meifred, and M. Arban.

PUPILS.

The number of pupils is on the average six hundred, and there is no charge whatever for the general instruction of the Conservatoire in any of its classes. All are out-of-door pupils with the exception of twelve young men in the vocal school who are lodged, clothed (in uniform), and supported within the establishment. There is a box at each of the operas reserved for these young men. There were formerly as many female pupils lodged in the Conservatoire, but this was found so troublesome that pensions have been substituted in the place of residence. By way of compensation, a certain number of female pupils receive a pension of 800 francs a year for two years. All the in-door pupils and pensionaires are bound to appear, if required, at one or other of the operas or theatres receiving a subvention from the government; and no pupil in the schools is permitted to appear in public without the special authority of the direction.

FORM OF APPLICATION.

Each applicant for admission must apply personally, and produce certificates of birth and vaccination, must be French, and not less than nine nor more than twenty-two years of age. The applicants are examined by a professor, and if, according to his judgment, they are sufficiently advanced to complete their education in two years, or exhibit peculiar aptitude, they are admitted provisionally, and are again examined at the general meetings for that purpose, which occur in May and December. There is also an extra examination for the admission to the singing class in March. No set form of application.

FOREIGNERS.

Foreigners may be admitted by authorization of the minister of state.

PROVINCIAL SCHOOLS.

There are five provincial schools—at Lille, Toulouse, Marseilles, Metz, and Nantes, which have the title of *succursales* of the Conservatoire, the last having been thus nominated in 1846. Some years since pupils were examined in these schools and sent up to the Paris Conservatoire, but this has been discontinued for some time, and candidates from the provinces have now to present themselves personally to the directors of the Conservatoire for admission. For all purposes connected with the pupils these local schools seem now to be completely dissevered from the Conservatoire—why, does not appear. That of Toulouse, however, exerts a very powerful influence, and supplies a large proportion of

successful pupils. Not only is there no preliminary examination in the provinces, but there is no recommendation of pupils by any of the authorities or musical professors in the provinces.

CLASSES.

The education is divided into the following eight sections:—1. Solfa, scales and oral harmony. 2. Singing. 3. Lyrical declamation. 4. Piano and harp. 5. Stringed instruments. 6. Wind instruments. 7. Thorough bass, organ, and composition. 8. Dramatic declamation.

There are also courses of popular singing for adults, superior to those in the common schools.

The actual classes are, or were not long since:—

- 2 for Solfa, number of pupils unlimited.
 - 12 for do. for individual practice, twelve pupils in each, limited to two years' duration.
 - 1 for Oral harmony.
 - 5 for Scales, 2 male, 3 female, limited to 8 pupils each.
 - 8 for Singing, limited to 8 pupils each.
 - 1 for do. *en masse*.
 - 4 for Lyrical declamation.
 - 5 for Piano, limited to 8 pupils each.
 - 3 for Violin; 2 for Violoncello; and
 - 1 for each of the other instruments.
 - 1 for the performance of instrumental pieces.
 - 6 for Harmony and accompaniment, 4 male, 2 female, limited to 12 each.
 - 1 for Organ and Improvisation, 12.
 - 4 for Composition, subdivided into counterpoint, fugue, and ideal composition.
 - 8 for Dramatic declamation.
 - 1 for Deportment
 - 1 for Dancing
 - 1 for Fencing
- } For theatrical pupils.

LIBRARY.

There is a fine library of music, and of works relating to music and the drama, and this is open not only to the pupils but also to the public.

MUSEUM OF INSTRUMENTS.

There is a good collection of musical instruments attached to the Conservatoire, to which the public is admitted on certain days of the week.

ROOMS.

The Conservatoire is a very large establishment, and includes a complete theatre, a smaller theatre or concert room, and innumerable class rooms of all sizes besides the library, offices, and apartments for the in-door pupils.

COMPETITIONS.

The annual competitions now take place in July, instead of August. They commenced this year (1865) on the tenth and ended on the twenty-ninth of the month, occupying twelve days in all. With the exception of the classes for the organ, harmony and accompaniment, fugue, thorough bass, scales and solfa, the competitions are conducted in public. They take place in the theatre of the Conservatoire, erected in 1806, and in which are given the famous concerts of the society formed within the Conservatoire, but not being officially a portion of it. This theatre holds more than 900 persons, but in a most inconvenient manner, but the excellence of the building for sound has hitherto set aside all idea of its reconstruction. It is arranged like an ordinary theatre, with three principal tiers of boxes, a balcony in front of the lower tier, *boisnoires* around the pit, a gallery divided into boxes and stalls, a pit and pit stalls. The pit holds 150 persons, and there are 180 stalls. The form of the building is oblong, with circular ends, the stage and orchestra occupying more than half the whole area. The wall at the back of the stage is not in fact semi-circular but ten-sided. In the centre of the principal tier of boxes is the *loge-d'honneur*, which is the Imperial box for the concerts of the society, and for which the Emperor makes a donation of two thousand francs a year, and behind this is a good-sized antechamber.

PRIZES.

During the competitions this box with the antechamber are devoted to the jury, who, after listening to the performances of the pupils in one section or class, retire and decide on the awards before another class commences; each pupil to whom any award is made is then called forward, and the decision of the jury announced to him. If the award has been unanimous that fact is announced also. The prizemen in the instrumental classes, with the exception of the great instruments, receive an instrument as their prize, others receive books of music, and the pupils of the elementary classes medals. Each successful pupil receives a written diploma in addition.

JURY.

The Jury generally consists of nine members, chosen according to the nature of the competition of the day—whether vocal, instrumental, or dramatic—from a body of thirty.

There are, however, five members who are present on almost all occasions, viz.:—M. Anber, Director; M. L. Monnaix, Imperial Commissioner for the Lyric Theatre; M. Kastner, member of the Institute, composer; M. J. Cohen, composer; and General Mellinet, an eminent amateur and composer.

In addition to these gentlemen the following acted as members of the Jury during the competitions just concluded:—

M. Gabenis, Chef de Bureau of the Minister of Fine Arts (official); M. De Leuven, Director of the Opera Comique; M. Perrin, Director of the Grand Opera; and M. Haix, Conductor of the Grand Opera—(Ex-officio members: MM. Ambrose Thomas (member of the Institute), F. Barn Benoit, Dauvernoy, E. Jonas, Clapiisson (member of the Institute), Prumier, V. Masset, Pasdeloup, Elwart, and Cokken—Professors in the Conservatoire. MM. Watelin, composer; Rinaud de Vilbac, composer and pianist; Ravina, pianist; Wieniawski, pianist; Cuvillon, violinist; Léon Réquier (member of the Institute), Professor in the Collège of France; Colin, harpist; and Cremieux, composer.

As already stated, all the competitions are open to the public, with the exception of those amongst the pupils of the elementary classes; but in the case of opera, comic opera, and still more of tragedy and comedy, the demand for places is so great that the theatre is not half large enough to hold those who apply for seats and obtain them, as far as they go, by favour of the director. In the case of the vocal and instrumental competitions, the theatre is not half filled, and the military music attracts only the friends of the pupils themselves.

COMPETITION OF 1865.

Private (four days), prizes awarded:—

- Fugue—2 first and 1 second, males.
- Harmony and Accompaniment—1 first prize, divided between two young men; two first prizes to females.
- Harmony alone—1 first prize between two males.
- Scales—36 competitors, male and female; 7 third prizes to female pupils.
- Sol-fa—125 competitors; prizes, 8 first medals, 2 second medals, and 8 third medals to male pupils; 11 first medals (one gained by a child nine years old), 14 second medals, and 6 third medals to female pupils.

Public:—

Singing—(male classes) 20 competitors and 11 awards, viz., 1 first and 3 second prizes; "accessits," or honorable mentions, 8 first, 2 second, and 2 third; (female classes) 30 competitors and 17 awards, viz., 4 first and 3 second prizes; and 2 first accessits, 3 second, and 3 third.

Pieces—air, 2nd act "La Dame Blanche;" air, 4th act "Lucie;" air, "La Juive Moïse;" romances "Cenerentola;" air, "Macbeth;" air, "Traviata;" air, "Norma;" air (Joseph), "Vaniceunt Pharaon;" air (Mousquetaires) "Bocage épais;" air, "Fille du Régiment;" air, "Pré aux Clercs."

Violin—Piece selected, 8th Concerto of Rode, 23 competitors, male and female. Prizes, 3 first (1 female) and 1 second; 1 first, 1 second, and 1 third accessit.

Violoncello—8th Concerto de Romberg; 1 first prize, 2 second prize, and 1 accessit.

Opera Comique—This is the most popular portion of the competition, and also that in which the pupils are generally strongest. It was especially so this year. There were 22 competitors, male and female, and 17 awards, viz., male pupils, 1 first, 2 second prizes, 2 first, 3 second accessits; female pupils, 3 first prizes, 2 second prizes, and 2 first and 2 second accessits.

Acts and Scenes, performed as well as sung, in stage costume:—Scene from "Le Tableau Parant;" fragment of 1st act of "La Fiancée;" scene from "Les Dragons de Villars;" fragment from "Les Dragons de Villars;" finale of "Noces de Jeannette;" scene from "Noces de Jeannette;" scene, 3rd act, "Mousquetaires;" finale, 1st act, "Galathée;" operetta, "Le Chalet;" operetta, "Le Maître de Chapelle;" scene, "Barbier;" scene, 1st act, "Songe d'un Nuit d'Été;" and scene, "Toréador."

Piano—11 male and 35 female competitors. (This class is generally pronounced to have been weak.) Male pupils, 1 first, 2 second prizes; 2 first, 1 second, 2 third accessits. Female pupils, 3 first, 3 second prizes; 3 first, 3 second, 4 third accessits. Piece played by male pupils, "Concert Stück" (Weber); pieces played by female pupils, "Concerto in B minor" (Hummel).

Harp—4 competitor. 1 first accessit only awarded.

Opera—18 Competitors; awards, male pupils, 1 first prize (divided between 2 pupils), 2 second prizes; 3 first 2 second accessits; female pupils, 1 first prize (divided between 2 pupils), 1 second prize, 1 first, 1 second accessit. Acts and scenes given:—Last scene "Romeo et Juliette;" scene, "Robert le Diable."

Wind Instruments—Flute, 1 first, 1 second prize; 2 first, 1 second, 1 third accessit. Horn, 1 second prize; 1 first accessit. Clarinet, 1 first, 2 second prizes; 1 first, 1 second accessit. Bassoon, 1 first, 1 second prize. Hautbois, 1 first, 2 second prizes; 2 first, 2 second, 1 third accessit. Sarcophone, 1 first prize, 1 first prize divided in 2, 1 second prize, 1 second prize divided in 2; 3 first, 3 second, 3 third accessits. Saxhorn, 2 first, 1 second prize; 3 first accessits. Trumpet, 2 second prizes; 2 first, 1 second, 1 third accessit. Trombone, with alides, 1 first prize. Trombone-à-piston, 1 first prize; 1 first accessit. Cornet-à-piston, 2 first, 3 second prizes; 1 first accessit. The instrumental classes bear a high reputation.

Total Awards.

The total of the above awards is:—

	1st Prizes.	2nd Prizes.	3rd Prizes.	Accessits.
Harmony, &c....	6	1	0	0
Vocal music.....	11	13	0	31
Instrumental.....	19	24	7	50
Total.....	36	38	7	81

in addition to the medals given to the pupils in Sol-fa, 56 in number.

Two of the prize-holders were immediately engaged by the director of the opera, and are announced to appear in "Marie."

Distribution of Prizes.

The public distribution of the prizes took place on the 4th of August, under the presidency of Marshal Vaillant, the Minister of the Beaux Arts, supported by the First Chamberlain of the Emperor and Superintendent of the Theatres, Count Baciocchi; M. Camille Doucet, Director of the Theatres; M. Auber and all the principal professors; and the managers of the Imperial theatres.

The principal point in the President's Speech was that which referred to the fact of an augmentation in the grant to the Conservatoire having been made during the

last session of the Corps Legislatif, to the extent of £836, with the view of increasing the salaries of the professors.

The meeting concluded with the performance, by the pupils, of—A fantasia on the violin; an air from "Macbeth;" an air from "La Dame Blanche;" selections from "Le Barbier de Seville;" and selections from "Roméo et Juliette."

MISCELLANEOUS.

Common Schools.

A competition took place a short time since between the schools (communal) of the left bank of the City of Paris, in Harmony, Reading at Sight, Sol-fa, and Dictation. The Jury included—M. Victor Foncher, President of the Imperial Commission for Singing; M. Ambrose Thomas, General Mellinet, Edouard Rodrigues, Bazin, and others. There were distributed to certain schools—For adults, 3 first prizes and 2 second prizes. For boys, 3 first prizes and 1 second prize (divided). For girls, 1 first prize and 1 second prize.

Schools for Religious Music.

The competition amongst the pupils of the School for Religious Music took place on the 28th of July, under the presidency of M. Victor Hamille, Director of the Administration des Cultes, and M. Lefèvre Niedermeyer, the Director of the school. The following is the list of awards:—

Musical composition, counterpoint and fugue, harmony, organ (two divisions), plain chant, piano (two divisions)—2 prizes in each, first and second class; sol-fa—1 prize.

It is remarkable that of all the laureates only one was of Paris, the others were from Pamiers, Arras, Dijon, Montpellier and Cambrai.

International Competition at Cambrai.

The international competition took place at Cambrai, on the 20th of August last. Four thousand artists sent in their names for the competition. MM. Ambrose Thomas, Gounod, Bazin, Elwart, Gevaert, Laurent de Rille, Sernaet, and other well-known composers and professors, formed part of the Jury. The prizes were twelve "medals," of 300 francs each.

Payment of the Opera Band.

The members of the orchestra of the Grand Opera have lately petitioned for an increase of salary, which has not been accorded. It appears that ten only of the performers receive 2,500 francs (£100) each a year; eight, from 2,000 francs to 2,200 francs each; twenty-nine, from 1,300 francs to 1,800 francs each; thirty-four, 1,200 francs each; one, 1,100 francs; one, 950 francs; and one, 750 francs. The petitioners asked for a slight rise in the higher salaries, and that each artist playing instruments, in the case of which a competitive examination is enforced, shall have at least 1,800 francs per annum. Amongst the solo players at the opera at the present moment are:—Flute, M. Dorus; Horn, M. Mohr; Cornet-à-piston, M. Forestier; Trombone, M. Dieppo (Professors at the Conservatoire); and MM. Alès, Cras, Berthélemy, Leroy, Rose, Maury, Lendet, and Garcia. The whole of these gentlemen are members of the Society of Concerts in the Conservatoire, and of the Imperial Chapel band.

The performances at the Opera occur three times a week besides Sundays.

Commerce.

THE SUGAR TRADE.—The news of the French beetroot crop (say Messrs. Travers) continues to be favourable. The weather is beautiful, and, from the drought, little else can be done in the fields, so that the roots are being rapidly taken up and sent to the factories. Growers wish to profit by the unusually good condition of the root, and the facilities for transport given by the long days and fine weather. "Caution should be used, however," says the *Journal des Fabricants de Sucre*, "by the makers in taking

in supplies, for it is doubtful whether the root will keep long in weather like the present—a burning sun, and nights not yet cooled by the autumn frosts. As to the result of the manufacture, it is as yet too early to give an opinion, but, notwithstanding some complaints of a want of density in the juice, there is ground for believing that a better yield than last year's will be obtained. The season 1865-6 thus commences under favourable circumstances, and bids fair to be highly remunerative to the growers, the makers, and to France at large. The news from Germany is also improving. The misfortunes of the summer have been to a considerable extent impaired by the late superb weather, and even the field injured by the grey worm look far better than could have been expected some time since. An average harvest of the root is looked for in Germany. The reports as to the saccharine richness of the juice differ greatly, but there is as yet little authentic information to be had, as most of the makers have put off commencing work for some weeks later than usual, in order to let the root benefit as much as possible by the favourable weather. In Silesia, however, it is ascertained that the juice is very rich and easy to work. Fourteen and even 14.5 per cent. of sugar is shown by the polariscope to exist in the juice, in by no means rare cases." While the prospect of the crop is thus generally favourable, its abundance has created alarm in the French market, where a perfect glut of sugar appears to be anticipated. The rise in the price of cane sugar in England, while in France the advance has been to nothing like the same extent, has called the attention of English buyers to the French market; and large purchases have been made of cane and beetroot sugar for our ports. This new outlet has given more confidence to the French makers, and has enabled many of them to make remunerative contracts. The purchases of refining kinds of beetroot sugar for Great Britain have been large, but we believe that the orders have principally come from the Clyde. We hope, however, at a not distant date, to see crystallised beetroot sugar, suited for direct consumption, regularly offered in this market. Pieces have already been sold for forward delivery in this market. White crystallised sugar is now quoted at 35fr. the 50 kilos. in Paris, or about 43s. 6d. here; and even if there is not sufficient margin between prices in the two countries at present, we shall probably before long see fine French sugar, defying the higher duty and competing with our refiners' goods in moist as well as stoved kinds. It is certainly a remarkable fact that the foreign refiners, in spite of the charge for freight, the 12s. 10d. duty, and the equitable drawbacks supposed to be established by the Convention, should be enabled to beat our refiners in their own markets. We Englishmen, in our national pride, are too apt to pre-suppose that we can beat all foreigners in machinery and its applications to our own particular province. But this over-confidence in our own merit has lately had some severe shocks, in the inability of English to compete with foreign machinists in supplying locomotive engines and other machines. Presumptuous persons have even ventured to hint that we are far inferior to the French, and even to the Scotch, in everything connected with sugar-making; but the chilling reception given to their insinuations has discouraged a repetition of the attempt to shake the confidence of Londoners in the skill of their countrymen. The foreigners certainly use a far better class of sugar for refining, and it would be worth while to find out why they do so. Is it because the continental consumption of brown sugar is limited, and that in consequence of this fact the refiners buy a strong and fine sugar in order to leave as little pieces as possible? If this explanation be correct, it is evident that the reason of the foreigners making cheaper sugar is found; for in order to enable the pieces and bastards left after extracting the loaves to compete with raw sugar, the London refiners have been obliged to sell the lower products at little or no profit, and to get their profit from the stoved sugar. The English public

use brown sugar in very large quantities, and there is thus some apparent justification for the practice of buying comparatively low qualities at a cheap rate, with the view of supplying the consumption of brown as well as of white sugar; and the system, though wrong in theory, answered very well while an extra protection duty was levied on foreign refined. Since the imposition of the 12s. 10d. a place of the 18s. 4d. rate, the practice has to some extent been abandoned by our refiners, to enable them to keep the Dutch and French goods out of the market, but we might surely with profit use a stronger sugar for refining. Some light has recently been thrown on the kinds most suited to the refiner by the examinations carried on with polarized light by M. Emile Monier, into the constitution of sugar, and published in his work, "Guide pour l'Analyse des Sucres." (Paris: E. Lacroix.) This book contains a perfect mine of information for refiners, and it would seem that the polariscope, or optical saccharometer, by which the results given are arrived at, is not only well known among us as it ought to be. By the use of this delicate instrument the saccharine richness of sugar can be shown to the minutest fraction, and the system of classification by shades of colour, or of types, is shown to be entirely delusive. A yellow sugar, of which the crystals are clear and good, is often richer than a white sugar of which the crystals are hardly formed, or badly defined. The richness also varies in samples of sugar of the same shade of colour. Thus, No. 12 of French beetroot sugar contains from 92 to 97 per cent. of crystallizable sugar—a difference of 4 per cent. in richness at a margin of 4 francs in the buying price. At the same time this sugar (No. 12), when good, contains 97 per cent. or the same saccharine richness as some samples of No. 18 and 19, worth 4s. or 5s. per cwt. more in the market. We propose to return to the light thrown by M. Monier's figures on the sugar duties in a future article and at present to notice his conclusions on the relative richness of sugar. M. Monier states that beetroot sugar, as presented in the market, is richer than any other kind of saccharine matter, and gives the greatest yield when refined. The principal distinction between cane and beetroot sugar is, that the former contains 10 to 15 times as much glucose or incrustable sugar. Independent testimony to the superiority of the beetroot to the cane sugar is given by Mr. Barron, in his report upon the Belgian Sugar Industry ("Reports of the Secretaries of Legation," No. 6, page 208:—"Beetroot sugar is preferred by the refiners for the volume and whiteness of its yield. In refining it gives a much larger yield in law than Havana or Jamaica sugar." After the beetroot, M. Monier places the sugars of Java, Cuba, Mauritius, &c. Bourbon; and last, those of Martinique, Gaudaloupe, and Porto Rico. We should be curious to know where M. Monier would place the lower classes of British West India sugars, on which he has apparently made no experiments. We fear they would end his list. These analyses throw considerable light on the question why the foreign refiner can produce loaf sugar more cheaply than the English—it is by the use of beetroot. Java, Cuba, and Mauritius sugars—instead of incrustable kinds. The interest taken by the trade in the import of beetroot will be added to, as the refiner makes more loaf sugar from it. With some approach to free trade in sugar, English refiners must be ready to make changes in their manufacture, or they will continue to lose ground. In the revenue returns for the year 1864-5, a charge appears for native British sugar, and this item has given rise to some speculation, on the part of those interested in the subject, as to whether beetroot had again been introduced in England. That starch sugar was made in this country was certainly not generally known, as it was thought that the manufacture was prohibited by the excise. The following extract from the *Times*, however, shows that a general misapprehension existed on the subject:—"British-made sugar has long held a merely nominal place in our list of excisable articles, but in the past year two new

factories of glucose, or starch sugar, have been established in London. The quantity brought to charge in the financial year 1864-65 was 1,064 cwts. The materials from which this sugar is made are chiefly sago and potato starch. It has but little resemblance to cane sugar, and is sweeter than the lowest class of colonial sugars. The rate of duty with which it has been charged is 9s. 4d. per cwt., being that on yellow Muscovado, or brown clayed sugar. It is stated that it is intended to be used in brewing. The imposition of the 9s. 4d. rate on sugar possessing so little saccharine matter gives a new instance of the injustice of the scale of duties.

Colonies.

WHEAT IN SOUTH AUSTRALIA.—The acreage of the wheat crop last year amounted to 390,836 acres, or two-thirds of the total cultivated land. In 1863-4 there were 35,758 acres under wheat, or 60 per cent. of the tilled and ; the increase this season, therefore, amounts to 6 per cent. The total produce of the harvest was 4,252,949 bushels, compared with 4,691,919 bushels in the yield of the previous harvest, showing a decrease of 438,970 bushels, the average yield per acre being only 11 bushels against 14 bushels last, and one bushel less than the average of the last seven years. There is no doubt but that at the low average of the South Australian wheat crop, owing to the imperfect cultivation of a great portion of the land ; many small holders are compelled to plough and sow the same ground year after year, without any intermission or attempt to replenish the soil by fallowing or other means, resulting in a very low return, and thus reducing the average result of the whole colony, which is invariably exceeded by the better class of farmers, whose more extensive holdings enable them to pursue a systematic plan of operations, in which more careful tillage, rest for the soil, and a combination with stock farming are stated to be essential to, and generally productive of, success. Seven-eighths of the wheat crop was reaped by machine, being less than last year, notwithstanding the increased cultivation. The most important advantage our farmers possess over those of the sister colonies is the expedition and economy with which their crops can be gathered, owing to the successful method of the reaping machines now universally used on all but stony ground, permitting of the grain being reaped, winnowed, cleaned and bagged on the harvest-field, and removed into the store ere the day is closed. The high prices ruling for wheat have caused the farmers to look more particularly to their grain crop for profit, and had the effect of reducing the breadth laid down for hay by 1,020 acres, the total area sown being only 66,570, compared with 75,590 acres the previous year ; and, as the average yield was 4 cwt. less—say 23 cwt. instead of 27 cwt. per acre, the deficiency in the crop is very large, no less than 25,637 tons ; the total quantity grown being 1,656 tons, against 102,293 tons in 1863-4, showing a falling off of one-fourth.

EDUCATION IN SOUTH AUSTRALIA.—The Report of the South Australian Board of Education for the year 1864 has been published in the Colonial Government Gazette. It shows that during the year there was an increase of 20 schools and 1,190 scholars on the previous year. The average number of schools for the year was 258, and the number of scholars on the rolls, 11,511, being an increase of 817 scholars on the previous year. The following table exhibits the number of scholars at their most favourable season, with their increase or decrease on the previous year, the number of licensed teachers being equal to the number of schools :—

	Boys.	Girls.	Total.
Adelaide ...	989	624	1,503
Corporate Towns ...	631	303	934
Country ...	5,476	4,926	10,402
	7,046	5,913	12,959

The amount expended by the Board in stipends to teachers was £12,914, or on an average £48 7s. 4d. for each teacher, and an average of 19s. 11d. for each scholar, against £1 3s. for the year previous. The aggregate amount of school fees received by teachers from parents, &c., of 11,954 scholars, not including 1,005 destitute, for which the fees are paid by the Board, nor for evening scholars, was £12,555 10s. The entire cost of education at the public schools, exclusive of all expenses, is shown to be £26,476 3s., or an average of £2 0s. 10d. for each scholar, against £2 1s. for 1863. This also gives the entire average receipt of each of the 258 teachers, the average number for the year £102 12s. 4½d. against £101 7s. 7d. for 1863.

Notes.

PARIS EXHIBITION OF 1867.—The Imperial Commission has confirmed, by public notification, the report concerning the plan to be adopted with respect to the motive power to be employed at the Exhibition. Instead of concentrating the generators and motive engines on one spot, as in the case of former Exhibitions, the Imperial Commission deems it preferable to distribute them in several distinct buildings around the palace, in order to give increased facilities, and at the same time more security against accidents or interruption in the service. It has decided also that the power shall be supplied, not by the Commission, but by private engineers and contractors, who will be invited, on certain conditions, to set up one or more groups of generators, with all the necessary means of transmitting power to the machinery to be driven. The contractors for this service will, as far as possible, be taken from the body of French and foreign exhibitors, and the boilers and driving machinery will form an integral portion of the Exhibition. The duty undertaken by each exhibitor of motive machinery is to be explicitly noted in the catalogue. The power may be obtained by steam or any other means offering sufficient guarantees. Of course, the exact details of the work to be undertaken cannot be given until the arrangements are more advanced, but those who desire to tender for the supply of motive power may consult a statement of the general conditions laid down by the Commission for such service, and now lying for reference at the offices of the Commission at the Palais de l'Industrie, in the Champs Elysées.

EXHIBITION OF FISHING APPLIANCES.—The Prefect of the Pas de Calais has established an international exhibition of fish and fishing appliances at Boulogne-sur-Mer, under the patronage of the Marquis de Chasseloup-Laubat, Minister of Marine. The object of the Prefect is to give the fishermen in his department an opportunity of learning the manner in which fish are caught in other countries, both in salt and fresh water. It may be interesting to state that the Society of Arts, nearly one hundred years since, opened an exhibition of a similar character at its house in London, for the purpose of instructing English fishermen in the methods employed by the Dutch in the turbot fishery, which was at that time wholly in their hands. And further, the Society offered the sum of £500, to be awarded as prizes of £5 and £3 for each hundred of fish of given size, caught and brought to shore by English vessels. In order further to facilitate the learning of the art, each vessel was allowed to have one foreigner on board.

ASYLUM FOR THE MIDDLE CLASSES.—There exists in Paris and in other parts of France many excellent establishments for the relief of persons of small income, some of which take the form of hospitals and lunatic asylums, (maisons de santé), while others serve as retreats for the aged. One of the latter class has just been opened at Auteuil, near the Bois de Boulogne ; it was established by the Administration of Public Assistance, with funds given by a gentleman and lady named Chardon-Lagache. The new asylum receives married couples, as well as single

persons, and the expenses are defrayed half by the inmates themselves or their friends, and half from the funds of the foundation. The establishment is arranged to accommodate two hundred persons, and it is already half full. The cost of the building—defrayed entirely by Monsieur and Madame Chardon-Lagache—was upwards of £60,000, and the ground upon which it stands—given by the Administration—is valued at about one-third of the above sum. The new asylum was formally inaugurated last week, in the presence of the founders and of the officers of the Administration, and the chapel appertaining to it was consecrated by the Abbé Surat, Archdeacon of Notre Dame.

NAMES OF STREETS IN PARIS.—An old street, with a long antiquated name, *Rue des Écuries d'Artois*, so called from the fact of the stables of the Count d'Artois having originally occupied the site, is to be re-christened after the poet and romancist, Alfred de Vigny, who resided there for forty years in the same house. Few literary men have left a brighter or purer name than Alfred de Vigny. Many streets and boulevards in Paris are named after literary and scientific celebrities, French and foreign. Arago, Balzac, Byron, Béranger, Boileau, Beaumarchais, Bossuet, Buffon, Chérubini, Crébillon, Chateaubriand, Cuvier, Dalember, Descartes, Dupuytren, Fénelon, Fontaine, Fontenelle, Franklin, Fulton, Geoffroy St. Hilaire, La Harpe, Jacquard, Rousseau, Jean Gougon, Jussieu, La Bruyère, La Fontaine, Lavoisier, Richard Lenoir, Lulli, Masillon, Molière, Montesquieu, Montgolfier, Newton, Pascal, Rabelais, Racine, Réaumur, Regnier, Rossini, Say, Sedaine, Thénard, Watt, Volta, Voltaire, and many more. It is a popular and most economical mode of keeping the names of great men in the mind of the people.

INTERNATIONAL POSTAL ARRANGEMENTS.—The French government loses no opportunity of improving its postal arrangements with foreign countries. Three decrees have just been published respecting conventions made between Switzerland, Prussia, and France. On and after the 1st of October, in the present year, the postage of a single letter weighing ten grammes, the third of an English ounce, passing between any part of France or Algeria and Switzerland, will be reduced to thirty centimes; at present the charge is equal to four pence per quarter ounce. At the same time, post-office orders will be exchangeable between the two countries, as they already are between France and Italy. The still more recent convention between France and Prussia will make no alteration in the postage of letters as regards Prussia proper, but will allow of the transmission of commercial and business papers at the rate of fifty centimes per two hundred grammes, or about five pence for rather more than six ounces and a half; it also establishes the exchange of money orders, not only between France and Prussia, but also between the former and the other States of Germany served directly by the Prussian post. No order is to exceed two hundred francs in amount, and the tare is fixed at twenty centimes for every ten francs. The establishment of the system of post-office orders between these four countries—France, Italy, Prussia, and Switzerland, affirms the principal of small payments by the means of the post, and there is little doubt that before long it will be extended over of the whole of Europe.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following report was drawn up in the Ministry of Public Education in Prussia, and has been received, through Earl Russell, from Her Majesty's Ambassador at Berlin:—

PRUSSIA.

The study of music in Prussia enjoys a considerable range, in consequence of the numerous private establishments, whose founders and managers do that which in many other states is done by public academies (*conservatoires*) at the expense of the State. Of such private establishments there are, for example, the Conservatoire of Music of Dr. Stern, the new Musical Academy of Professor Rullack, the Singing Academy, under the direction of Professor Grell, in Berlin, as well as the Conservatoire of Music in Cologne, founded by a company (*Verein*) of friends of music, which is under the Director of Music, Herr Hiller. There is no want of similar private institutions in other larger provincial towns. No official reports are made upon them. Occasional reports are made in the programme of the Stern and Rullack establishments. Till now there has been no State conservatoire for music in Prussia, and state money has only been exceptionally applied to such musical educational establishments, and more frequently for the support of extraordinary talents. With reference to the government provision for musical students, the Senate of the Berlin Academy of Arts has a section, whose members, Messieurs Bach, Grell, and Taubert, conduct the musical division of the Academy. The annual cost of this division, in which instruction is given in the theory of music and the art of composition, amounts to about 1,800 thalers. The number of pupils is not fixed.

In the Royal Institute of Church Music at Berlin, under the direction of Professor Bach, with four teachers, instruction is given to twenty pupils in organ playing, pianoforte playing, violin and singing, gratis, as well as in the theory and the history of music. The annual expense of this institution amounts to 2,897 thalers.

One academical musical institute exists at the Royal University at Breslau, having one director and two teachers, with salaries amounting to 450 dollars, and a similar one at Königsberg, with two teachers. Other universities have likewise offices of teachers of music.

Singing forms an element of education, at gymnasias

schools, and other educational establishments. Instruction in music, that is, in organ playing, pianoforte playing, violin playing, and singing, is given in the school-teachers' seminaries, at which the organists and choristers are educated, theoretically and practically, in music. Besides the above-named teaching schools of this character, there is a formation school for singing for the persons belonging to the cathedral choir (*dom choir*), and one for singing and instrumental music at the Royal Opera.

Berlin, the 5th July, 1865.

For the Minister of Public Education,

(Signed)

LEHNERT.

To His Excellency Monsieur de Bismarck.

Proceedings of Institutions.

SOUTH STAFFORDSHIRE EDUCATIONAL ASSOCIATION.—The sixth annual meeting was held on the 4th October, under the auspices of the Willenhall Literary Institution, which last year invited the Society to pay a visit to Willenhall. Lord Lyttelton, who has been the President of the Association from its establishment, presided, and was supported by the Earl of Lichfield. The following delegates from Institutions were present:—Stourbridge Ironworks Institute, Mr. George Hipwood, Mr. Robert Bill. Messrs. Chance's Library, Mr. F. Talbot. West Bromwich Christian Institute, Mr. Henry Ward. Wednesbury Mechanics' Institute, Mr. Sampson Lloyd, and Mr. R. Williams. Wednesbury Working Men's Club, Mr. Weimpress and Mr. Davies. Bilston Working Men's Club, Mr. John Hague. Bilston Institute, Rev. J. W. Bain and Mr. J. C. Tildesley. Willenhall Literary Institute, Mr. Chapelle. Dudley Geographical Society, Mr. H. Beckett and Mr. James Solly. Dudley Mechanics' Institute, Mr. E. Hollier, Mr. A. Shadden, and Mr. J. Williams. Pensnett Night School and Club, Rev. C. Farmer and Mr. Atkins. Woodside Mutual Improvement Society, Mr. Crompton. Cradley Heath Working Men's Club, Mr. Tromans. Congreaves School, Mr. S. Griffiths. Gold's Hill, Rev. F. P. B. Hutton and Mr. Crabtree. Stourbridge Associated Institute, Rev. D. McGinnis, and Mr. W. Ryder. Kinver Young Men's Institute, Mr. Thomas Bolton, Mr. W. Yeomans, and Mr. B. Williams. Wolverhampton St. Peter's Night School, Rev. J. H. Iles. Walwall Church Institute, Mr. Vaughan and Mr. Webb. Wolverhampton Working Men's Club, Mr. Powell and Mr. Wilkins. Oldbury Working Men's Club, Mr. Spencer. Mr. Jones, the secretary of the Association,

read the report, of which the following is the substance:—"During the greater portion of the past year the operations of the Association have been carried on under considerable disadvantages, and the actual results of the past season are not, on the whole, so satisfactory as they have been in some previous years. At the time of the last annual meeting, the district was agitated by one of the severest labour disputes on record, and this was barely settled before a somewhat similar disturbance took place in another branch of the staple industries of the locality. The natural results of these contests between masters and men had the effect of diverting the attention of each body from any movement of a philanthropic or educational character. It is, however, highly satisfactory to find that, notwithstanding these adverse circumstances, institutions and evening schools were able to hold their ground, and the gross results of the year's work are much higher than might have been expected. After describing the Willenhall Institute building, recently opened, the report says the number of members has increased from 150 to nearly 400. At Brierley-hill, a public company has been formed for the purpose of erecting suitable institute accommodation, and the buildings are in active progress. At Oldbury, a Working Men's Club has been commenced, and is reported in a satisfactory condition. The Athenæum of Wolverhampton has been considerably enlarged, a commodious reading-room has been formed, and, as an amalgamation has been made between this society and the Alliance Literary Institute in the same town, the total number of members has greatly increased during the year. The St. John's Working Men's Club, Wolverhampton, has been in active and successful work throughout the whole year. On the other hand, the reports received from several institutions are of an unsatisfactory nature. The Wolverhampton Working Men's College has been suspended, owing to lack of students; and thus one of the most useful agencies in the district has, for a time at least, ceased its operations, which have been carried on with the most gratifying results for upwards of eight years. The Alliance Literary Institute and Christian Association, in the same town, has also broken up. Several other societies report that it is with difficulty that they have been able to keep open their doors at all, and state that if, in the approaching season, they are not more successful, they will be compelled to close. Though the general work carried on by institutions was not, on the whole, of a satisfactory nature last year, it is pleasing to note the number of evening schools throughout the district increased. The examinations carried on by the Association have been this year attended by a smaller number of candidates than last year. This diminution is from evening schools, and arises from the fact that the pupils from the Dudley Mechanics' Institution and the Ambleside Night School were examined by means of the Worcestershire Union Local Boards, though they worked the same papers. Several institutions are in union with both Unions of Institutes, and can elect to be examined by either. The total number attending the elementary examinations was this year 122, and of these 72 were placed upon the class list. The examiner states that he is able to report favourably of the quality of the answers of those candidates who have been successful; the best are very good indeed, and the whole of the first class in each grade are praiseworthy. For the Society of Arts final examinations the number of successful candidates was this year 54, but among these none obtained the distinction of a prize. The examinations of the Science and Art Department were attended by upwards of 50 students, and of these more than 40 were placed on the class list. Certain modifications having been suggested in the method of distributing the prizes and certificates to the successful candidates, it has been resolved, should it be approved at this meeting, to merely give out the local certificates, &c., at the place where the annual meeting is held, but to send the others to each examination centre, and to request the local board in each place to organise a public

distribution meeting. As representations have been made from the managers of evening schools, &c., that a considerable stimulus would be given to the members preparing for the examinations were prizes offered to the candidates appearing at the head of each class list, the committee have resolved to expend a sum not exceeding £20 in such prizes at the examinations to be held in March next. With respect to the future work of the Association, it is proposed to hold during the winter a series of meetings somewhat similar to the one referred to as having been held at Wednesbury in February last. Arrangements have been made to have a conference and public meeting at Bileton, in November; and the committee suggest to managers of institutions the great desirability of having such meetings annually, at the commencement of the winter season. They also propose to hold during the winter several meetings of secretaries, in order to obtain frequent interchange of opinion upon the most important matters affecting institution work, and to issue occasional papers, in which the proceedings of the associated institutions will be briefly recorded. In giving effect to these proposals, the active co-operation of the managers of institutions is particularly invited, as without their zealous assistance and united action throughout the whole district they can hardly expect that what they are intending to do will be successful. The committee hope that by these and other means the institutions of the district may be encouraged to more energetic action during the present winter, and that at the next meeting of the Association the reports presented may be of a more uniformly satisfactory character than they have been for the past season."

EXAMINATION PAPERS, 1866.

(Continued from page 682.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

SPANISH.

THREE HOURS ALLOWED.

PART I.

Candidates for the First-class Certificate will have to translate the following passage into Spanish, to render into English or French the idiomatic phrases, and to write a short essay:—

Lope de Vega is called a prodigy of nature, and yet he really may be reckoned, not that we can ascribe to him a sublime genius, or a mind abounding with fine original thought; but his fertility of invention and readiness of versifying are beyond competition. He required no more than four-and-twenty hours to write a verified dramatic three acts, interspersed with sonnets, and abounding in intrigue. This astonishing facility enabled him to supply the Spanish theatre with more than two thousand original dramas. In general the theatrical manager carried away what he wrote before he had even time to revise it; and immediately a fresh applicant would arrive to press him to commence a new piece. According to his own opinion he wrote on an average five sheets a-day, so that he must have written upwards of 21,300,000 verses.

This peculiar gift of rapid composition will appear more extraordinary when we attend to the nature of Lope's versification. At every step we meet with acrostichos, echoes, and compositions of that perverted and laborious kind, which, though they require no genius, exact much time that one should think such a voluminous poet could little afford to waste.—*Hallam's History of Europe.*

CHURCHES.

Translate into English—El rey Don Alonso de Aragon decia que cinco cosas le agradaban mucho; y lena se le preguntar; caballo viejo para cabalgar, vino anejo para beber, amigos ancianos para conversar, y libros antiguos para leer.

Un letrado leyendo un libro de secretos naturales en que decía que el hombre que tiene la barba ancha es rasenal de muy necio, tomó una vela en la mano para mirarse á un espejo, porque era de noche, y quemóse por descuido la mitad dela barba, y escribió luego al margen, *Probatum est.*

IDIOMA.

1. Ladrar contra la luna.
2. Dorar la pildora.
3. Piedra que rueda no oje muago.
4. Buscar cinco pies al gato.
5. Tener un pie en la sepultura.
6. Dar palo de ciego.
7. Al buen entendedor pocas palabras.
8. Despedirse á la francesa.
9. Nô hay que mentar la roga en casa del ahorcado.
10. Por el dinero baila el perro.
11. En el país de los ciegos el tuerto es el rey.
12. Hacer el caldo gordo.

PART II.

Candidates for the Second-class Certificate will have to translate six or seven of the above idioms, the following extract of Gil Blas, and the examples for the elucidation of grammatical questions:—

Blas de Santillana, mi padre, despues de haber servido muchos años en los ejércitos de la monarquía Española, se retiró al lugar donde habia nacido. Casóse con una aldeana, y yo nací al mundo diez meses despues que se habian casado. Pasáronse á vivir á Oviedo, donde mi madre se acomodó por ama de gobierno, y mi padre por escudero. Como no tenían mas bienes que su salario, corría gran riesgo mi educación de no haber sido la mejor, si Dios no me hubiere deparado un tío que era canonigo de aquella Iglesia. Llamabase Gil Perez, era hermano mayor de mi madre, y habia sido mi padrino. Figurate allá en tu imaginación, lector mío, un hombre pequeño, de tres pies y medio de estatura, extraordinariamente gordo y con la cabeza zabullida entre los hombros, y hé aquí la vera efigie de mi tío. Por lo demas era un eclesiastico que solo pensaba en darse buena vida, quiero decir, en comer y tratarse bien para lo creal la suministraba suficientemente la renta de su prevenda.

1. Name the neuter article in Spanish. Example—Youth has not foresight of the future, experience of the past, nor moderation to conduct itself in the present.

2. What are the rules as to placing the adjectives before their nouns? Examples—The experienced pilot perceived (from afar) the towering summits of the mountains of Leucaba. The mild zephyrs, more powerful than the burning beams of the sun, preserved a grateful coolness.

3. When is the passive voice in English expressed in Spanish by prefixing the pronoun *se*? Examples—It has been said that the enemy will be surprised. The victory would have been gained by us, if our troops had not been twice repulsed.

PART III.

Candidates for the Third-class Certificate will have to translate half of the above extract from Gil Blas, to answer the grammatical questions, translating into Spanish their examples, and the following phrases:—

Let us have more indulgence. In order that I may have a benefice. The mother must have a mild temper. Are you right in telling such a history? I am wrong in speaking to you. Will your children be afraid at home? We are neither right nor wrong in hearing his reproaches. Let them all suffer the punishment, though only one may deserve it. Many shut their ears to the voice of conscience. They distribute their property among the poor. From that place they hear every thing easily. He died the following day. The groans attracted the attention of the hearers.

FREE-HAND DRAWING.

THREE HOURS ALLOWED.

Make a copy of the whole or part of one of the drawings which you have brought with you, so that the Examiner

may judge whether the original work is your own doing. If you have not brought a drawing make a repetition from memory of any studies you have made during the last twelve months; the original drawings should be sent in afterwards.

DIRECTIONS FOR THE LOCAL BOARDS.

Notice should be given to the candidates for examination in free-hand drawing, that they should bring any studies which they have finished during the last twelve months, as proofs of their abilities.

NATIONAL PORTRAIT EXHIBITION IN 1866.

In accordance with the suggestions made in a letter from the Earl of Derby, published in the *Journal* in June last (p. 541), the Lords of the Committee of Council on Education have determined to hold a National Portrait Exhibition at South Kensington, in the arcades overlooking the Royal Horticultural Society's Gardens, which will be opened in April, 1866. A Committee of Advice has been constituted, consisting of the Trustees of the National Portrait Gallery and other noblemen and gentlemen, the Earl of Derby being president.

The following are the arrangements accepted for the Exhibition:—

1. The Exhibition is specially designed to illustrate English history and the progress of art in England. It may be divided into two or three sections, representing distinct historic periods exhibited in successive years, depending upon the number of the portraits received and the space available for their proper exhibition.

2. It will comprise the portraits of persons of every class who have in any way attained eminence or distinction in England, from the date of the earliest authentic portraits to the present time; but will not include the portraits of living persons, or portraits of a miniature character.

3. In regard to art, the works of inferior painters representing distinguished persons will be admitted; while the acknowledged works of eminent artists will be received, though the portrait is unknown, or does not represent a distinguished person.

4. The portraits of foreigners who have attained eminence or distinction in England will also be included, with portraits by foreign artists which represent persons so distinguished.

5. The Exhibition will be held at South Kensington, in the spacious brick building used for the refreshment rooms of the International Exhibition in 1862; and these galleries, which are perfectly dry, will be fitted up expressly for the Exhibition, and patrolled day and night by the police.

6. All charges for the conveyance of pictures accepted for exhibition by the Committee will be defrayed by the Department of Science and Art.

7. The Exhibition will be opened early in April, 1866. The portraits, for the purpose of proper arranging and cataloguing, will be received not later than the second week in February, and will be returned at the end of August at the latest; but, although the Exhibition will continue open till that time, any owner who requires the return of his contributions at the end of July will have them forwarded to him at once.

8. In accordance with the usual practice, the Science and Art Department, unless the owner objects, will take photographs of such portraits as may be useful for instruction in the Schools of Art, and allow them to be sold in the Museum; but no permission will be granted to any private person to photograph, without the owner's express sanction. Two copies of each photograph taken will be presented to the owner of the picture photographed.

9. As was the case at the Exhibitions of 1861 and 1862 (and as is usual at the Royal Academy and other exhibitions), the department cannot be responsible for loss or damage, but every possible care will be taken of works

lent; and it may be added that the numerous paintings lent for exhibition in 1862 were collected and returned by the same agency as will be now employed, free from any injury or damage of any kind.

10. All correspondence marked on the cover "National Portrait Exhibition," should be addressed to the Secretary of the Science and Art Department, South Kensington Museum, London, W.

Mr. Samuel Redgrave, to whose valuable labours the successful formation of the collection of portrait miniatures is chiefly due, has undertaken the special charge of directing the Exhibition, and Mr. Sketchley will act as Secretary.

BRITISH ASSOCIATION, 1865.

ON CHAIN-TESTING MACHINES. BY SIR W. G. ARMSTRONG, C.B.

The following paper was read before the Mechanical Section:—

The engineering firm of which I am a member, having been entrusted with the construction of the apparatus for testing chain cables and anchors, lately established at Birkenhead by the Mersey Harbour Trustees, had occasion to enter into a very careful consideration of the conditions requisite for effecting the operation in the best possible manner. As public attention has been forcibly directed of late to the importance of more accurate methods of testing chains and anchors, a few observations on the subject of the Birkenhead machine will not at the present moment be mistimed.

The most important consideration in the construction of a chain-testing machine is to obtain an accurate indication of the strain upon the chain. The hydraulic press has been for many years the appliance usually employed for exerting the strain, and nothing can be better fitted for the purpose; but the methods of determining the amount of the strain have been extremely imperfect. Most commonly the strain has been estimated by the indications of a mitred valve pressed down by a lever and weight. The impossibility, however, of restricting the tightening surface of the valve to a definite annular line, so as to exclude any variation of area, rendered this mode of indication highly delusive; so much so, indeed, that the attendants generally paid more regard to the indication afforded by the crackling of the scale on the surface of the iron than to the amount of load upon the valve. By substituting a loaded plunger for a loaded valve the uncertainty arising from variability of surface is obviated, but a plunger requires a packing to make it water-tight, and the effect of the friction of this packing has to be considered in relation to the friction of the press. A plunger without friction would give untrue indications of the strain, unless the press were also without friction; but friction cannot be avoided in the press, and therefore friction becomes a necessary element of accuracy in an indicating plunger. To make this more apparent it is only necessary to consider that in the press the friction of the packing lessens the tension exerted on the chain, while in the case of the indicator the friction of the packing lessens the weight necessary to indicate the pressure. If, therefore, these two frictions be in harmony, the load on the indicator will be diminished in the same proportion as the tension on the chain, and thus a direct indication of the strain upon the chain will be obtained.

The proper and usual packing for the hydraulic press is a cupped leather, but as the lip of the leather is pressed against the surface of the ram by the action of the water, the amount of its friction varies directly as the pressure. It is therefore necessary that the indicating plunger should also be packed with a cupped leather, in order that its friction may likewise vary directly as the pressure. But as the ratio of circumference to area is very much greater in the small ram of the indicator than in the large

ram of the press, it is obvious that with similar leathers the relative friction would be widely different in the two cases. The friction may, however, be brought to a proper adjustment by reducing the breadth of the lip in the leather of the indicator until its friction is in unison with that of the press leather. This adjustment should be made when the press ram and the indicator plunger are both perfectly clean and free from any lubricating substance, and in no subsequent use of the machine should either oil or grease be applied to these parts. The effect of employing a lubricator is to diminish the friction in the first instance, but afterwards to increase it, because the unctuous character of the lubricant is soon exchanged for a stickiness which produces an opposite effect. In fact, when grease or oil are used the frictions become so irregular as to render impossible an accurate correspondence between the press and the indicator.

There is another desideratum in the testing of chains which requires a further elaboration of the indicating apparatus. When a chain breaks in the test it is desirable to show not only that it failed to bear the full test area, but also what was the amount of strain exerted at the moment of fracture. In the case of the Birkenhead machine, various indicators, upon the principle of those commonly used for steam pressure, were tried for the purpose of effecting this latter object, but none of them gave satisfactory results. An apparatus was therefore designed for the object, which has since come into very general use, under the name of the "pendulum indicator." In its apparatus the pressure upon the indicating plunger is exhibited by the travel of a pendulum through a graduated arc. The movement is communicated to the plunger to the pendulum through the medium of a compound lever. When a chain breaks the pendulum falls back until stopped by a ratchet, but leaves a mark at the exact point on the scale attained by the pendulum at the moment of rupture.

I have hitherto spoken of friction only in reference to the packing of the apparatus. This friction, as I have already stated, varies with the pressure, but there is also the constant friction due to the weight of the moving parts to consider. If the machine be used exclusively for high strains in relation to its weight, this constant friction will be unimportant, but if a heavy machine be used for testing light chains, a considerable element of error will be introduced, unless a proportionate friction of the same constant character be added to the indicator. Still, however, it is better that very heavy machines should not be used for testing very light chains, unless they be constructed with more than one press, but separately for light chains and conjointly for heavy chains. With this view, the Birkenhead machine has three presses, the centre one being used alone for light strains, and the three acting in concert when great strains are to be exerted.

Although an hydraulic indicator, properly constructed and correctly adjusted in regard to its friction, may be safely relied upon as indicating with sufficient precision the strain exercised by the machine; yet, for the purpose of ascertaining in the first instance when correct adjustment has been attained, and also for detecting any discrepancy which may subsequently arise from dirt upon the ram or plunger, or from any other cause producing irregular friction, it is necessary that every machine should be provided with a lever indicator, to which the strain may be immediately applied, and the strain ascertained by the lifting of a weight. Such an apparatus requires to be accurately fitted with knife-edge bearings, in order to afford delicate indications, but, as these are liable to deterioration by too frequent use, it is better to reserve the lever apparatus as a standard of reference for adjusting the hydraulic indicator, which is not liable to deterioration by use. It is not necessary that the lever indicator should range as high as the hydraulic indicator, for the two indicators register alike through a sufficient range of the lower strains, no discrepancy would be manifested

if the comparison were carried to the highest powers of the machine.

I may here mention that nothing so soon deteriorates the lever apparatus as inadequate length of the knife-edges in relation to the strain upon them. The conclusion arrived at in the Elswick Works is, that not less than one-inch length of edge should be allowed to every five tons of strain upon the bearing.

In the arrangement of a public chain-testing establishment, it is desirable that the apparatus for the various operations should be placed in such succession as will allow the chains to move from process to process without any retrogression. The Birkenhead Chain-testing Establishment commences with a store room for the reception of unproved chains. From this store each chain is dragged by a steam-power capstan through an opening in the partition-wall on to the testing-bench of the machine. It is there made fast—at the one end to the press and at the other to the cross-head, supported on live rollers, which cross-head may either abut against a stop or be connected with the lever indicator. After the chain has been proved it is dragged by a second capstan directly forward in the same line into the examining-room, and there stretched upon one of the benches, where it undergoes a close inspection. If found perfect, it is then hauled forward by a third capstan through the heating oven and blocking trough, and is thence passed complete into the delivery store at the opposite end of the establishment. The course of the chain being thus in one straight line, it is necessary to carry it over the machinery at each end of the testing-bench, and to accomplish this a channel of wrought iron is fixed over the machinery to support the chain in its passage. Should the chain fail in the test, or be found defective on examination, it is drawn off by one of the capstans to the smiths' fires, placed on the floor of the examining-room, and after repair is again hauled to the testing-bench for a second proof. For the convenience of handling heavy chains at the smiths' fires a hydraulic crane is connected with each fire. Between the testing and examining rooms there is an intermediate room, called the Indicator-room, in which the lever and hydraulic indicators are placed, and the valves of the apparatus manipulated by an attendant in view of the indicators.

Anchorers are received into the same store-room as the chains, and the usual appliances are provided for fixing them in the test. Over-head cranes are employed for lifting the anchors, as well as for lifting the chains in the two stores.

There are two testing machines in the establishment, fixed at opposite sides of the room. These are similarly arranged in every respect, but one of them is adapted to test up to a strain of 200 tons and the other to 300 tons.

The hydraulic pressure is supplied from a neighbouring accumulator, used for a system of hydraulic machinery, at work in the adjacent dock.

As the general practice is to make chain cable in lengths of fifteen fathoms, the Birkenhead machines are adapted for that length. The Board of Trade have recently fixed upon that length as the limit of length of chain to be tested at one time. The propriety of their so doing has been called in question, but I may state that it is the opinion of those persons who have the management of the Birkenhead machines, that no advantage of any kind would be gained by testing chains in greater lengths. If there is to be a limit, it is clear that such limit is best fixed at the length at which chains are usually made. There is, besides, a positive objection to exceeding that limit, because a greater length than fifteen fathoms cannot be tested without the use of intermediate supports, which, whether they be slides or rollers, are objectionable as being liable to produce variations of strain in different parts of the chain.

Another objection to permitting indefinite lengths of chain to be tested at one time arises out of the stretch to which chains are subject in testing. This stretch occa-

sionally amounts to five feet in fifteen fathoms, and if that length of chain were greatly exceeded, it would involve a press of very inconvenient length, or necessitate taking repeated holds of the chain, which would be highly objectionable. I think, therefore, that the Board of Trade have acted wisely in imposing a limit, and in fixing that limit at fifteen fathoms.

ON A NEW METHOD OF MEASURING ELECTRICAL RESISTANCES, APPLIED BY MESSRS. SIEMENS.—By ROBERT SABINE AND LOUIS SCHWENDLER.

The following was read in Section A:—

The insulation of submarine telegraph cables was, until the Red Sea and Indian lines were submerged, in 1859, determined qualitatively by the simple deflection of a galvanometer needle. If the deflection obtained, when the further end of the cable was in air, was very small in comparison with that obtained when the end was to earth, the cable was pronounced good; no deflection indicated a very good cable; and a great deflection an indifferent one.

A most decided step in advance of this crude method was made by Messrs. Siemens. It consisted in regarding the insulator as a bad conductor whose resistance could be expressed in the same measure as that of the copper line; and Mr. Fleeming Jenkin, about the same time, appears to have made experiments with the same end in view.

The manufacture of the core of the Malta-Alexandria cable, with the scrupulous surveillance of its electrical conditions, forms an era in cable work. Messrs. Siemens, who were entrusted by the Government with the duties of electricians, may be said to have then first established with success the science of cable-testing.

The system of tests applied to the single lengths of the core at the gutta-percha works gave their resistances of insulation and conductor, at a uniform temperature of 24°C., in the same units of measure.

As the whole of the cable was tested daily also at the Sheathing Works at Greenwich, as it grew in the tanks, from one to some hundreds of knots in length, it was necessary that the system of measurement should be equally exact, and applicable to long as to short lengths.

When the length of a cable is great, or its insulation indifferent, the value of the latter may be ascertained by the same method as that used in measuring the copper resistance—that of Wheatstone's bridge. But when the insulation exceeds a million units, this method becomes no longer available, on account of the differences between the currents in the four sides. It is therefore necessary to have recourse to a method less limited. For this purpose the deflection of a magnet-needle is observed, when the measuring battery, cable, and galvanometer are alone in the circuit; the constant of sensibility of the instrument being ascertained by the substitution of a unit of resistance and of electro-motive force for the cable and the measuring battery.

With a delicate galvanometer—such as Dubois' sine or Thompson's reflecting instrument—and a sufficient battery power, this method is available for measuring the highest resistances which have to be determined in cable-work. It is found, however, to be less adapted to the determination of resistances of a value lower than four or five millions of units; to be inconvenient on board ship during the submersion of a cable; and to be always burthened with a certain amount of tedious calculation. It was therefore necessary to seek for another method which would combine the simplicity and accuracy of Wheatstone's bridge with a higher range. The method determined upon was a modification of the common differential galvanometer. The equality of the coils was abandoned, and the relation of their magnetic forces upon the needle system only ascertained as a constant of sensibility.

As early as 1860, one of us used, in cable measurements, at Greenwich, a differential galvanometer with two coils,

one of which exerted two thousand times more deflective force upon the needle than the other. The cable and the measuring battery were inserted in the circuit of the larger helix and a single element, with a set of resistance-coils in that of the less sensitive helix of the instrument. The resistance in the latter circuit was altered until the magnetic forces of the two currents upon the needle were equal and opposite, and the pointer rested over the zero line of the card. The manipulation was simple, and the necessary calculations reduced to the mere multiplication of the value of the resistance inserted in the smaller circuit with the constant of sensibility and the relation of the electro-motive forces.

This method was found to answer well, being quite as delicate as the bridge, as unlimited as the method of deflection, and, at the same time, having the advantage of being totally independent of the magnetism of the needles. It has, therefore, been used very generally by us in cable and other measurements since that time.

On the occasion of fitting out the Carthage cable expedition, it was considered desirable, in measurements of insulation on board ship, to dispense entirely with mathematical reductions, and to read off the resistances directly from the instrument.

It is easily understood that, to establish an equilibrium between the magnetic forces of the currents in the coils, it is not absolutely necessary to alter either of the currents; the same may be done equally well by altering the relative distances of the coils from the needle. This is the principle on which the new method forming the subject of this communication is based. The mechanical construction of the instrument is very simple; the magnetic needle system is suspended by a fibre of unspun silk between about 10,000 turns of a long, thin, well-insulated copper wire; its position being indicated by an aluminium pointer fixed across the same axis, moving over a dial-card, and observed through a magnifying glass.

Outside the case of the instrument is a horizontal metal stage, on which a vertical coil of copper wire is moved to and from the needle by means of a micrometer screw. This is the coil whose distance from the needle is varied, in order to make its deflecting power equal, at any moment, to that of the stationary coil. Its distance is observed with the aid of a scale engraved on the side of the metal stage which it travels over. The whole instrument stands upon a tripod with three adjusting screws. Its remaining mechanical arrangements differ slightly, in some points, from those of other instruments—greater facilities being given to the operator for centering the needle system and for levelling the instrument.

We will now give a sketch of the theory of the method and of its use in cable-testing.

Suppose two galvanic currents circulate in the two coils—the stationary and the moveable one—in opposite directions; they will oppose each other in their effects upon the needle, which will take up a position at an angle less than that which it would if the stronger coil were alone active. By altering the position of one of the coils a point is reached where the deflective force of one coil is made to exactly counterbalance the force of the other, or the needle returns to zero.

We will call the magnetic force of the stationary coil, with a unit of current upon the needle, m ; that of the movement coil, with an equal current, — n . Further, when the balance is established by unequal currents, let these currents be, s , in the stationary, and s' in the moveable coil.

Then the magnetic force of the current in the stationary coil will be

$$ms,$$

and that in the moveable coil

$$-ns',$$

which, together, neutralise each other, or the sum

$$ms - ns' = 0.$$

The relation $\frac{m}{n}$ of the magnetic force of the coil is

$$\frac{m}{n} = \frac{d}{s} = a$$

a being a constant of sensibility of the instrument for any one certain position of the moveable coil. The greater the distance of the latter from the needle system, the greater becomes the value of a ; because a is variable with the position of the moveable coil, decreasing, according to the theory of magnetic forces, as some function of the distances of the coil from the needle increases. Therefore, the value of a for any given distance, d , of the coil from the needle would be

$$a = m F(d)$$

As the function, F , however, is a very complicated one, where the distances are not very great in comparison with the lengths of coil and needle, it is necessary, in practice, to ascertain experimentally the value of a for every division of the scale.

Being thus in possession of the constant of sensibility for every position of the moveable coil, let us imagine not two separate circuits; one includes the stationary coil, a battery whose electro-motive force is E , and the resistance, z , of the cable insulator; the other circuit includes the moveable coil and an element where electro-motive force is e .

We have, then, in the cable circuit, the current, S ,

$$S = \frac{E}{z + r} \dots\dots\dots (1)$$

in which r is the resistance of the battery and instrument.

In the moveable coil the current is s'

$$s' = \frac{e}{r'} \dots\dots\dots (2)$$

r' being the instrument and battery resistance in this circuit.

The currents in the two coils, tending to deflect the needle system in opposite directions, if the distance of the moveable bobbin be altered sufficiently, the needle may be brought to zero, and we have the equation

$$\frac{s'}{S} = a \dots\dots\dots (3)$$

From (1), (2), and (3), the constant a is

$$a = \frac{e}{E} \cdot \frac{z + r}{r'}$$

and the resistance, z , of the cable insulator,

$$z = a \cdot \frac{E}{e} \cdot r' - r$$

Usually, r is very small in comparison with z ; it may, without appreciable error, be neglected, and the resistance of the cable be expressed by,

$$z = a \cdot \frac{E}{e} \cdot r'$$

With the aid of this formula a table is constructed, E and r' being constant quantities, and the value of a known for every division of the engraved scale.

To measure the resistance of a cable with this instrument, therefore, nothing more is necessary than to put it in circuit with the larger coil and its battery, E , and to vary the distance of the moveable coil until equilibrium is obtained. The distance is read off, and the table supplies the corresponding resistance in units.

VOLUNTEER FIRE BRIGADE.

The New York correspondent of the *Standard* gives the following:—Of late the city has been disgraced by firemen's fights, one or two of which have been of a de-

cidedly sanguinary character—one, indeed, rising to the proportion of a riot, and requiring in its suppression the charges and batons of some 300 policemen. Until within the last few weeks the checking of fires in the metropolis has depended entirely upon the efforts of volunteers, organised after a fashion, having their distinctive company names, and governed by a marshal elected by themselves. The five departments under this system became at last a gigantic political "machine;" its members were simply red-shirted ruffians (generally speaking), exercising complete terrorism at the polls in many of the election districts, and oftentimes completely bidding defiance to law and order. Their riots in the streets and at their "engine-houses," their robberies on the highway, and their general Thuggism, in time more than counterbalanced the undoubted gallantry and heroism they displayed at the numerous conflagrations with which our city has been visited, so that a paid fire department becomes absolutely necessary. The law authorising such an organisation was passed by the last legislature, and, after many ups and downs, the new force has been placed in action. The system just inaugurated has met with the open or covert opposition of hundreds of the volunteers, the worst class excited to such hostility by the ward and grog shop politicians, who saw that a paid department would put an end to their hopes of office. The rivalry existing between the various companies, always productive of evil, sprang at once into the shape of open battles. Thus, on the morning of Sunday, the 20th of August, a riot occurred in the Thirteenth Ward in this city, which at one time bade fair to equal the most sanguinary battles in our municipal history. The members of Engine Companies Six and Forty-one met by preconcert, and fell upon each other with great fury. Each fireman was armed with pistol or loaded club, or with both; and each company "blazed away" with revolvers at the other until the ammunition gave out, and then came to close quarters. Happily, under the circumstances, the belligerents were very poor marksmen, for but one man was killed outright, and two mortally wounded. The police of three precincts gathered and charged upon the combatants, and finally put them to flight. Both companies have been disbanded. As is usual in such cases, all the victims of the riot were spectators, none of the active participants being dangerously injured. On Friday evening last another battle, not so sanguinary, but for a time quite as determined, took place, the belligerents being members of Engine Companies Forty-six and Twenty-one. These street fights, fearful as they are, are not, however, the most significant proof of the utterly lawless character of our volunteer firemen. Their hostility to the new system is most startlingly betrayed in the extraordinary increase in incendiary fires noticed within the first six months of the year. During the half-year ending in June there were 82 fires of incendiary origin; and there were, in addition, 18 attempts at incendiarism. There were during this time 39 arrests on charges of arson, or attempts to commit that crime. Two of the persons arrested were convicted and sent to the state prison; seventeen were discharged by the grand jury or by police magistrates; six were indicted, and are now awaiting their trial; four were held to bail; two were discharged on their own recognizances; one was held as a witness; and seven stand committed pending an examination. By these known incendiary fires two persons have lost their lives. The people pray most devoutly for the complete establishment of the paid system, as, indeed, they have reason to do. But the malcontents of the old department mean to make all the mischief they can before they are driven out; and it is highly probable that the police will have heavy work to do before the last vestiges of the volunteer system are destroyed. It is a well known fact—and a powerful argument in favour of a paid system, adduced by the police commissioners in their examination by the legislative committee last winter—that in the great riot of 1863

many of the firemen bore an active part, in some instances whole companies going over to the mob, and acting the role of incendiaries. I doubt if in any other city save job-ridden New York it would have been possible for such a monster organisation of outlaws and desperadoes to exist, under sanction and protection of the law, and enjoying peculiar privileges and immunities.

Fine Arts.

PARIS EXHIBITION OF INDUSTRIAL ART.—This exhibition, which has already been mentioned in the *Journal*, has grown, by subsequent additions, to great importance, and it may now be said, without hesitation, to form the finest collection of industrial art, retrospective, contemporary, and prospective, that Paris has yet witnessed. As regards the retrospective portion, the arrival of new contributions can scarcely yet be said to have ceased. Nearly the whole of the building, with the exception of that occupied by the permanent Algerian and colonial collections of the Government, is now filled with the treasures of past ages, the products of the present time, the works of industrial designers, and the studies of the pupils of the public schools. The ceramic arts occupy a large proportion of the space allotted to the past, and the collection is not only exceedingly extensive but also very choice. In the first place, the Union Centrale exhibits its own collection of Chinese, Japanese, Indian, Persian, and European porcelain and *faïences*, including many rare specimens, with labels, bearing the date and place of production, with other particulars, useful to students and connoisseurs; there is a large collection of Saxon ware of the seventeenth century, and of old Sèvres china, including a complete set, which belonged to the naturalist Buffon, and which is decorated with the birds that figured in his works, and a large number of pieces forming part of the two fine sets belonging to Madame du Barry. The collection of the works of Bernard Palissy and of the old potters of Rouen, Marseilles, and other places, of Italian ware of the sixteenth century, of decorated, gilded, and prismatic ware of all countries and ages, with a few examples of the art of Flaxman, and the ingenuity of Weugwood, is perhaps the most extraordinary ever brought together under one roof; the specimens of large pieces of Rouen ware of the early, as well as of the grand epoch, and that of the decline of the art, could scarcely be surpassed; and the glass cases, containing the contributions of M.M. Rothschild, Baron Schwiter, Salin, and other well-known collectors, abound in dishes and other pieces of ware, intended for the ordinary purposes of life, which are now preserved in frames, and equal in market value to the pictures of the great masters. The collection of enamels of Italian and French origin, in the sober grisaille of Limoges, or glowing in all the colours of the rainbow, representing subjects historical, religious, artistic, or merely fanciful, is equal in importance, if not in amount, to that of the ceramic wares, and a comparison of the best specimens of these with the works of French artists of the present day shows, in spite of the taste and ability exhibited in the latter, how far the art-workmen of the present day are, in matters of this kind, behind those of past ages. The specimens of ancient glass from the earliest rude productions to the pure forms of a later period, the beautiful prismatic effects and curious twisted and complicated decorations of a still later epoch, are numerous and in some cases unique. There are some fine specimens of metal work in the exhibition, from the rude locks of the earliest time, to the elaborate hammered, pierced, chased, and engraved work of the sixteenth century, when the material seems to have made little difference as regards the amount of art bestowed by the workman, and when a morsel of iron was converted almost into a jewel by the cunning hand of the artist; the smith, locksmith, cutler, and armourer, vied with the gold-

smith and the jeweller, and all left behind them the impress of the artistic period in which they lived and laboured. The arms and armour in the exhibition are of superlative excellence, and this is not surprising when it is known that the Emperor, and many of the most noted amateurs, have contributed their choicest specimens. The Imperial collection alone includes more than five hundred articles. There are more than twenty complete sets of armour, illustrating various periods of Italian, German, Saxon, and other art, and including some very curious examples of the tilting armour used in Germany, with all its grotesque complications. The great value of the collection lies in the ornamentation, and the number and beauty of the decorated specimens are remarkable—cuirasses, helmets, shields, swords, daggers, halberds, battle-axes, maces, spurs, powder-flasks—exhibiting every variety of ornament, hammered, chased, engraved, pierced, inlaid, niello, and gilt-work of the various periods of Oriental, Italian, German, and French art, and so exhibited that every detail may be seen without an effort. The collection includes a vast number of fine bronze figures and ornaments, Greek, Roman, Gallo-Roman, French, Italian and German; series of gold coins of remarkable beauty, illustrative of ancient and modern engraving; curious old German silver ware of the seventeenth century; many of the choicest specimens of the enamels of Petitot and other artists on snuff-boxes, comfit-boxes, and other articles of the kind; beautiful examples of carved work, in ivory and wood, of all countries and periods; cabinets and articles of furniture, carved, inlaid, and decorated in every possible style, from the church and other furniture of the middle ages down to the rococo productions of the eighteenth century; tapestry, brocades, embroidery, lace, and other work of every country in the world, Asiatic as well as European. In fact, there is scarcely a single industrial art of any period, or of any country, which is not fairly represented in this remarkable exhibition. It is unfortunate that circumstances have not permitted the management to publish a catalogue of the whole collection, but the late arrival of many of the contributions evidently rendered this impossible to the present moment. Catalogues have appeared of the modern portion of the collection, and of the Imperial collection of arms, and others are promised shortly. The Exhibition is announced to remain open until the end of November.

EXHIBITION OF WORKS OF ART IN VENICE.—The Venetian Society for the Promotion of the Fine Arts announces the organisation of a permanent exhibition of works of art under its auspices. Foreign artists are admitted as exhibitors, but must bear the whole charge of transporting their works to and from Venice. They are to be addressed to the Presidenza della Società Veneta Promotrice di Belle Arti, Palazzo Mocenigo a. S. Benedetto, Anagrafico, No. 3,980. Each series of contributions will remain on view for two months.

EXHIBITION AT VERSAILLES.—The Annual Exhibition of the Society of the Friends of the Arts of the Seine-et-Oise, was to open on the 8th instant.

SCANDINAVIAN EXHIBITION.—The difficulty which occurred in consequence of the determination of Sweden and Denmark to hold exhibitions of Scandinavian industry in their respective capitals at the same period, has been met by the abandonment of the project, for the present, on the part of the authorities of the latter country. The Stockholm exhibition, therefore, now stands alone, and is fixed to open, as announced in the *Journal* some weeks since, on the 15th of June, 1866.

ART CONVENTION BETWEEN FRANCE AND NASSAU.—The *Moniteur* announces the promulgation of a convention recently agreed to between France and the Duchy of Nassau for the reciprocal protection of property of works of art of literature.

PUBLIC STATUES.—A double *fête* occurred the other day at Montbard, in the department of the Côte d'Or, when the supply of water to the town was inaugurated, and a statue of Buffon, the naturalist, erected some time

since in the same town, was consecrated; the engineer of the water works is a grand-nephew of the *accusé*, and both were born in the town where the ashes of the former repose. Discourses were delivered by the celebrated chemist, M. Chevreuil, director of the museums in the Jardins des Plantes; M. Decaise, president of the Academy of Sciences; M. Duméril, representative of the Imperial Acclimatization Society; and by the Maire of Montbard. Brussels has just erected and inaugurated a monument in honour of M. Verhaegen, the founder of the Free University in that city. M. Verhaegen died in 1862, having founded the Free University in 1834, and leaving, by will, to the municipality of Brussels the sum of forty thousand francs, for the encouragement of education.

ART EDUCATION IN FRANCE.—Although architecture has so many professors and students in France, and although so much attention has been given of late to domestic architecture in particular, there has not existed a preparatory school for instruction in the practical part of the art. The Academy and the New School of Fine Arts include architecture in their classes, and it holds a very eminent position in the course of studies, but the want of practical instruction has long been felt, and it is now being supplied. A central school of architecture has been set on foot, with the countenance of the government, under the patronage and with the subscriptions of the Prince Napoleon; M. Boitelle, Prefect of Police; MM. Michel Chevalier, Emile Péreire, E. Fould, Caffarelli, Viollet le Duc, Flachet, and other gentlemen. The school will be under the direction of M. Emile Trélat, Professor at the Conservatoire des Arts et Métiers, and aided by MM. Treasca, Burat, Muller, de Mastang, and other professors. The studies will embrace all the elements of the art and science of architecture, and the course will occupy three years, when the pupils, it is hoped, will be better prepared than they are at present for availing themselves of the advantages of the School of Fine Arts, and more independent of the teaching of the workshop as regards knowledge of the materials employed in their profession and methods of construction.

Manufactures.

THE SILK-WORM.—The following account is taken from the report of Mr. Meadows, H.B.M. Consul at the port of Newchwang:—

"In a journey to the Korean borders during the autumn of 1863, I found myself, so soon as I had crossed the watershed of the Leason mountains, travelling through a silk-producing country. I had, indeed, heard before of silk being produced at and near Fung-hwang city, but had considered it merely an amateur domestic occupation, not capable of being developed into a trade. That it is much more than this, and that it may furnish in time what the port greatly wants, an article of export to Europe, I have now no doubt. Questions have been raised as to the nature and characteristics of the silk-worm peculiar to this district, but only a personal visit to the silk-producing country for the express purpose of getting information could enable me to give answers to them of which I myself could place full reliance. It is difficult enough to extract good information from Chinese who, in the midst of the things inquired of; at a distance it is next to impossible. As an instance of this, I may say that in spite of all my frequent inquiries, made both when in the silk-producing district and at this port from native of that district, it is only within the last few months that I have learnt of another tree besides the oak on which the large worm feeds. The oak-bush is called locally *Pai ko tsai*. The other bush is called *Chien tao tsai*. Its leaves are narrow and long, as compared with those of the oak-bush. Its bark is of a greenish white hue, and is smooth and its trunk and branches straight and ungnarled as compared with those of the oak. It produces a seed &

nit on which pigs feed. It must, I think, be a species of beech. The silk produced by worms fed exclusively on this bush are said to be stronger than when they are fed on the oak. It is, I fear, beyond doubt that the oak-leaf-eating worm, the *shan keen* or mountain worm, as the Chinese here call it, is of a different species from the mulberry-leaf-eater, which is here called the *kaa keen* or domestic worm; and that, therefore, the hope of a beneficial crossing cannot be indulged in. On the other hand, the mulberry-leaf-eater or domestic worm of the Newchwang insular district does seem to be of the same species as that of middle China; and it might be desirable to try the effects of a crossing with an animal that has probably in many generations been a separate inhabitant of this widely different climate. As the cocoon produced by the mountain worm is about three times the size of that produced by the domestic worm, so the worm itself is about twice the thickness, though little if anything longer. It is of a brown or dry-earth colour, and has on its back little knobs or protuberances. In its flying stage the 'mountain' insect is a large and richly-coloured butterfly, measuring from tip to tip of its expanded wings some seven to nine inches, 'as large as a swallow.' A native of the silk country now here professes to have once fed a few mountain worms on mulberry leaves. They ate as much as five or six times the number of domestic worms, and the cocoons they spun did not at all differ in their appearance from those spun by mountain worms fed on oak-bushes. The same man tells me that the stuff made from the cocoon of the mountain worm will take only a black or a purple dye, and that those who desire to make with it a tuff of other colour are obliged to use some proportion of cotton threads. Looking to the three great classes of textiles, cotton, wool, and silk, the produce of the mountain worm must be classed with the latter, inasmuch as it neither grows on a shrub nor on an animal's back, but is produced by a leaf-eating worm, and, viewed as 'silk,' is manifestly of an inferior quality. But if we choose to look at it simply as a new textile, there is some reason to believe that it may prove to have useful qualities not possessed by either silk, wool, or cotton. Should it be found to possess some such peculiar quality so useful as to make it specially marketable, then it will become a matter of interest to ascertain whether a cocoon-forming worm which exists in a wild state in British North America—near the Canadian lakes, I think—is not the same animal as the Newchwang 'mountain' worm. The climate of the two regions is essentially the same, and if the cultivation should seem desirable in Canada, the difficulty of want of experience as well as want of sufficient labourers might be got over by introducing Chinese emigrants from the Newchwang silk-districts. Be that as it may, the produce of the mountain worm spun into thread or as cocoons should, if the provincial authorities are not allowed to interpose barriers to foreign adventure, prove a fairly remunerative export from this port town, and that for the reason stated in the accompanying memorandum; it has for generations back paid Chinese dealers to send it seaward in junk.

ACCIDENTS FROM STEAM MACHINERY.—In consequence of the removal of certain restrictions respecting the employment of steam power in manufacture, the *Moniteur* has collected and published an account of the accidents which happened through the use of steam during the past year. It appears that the accidents were only sixteen in number, but that the number of persons who were killed, or died afterwards of the injuries inflicted, amounted to forty, and that fifteen other persons were wounded more or less seriously. Of the sixteen accidents, four occurred in sugar works, three in paper manufactories, two each in distillery and drug works, and one each in other industries. The causes of accident are classified as follows:—Eight occurred by the explosion of cylindrical boilers; three by that of tubular boilers with interior furnaces; one by the explosion of a locomotive; and four by that of steam-heating apparatus. The im-

mediate causes are supposed in eight cases to have been the bad quality of the metal employed or the vicious arrangement of the furnaces; in seven others, carelessness or want of superintendence on the part of engineers or stokers; and in the remaining case from the imprudence of other persons. The *Moniteur* gives the details in each case, in order that manufacturers may take warning for the future. This return of course does not include railway or other accidents which occurred in connection with, but were not immediately caused by, steam machinery.

Commerce.

HOPS IN FRANCE.—It appears from official returns that the cultivation of hops in France has increased considerably of late years. The hops planted in the department of the Bas Rhin in 1857 covered a superficies of 574 hectares (2½ acres each), and there have been 120 additional hectares planted within the last eight years. M. Heuzé, in a communication to the Imperial Agricultural Society, attributes this increase in the culture of hops to the improvement in agriculture. It must be observed, at the same time, that the quantity of hops imported is increasing every year. In 1845 there were only 721,000 kilogrammes imported, while in 1855 there were 1,556,000 kilogrammes. The landowners in the Bas Rhin are at present making every exertion to supply a sufficient quantity for home consumption, and to enable the country to be independent of foreigners for a supply. It is said that French brewers, for a great number of years, were accustomed to make beer without hops. They substituted for the hop plant coriander seed, wormwood, and the bark of box-wood, but the bad quality of the beer thus produced disgusted their customers, and they compelled brewers to use hops, as the only substance which can produce a wholesome beverage. It is stated that every inhabitant in France consumed, on an average, in the year 1825, nine quarts of beer. The consumption increased in the year 1837 to nearly twenty litres, and since then it has progressively increased.

THE TOBACCO TRADE AT NEW ORLEANS.—In 1863-4 the supplies of tobacco here were too trifling to establish a regular market, and there has been but little improvement since. The stock has varied from 594 hogsheds in September, 1864, to 1,031 in December last, and 873 recently. In comparing the year's business with 1863-4, it appears that the total supply has consisted of 3,004 hogsheds, embracing 594 hogsheds on hand at the commencement of the year and 2,410 received since, against a supply of 1,638 hogsheds last year. The exports have comprised 1,831 hogsheds against 797. The reported sales have been confined to 300 hogsheds against 514. Prices have exhibited a wide range.

Colonies.

LABOUR IN THE VICTORIA GOLD FIELDS.—Since the commencement of the present year, the number of miners has gradually increased. In 1862, an average number of 97,942 miners was employed, producing an aggregate of 1,702,460 ounces of gold, equal to an average of £1 9s. 6d. weekly for each miner. In 1863, the miners numbered 92,292, producing 1,578,079 ounces, making the average weekly earnings £1 6s. 3d. each. In 1864, there were 83,394 miners, and the produce 1,557,397 ounces, equal to £1 8s. 9d. as the average earnings of each miner weekly. From January to the end of June, 1865, the number of miners was 85,022, who produced 656,436 ounces, making an average of £1 7s. 4d. each per week. In the first six months of last year, the numbers were 83,175 miners, resulting in 759,461 ounces of gold, or an average of £1 8s. 1d. per week for each miner.

THE VINTAGE IN VICTORIA.—The Victorian vintage is year by year becoming of more importance to the colony. There are flourishing and increasing settlements in the neighbourhood of Geelong, Castlemaine, and Sandhurst, as well as about Melbourne, devoted to the cultivation of the vine. Recently published statistics show that the total number of vines in the colony is now 8,150,000, of which 1,125,000 were planted in the preceding 12 months. The yield of wine from the vintage of 1865 will be short in quantity—in proportion to the increased area planted—but superior in quality. The deficiency is mainly attributable to the cold southerly gales and hailstorms that prevailed during the flowering season, by which every vineyard suffered severely. From the Yering and Tabilik districts the returns are most satisfactory; at the former, where 30 acres of vines are now in bearing, about 16,000 gallons of wine have been obtained, and at the latter place, where 150 acres are coming into bearing, the yield has been about 22,000 gallons. It is estimated that the total yield of the colony will not fall short of that of last year, which was 105,000 gallons of wine.

AGRICULTURAL AND PASTORAL LAND IN VICTORIA.—A return lately presented to the Legislative Council shows that in the year ending 31st March, 1864, the extent of land occupied by the squatters amounted to 81,683,366, or considerably more than half the area of the colony, whilst the average occupied by farmers was only 2,697,981—an insignificant extent when compared with the area devoted to pastoral purposes. The number of persons employed in agricultural pursuits at the time of the last census was 41,218, of whom 6,480 were females, whilst the persons engaged in pastoral pursuits were only 9,724, of whom 644 were females. The same return shows that in 1863-4 the value of the pastoral produce was estimated at £3,316,793, whilst the value of the agricultural produce was estimated at £3,676,250.

PROGRESS IN VICTORIA.—A permanent Fine Art Gallery has been formed in Melbourne, and the promoters propose to keep the place open constantly for the exhibition (expressly for sale) of pictures by colonial artists. Government are about to expend £3,500 in the erection of a post-office, savings-bank, telegraph-office, and Mechanics' Institute for the Collingwood district. The Building Society movement is in great favour in this colony just now. Several new associations have been established lately, and with every prospect of success. An Acclimatization Society has been formed in Gippsland, as a branch of the present Society in Melbourne.

Obituary.

FRANÇOIS JOSEPH HEIM, French historical painter, and member of the Academy of Fine Arts for nearly forty years. He was born at Belfort, in the year 1787, took the great prize of the Academy when twenty years of age, and obtained one of the grand medals of honour at the Universal Exhibition in Paris in 1855. He is represented in the Luxembourg gallery by a picture of the "Massacre of the Jews;" at the Louvre by two ceilings; and he executed several large works in Notre Dame and other churches of Paris. He produced a large number of works exhibiting great knowledge and power of composition, and a fine eye for colour; but he will be best remembered by his drawings, which are full of vigour and originality.

ADMIRAL W. H. SMYTH.—On Saturday, the 9th September, at his residence, St. John's Lodge, near Aylesbury, passed away from us one whose name will ever be held in high honour in the annals of British science, and whose loss will be deeply felt by a large circle of attached and admiring friends. Although for several years past living in comparative retirement, yet devoted without ceasing, to within a few days of his death, to literary and scientific labours, Admiral William Smyth was at one time an active and prominent member of the scientific life of the metropolis. As president of the Astronomical Society,

founder, and subsequently president, of the Geographical Society, vice-president, foreign secretary, and for many years member of the council of the Royal Society, director of the society of Antiquaries, visitor of Greenwich Observatory, one of the founders of the United Service Institution, in these and many similar capacities his untiring energy, extensive and varied acquirements, sterling integrity and honour, and his genial, social qualities exercised a great influence for good through the important circle in which he moved. He was born at Westminster, on the 21st of January, 1788, entered the navy at an early age, and served with considerable distinction in nearly all parts of the world, during the war which terminated in 1815. With a strong natural inclination for scientific pursuits, and an aptitude for work rarely equalled, he employed the following ten years in making those surveys of the less known parts of the bed and coasts of the Mediterranean which will ever associate his name with the history of that sea. Retiring in 1825 from marine service, he entered upon another phase in his scientific career, and commenced in his observatory at Bedford that laborious and accurate series of astronomical observations which resulted in the publication of the "Cycle of Celestial Objects," including the "Bedford Catalogue," a work universally acknowledged as one of the best handbooks of practical astronomy extant. Besides hydrography and astronomy, the admiral was an ardent cultivator of some branches of archaeology, more especially numismatics; but a list of some of the more important of his numerous works will best give an idea of the extent and variety of his researches—"A Descriptive Memoir of the Island of Sicily," 1824; "Sketch of the Present State of the Island of Sardinia," 1823; "Descriptive Catalogue of a Cabinet of Roman Imperial large Brass Medals," 1834; "A Cycle of Celestial Objects," 2 vols., 1844; "Ædes Hartwellianæ, or Notices of the Manor and Mansion of Hartwell," 1851; "The Mediterranean, a Memoir, Physical, Historical, and Nautical," 1854; "Descriptive Catalogue of a Cabinet of Roman Family Coins," 1856; "Speculum Hartwellianum," 1860; "Addenda to the Ædes Hartwellianæ," 1864; "Sideræ Chromatica," 1864. Admiral Smyth married at Messina, in 1815, the only daughter of Mr. I. Warrington, of Naples, a lady of great accomplishments and who has been the constant and devoted companion of all his scientific labours.

Publications Issued.

ELECTRICAL COMMUNICATION IN RAILWAY TRAINS. By Andrew G. Brae. (*Effingham Wilson*, Royal Exchange).—The writer takes into consideration the causes which have hitherto prevented the successful application of this principle, reviews various attempts made, gives a list of several patents which have been taken out for the purpose and then describes an invention of his own for effecting the object.

A DICTIONARY OF CHEMISTRY. Edited by Henry A. Watts, B.A., F.C.S. (*Longman and Co.*, London).—Part XXXI. of this work is just published, containing articles on Phenol and Phenylmalines.

POPULAR SCIENCE REVIEW. Edited by Henry Lazenby, M.D. (*Robert Hardwicke*).—The October number of this periodical, which is a quarterly miscellany of entertaining and instructive articles on scientific subjects, comprises the 4th volume, which contains the following articles:—Atlantic Telegraphy, by Robert Hunt, F.R.S.; On Pure Water, by Edwin Lankester, M.D., F.R.S.; On the Nature and Diagnostic Value of Raphides and other Plant-Crystals, by George Gulliver, F.R.C.S., F.R.S. &c.; On Lake Basins, by Professor D. T. Ansted, M.A., F.R.S.; Epidemics, Past and Present—Their Origin and Distribution; On the Microscopic Anatomy of an Insect Larva—Corethra Plumicornis, by E. Ray Lankester; The Moon, by James Breen, F.R.A.S.; Photographs of some of its Applications, by the Editor.

Notes.

CHAMP RAILWAY TRIPS IN FRANCE.—Visitors to Paris this year have the opportunity of visiting other parts of France at very moderate rates. An excursion to Strasbourg, enabling visitors to pass three days in that interesting town, took place the other day, the charge being 25fr. by the second, and 20fr. by the third class carriages, there and back. Another excursion train carries visitors to Havre and back for 12fr. and 9fr. respectively.

COTTON AND LINEN TISSUES.—The *Builder* states that Professor Boettger has discovered the means, by the aid of chemistry, of recognising the presence of cotton in linen fabrics. He takes a piece of the suspected cloth, about two inches by three-quarters of an inch, and, after having unravelled both weft and warp, plunges it in an alcoholic solution of aniline and fuchsine. The superfluous colouring matter is removed by washing the piece of cloth thus dyed several times in water. If, while it is still wet, it be placed in a saucer containing ammonia, the cotton fibres will immediately become discoloured, while those of linen will preserve a fine red colour.

CHOLERA PRECAUTIONS.—The head physician of the Paris and Strasbourg Railway Company has posted special instructions in all the stations on that line as to the precautions to be adopted in cases of an attack of diarrhoea. The company has, moreover, distributed among their *employés* boxes containing the medicine required at the first appearance of cholera, so that travellers and *employés* may find such remedies close at hand as are frequently sufficient to arrest the progress of the disease.

SPECIAL EDUCATION IN FRANCE.—The establishment of a normal school of technical instruction, projected by M. Duruy, the Minister of Public Instruction in France, and mentioned in the *Journal* of the 8th of September, has been decreed, and the necessary steps taken to carry the plan into effect. In his report to the Emperor, the minister says that it is not enough that the manufacturers of France are supplied by the Ecole Polytechnique and the Ecole Centrale des Arts et Manufactures with managers and artisans of ability; they require also a good supply of foremen, whose hands have been exercised by practice, and whose intellects are also in some measure cultivated by study. To supply this want is the object of the new institution. It is necessary, says M. Duruy, in order not to interfere with the manual portion of the artisans' education, that the system of technical instruction should be so flexible that it may be bent to fit the various circumstances of the locality and the wants of the population, whether agricultural or manufacturing. Any uniform programme would therefore be unfit for the purposes in view, and it has been determined to appoint a special council, whose duty it will be to introduce such improvements into the system of each great special school as they may deem necessary, in order to maintain a due proportion between the scholastic duties of the pupils and the other elements of their training, or, in other words, to take care that the student does not obliterate the apprenticeship. These councils will be under a superior council of improvement, which will, moreover, be entrusted with the surveillance of the new Normal School of Cluny. This superior council will take cognizance of all documents likely to affect the subject, whether furnished by professors of schools, inspectors, or by those entrusted with missions abroad, and will decide on the measures to be proposed for adoption, by the minister, to the Emperor or the Imperial Council of Public Instruction. The Minister of Public Instruction is appointed president of this new council, and M. Dumas, of the *Institut*, vice-president. As regards the new establishment at Cluny, the minister has visited the old abbey in which it is to be placed, and finding that the buildings are sufficiently extensive to accommodate two establishments, it has been determined to create a special college side by side with a special normal school, in order that the pupil teachers

may have the opportunity of immediately putting into practice the lessons which they have received from the professors of the superior establishment. The Abbey of Cluny will therefore be at once a normal and common school for the theory and practice of special instruction.

NEW METHOD OF FERTILIZING SOIL.—Two gentlemen, members of the Agricultural Academy attached to the University of Bonn, M. Nauenbrück and Dr. Hardstein, have conceived a new method of assisting the formation of humus, and which, it is said, has been put into successful practice at Annaberg, near Bonn. The method is the introduction of air beneath the surface of the soil; a system of pipes, like those used for drainage, but pierced full of small holes, are laid at depths of from three to six feet beneath the surface of the ground, is placed in connection with a furnace, which keeps up a continual draft through the pipes, and thus the subsoil becomes so impregnated with air, that when the connection with the atmosphere is closed, the fire continues to burn in consequence of the superabundant oxygen which is conveyed to it by the pipes.

Correspondence.

SUBURBAN RAILWAY TRAFFIC.—SIR,—The tardiness of our suburban railways is fast becoming a public grievance, one great cause of it being the time consumed in taking up and setting down passengers at the frequent stations; if a more expeditious mode of doing this could be discovered, railways near the metropolis might yet fulfil the hopes that have been formed of them. I believe I have discovered this "more expeditious mode," which I will describe as briefly as possible. I may premise that specially-constructed carriages would be required, and the addition of sidings to the stations which have not got them already; but this is merely a financial question. The plan is to have a passage through all the carriages, so that the train would communicate from end to end, and at the rear to have a setting-down carriage, so that the passengers who may wish to get out at any particular station have only to seat themselves in the last carriage, which the guard uncouples, and stops by application of break power. Thus far my plan is simple enough, and not by any means original. The real difficulty, however, is the taking up passengers when the train is on the move, and this I propose should be done as follows:—A carriage similar to the one cast off by the train should be in waiting in a siding, with the passengers in it, and this carriage the passing train would hitch on and draw after itself. Here, however, are two practical difficulties; one is to make the passing train catch up the end of the rope belonging to the waiting carriage.—but this problem any mechanic would readily solve, so, instead of taking up space to describe my own contrivance, I will pass to the next difficulty, which is to get rid of, or diminish, the shock of starting to the passengers in the carriage. Of course, if this cannot be done, the whole plan falls to the ground; but I think it can be effected in this way: The rope by which the carriage is drawn to the train should be wound round a drum containing a strong spring, so by this means the strain would be gradually applied. The strength of the spring would have to be proportioned to the force requisite to move the carriage—I suppose about double—so that when the rope would be half drawn out the carriage would begin to move, the speed of course rapidly increasing until it nearly equalled that of the train. The action of the spring could then be suspended by means of a break applied to the drum, and the newly-attached carriage would then attain a speed equal to that of the train, although at a considerable distance from it. There are various ways in which the carriage might be made to catch up the train, either by checking the speed of the engine at this point, or by manual labour in the carriage, or by both. When the carriage is coupled to the train, the new passengers would go to the body of the train,

and those wishing to be set down at the next station would take their places in the rear carriage, which would then be cast off and another taken, and so on at every station. The practicability of this scheme would, I think, be determined by the answers to these two questions:—First, what is the maximum of speed at which the operation of hitching on would be possible? Secondly, what is the minimum of speed which would effect a saving of time considerable enough to make it worth while to adopt this plan? Now if the maximum in the one case equals or exceeds the minimum in the other, the scheme may be considered worthy of adoption. For my own part I can see no reason why the operation described should not be possible at a speed of from six to ten miles an hour—perhaps more; while, on the other hand, it appears to me that if it were possible at any speed—if only at two miles an hour, or even less, provided the train did not actually stop—the plan would be advantageous. I do not propose this system for general adoption, but only for a few miles out of London, where, in fact, the passenger-traffic on some lines, under the present plan, has almost grown unmanageable. Beyond that distance passengers could change into ordinary trains. With this slight sketch of my scheme, I leave it to the judgment of those of your readers who are conversant with the subject. For my own part I can only say that if it be impracticable, I should be glad to be convinced of this as quickly as possible.—I am, &c., JAMES RIGBY SMITH.

Announcements by the Council.

INSTITUTIONS.

The following Institution has been received into Union since the last announcement:—

Gomersal (near Leeds), Mechanics' Institution.

NOTICE TO MEMBERS.

The One-Hundred-and-Twelfth Session of the Society, will commence on Wednesday, the 15th November, when the Opening Address will be delivered by WM. HAWES, Esq., F.G.S., Chairman of the Council.

The following are the dates of the Wednesday evening meetings, the chair being taken at Eight o'clock:—

1865. November	—	—	15	22	29
„ December	6	13	20	—	—
1866. January	—	—	17	24	31
„ February	7	14	21	28	—
„ March	7	14	21	—	—
„ April	4	11	18	25	—
„ May	2	9	16	23	30
„ June	—	—	—	27*	—

For the Meetings previous to Christmas, the following arrangements have been made:—

NOVEMBER 15.—*Chairman's Opening Address.*

NOVEMBER 22.—“On Water Supply, especially in Rural Parishes and Districts.” By J. BAILEY DENTON, Esq.

NOVEMBER 29.—“On the Proposed Purchase of Railways by the Government.” By WILLIAM HAWES, Esq., F.G.S.

DECEMBER 6.—“On London Milk.” By J. CHALMERS MORTON, Esq.

DECEMBER 13.—“On the Graphotype, a Process for producing from Drawings, Blocks for Surface Printing.” By HENRY FITZ-COOK, Esq.

DECEMBER 20.—“On Parkesine, its Composition, Manufacture, and Uses.” By OWEN ROWLAND, Esq.

— The Cantor Lectures for the ensuing Session

* The Annual General Meeting: the Chair will be taken at Four o'clock. No Visitors are admitted to this Meeting.

will consist of Three Courses, to be delivered by G. W. HASTINGS, Esq., LL.D., Barrister-at-law; FLEEMING JENKIN, Esq., F.R.S.; and Dr. F. CRACE CALVERT, F.R.S.

The following are the particulars of Mr. Hastings's course:—

LECTURE I.—MONDAY, NOVEMBER 27TH.—“The Effects of the Discovery of the Precious Metals on the Ancient Civilisation of the Mediterranean.”

LECTURE II.—MONDAY, DECEMBER 4TH.—“The Effects of the Discovery of the Precious Metals on Modern Civilisation.”

LECTURE III.—MONDAY, DECEMBER 11TH.—“On Copyright.”

LECTURE IV.—MONDAY, DECEMBER 18TH.—“On Limited Liability.”

The chair will be taken each evening at Eight o'clock.

These Lectures are open to Members, each of whom has the privilege of introducing one Friend to each Lecture.

Proceedings of the Society.

CANTOR LECTURES.

“ON SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS.” By Dr. F. CRACE CALVERT, F.R.S., F.C.S.

LECTURE IV.

DELIVERED ON TUESDAY, THE 25TH OF APRIL, 1865.

On some of the Discoveries in Agricultural Chemistry.

I shall in this lecture follow the same plan as I observed in my last (No. 3), taking a general view of the subject under consideration, and introducing as I proceed some of the most important discoveries which have been published of late on each particular subject. By adopting this plan I shall, on the one hand, avoid publishing a mere review of the results obtained, and on the other, I shall be enabled to give a general outline of the views entertained by most chemists of the present day on the subject of Agricultural Chemistry. You will also be better prepared to appreciate the value of the important discoveries made by our own countrymen, who, I am happy to say, are not sur-

passed in that branch of applied chemistry by any other class of chemists existing on the Continent.

The largest number of organic substances are composed of only three elements or simple bodies, viz., carbon, hydrogen, and oxygen, and even in many the latter substance is absent—for example, in many essential oils and the products resulting from the destructive distillation of organic substances, whilst those which contain oxygen are chiefly represented by starches, gums, resins, organic acids, and fixed oils; another class, such as morphine, quinine, and indigo, contain nitrogen, in addition to the substances mentioned. There is another class of substances, limited in number, which contain sulphur and phosphorus besides the four elements above cited; these are represented by albumen, corresponding to the white of an egg, or the serum of blood in animals; fibrine, represented in animals by the clot of blood; caseine, characterised in animals by the curd of milk. Therefore the whole of the organic matter of the vegetable kingdom is represented by the uniting together in various portions (influenced by particular molecular arrangements) of six elements, viz., carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus.

Although organic matters are composed of two or more of these elementary substances, they are never found in vegetable matters in their pure and isolated condition. They are always combined with a certain quantity of mineral matters which appear essential to the healthy condition of plants, and are, so far as we know, essential to the formation of the organic bodies themselves. Thus chemists have ascertained that plants generally contain lime, potash, soda, magnesia, oxide of iron, sulphuric acid, phosphoric acid, &c.

Let us examine the principal sources from which plants derive the elements essential to their formation, growth, or healthy progress. The most important element of all vegetable substances, and which, in fact, characterises all organic matter, is carbon, or what is commonly called charcoal. This element is derived entirely in vegetables from a colourless, invisible, and slightly acid gas, having a specific gravity of 1.52, and also sparingly soluble in water—I mean carbonic acid. You will easily conceive, on reflection, what an enormous proportion of carbonic acid must be produced annually, when you consider the vast amount of vegetation which surrounds us, produced either by the hand of man, under the influence of the plough, and other instruments, or by the rapid growth of trees and other vegetation which covers our hills and mountains. In truth the Divine Being has provided for an abundant supply, for there exist many sources of production of this gas so necessary to vegetation. It is useless to record here the well-known modes of producing this gas by respiration and combustion, but I wish to call your attention to some more special sources of its production with which you may not be so perfectly acquainted. M. F. Kulhmann, a well-known chemist, published in 1861 and 1862 a most interesting series of papers on the production of carbonic acid through the oxidation and reduction of the oxides of iron by their contact with organic matter. Thus he found that, if he took a clod of earth, the bulk of the iron existing on its surface was in a state of peroxide, mixed with a small quantity of protoxide, whilst towards the interior of the soil the reverse was observed. M. Kulhmann thus found that the oxygen of the oxide of iron was conveyed to the organic matter to convert it into carbonic acid. He further made the remark that sulphate of lime was, as M. Chevreul had already observed, a powerful oxidising agent, or served as a conveyor of the oxygen of the atmosphere to the organic matter existing in soils, the sulphate of lime becoming converted into sulphuret of calcium. These results explain certain facts observed by two learned chemists, MM. Boussingault and Loewig, who found that there existed large quantities of carbonic acid in cultivated soils, and especially in those that were highly manured, and that the production of this gas was continuous and most

abundant. The following table, taken from their researches will satisfy you, I hope, of the correctness of the above assertion:—

CARBONIC ACID.

Air	0.4
Recently manured soil	54.6
" " "	235.3
Vineyard	282.4
Forest loam	70.6
Forest land	83.2
Soil rich in manure	420.6
Meadow	161.8

Another source of the production of carbonic acid gas is one lately pointed out by a gentleman whom I cited last year with great, but not exaggerated praise, as a successful demonstrator of the untruth of the theory of spontaneous generation. M. Pasteur has demonstrated that wherever there is decay there is life—that, in fact, the rapid decay of organic matter depends in a great measure on the existence and maintenance of microscopic beings, and, as I stated in my last year's lecture, death is life. For M. Pasteur has shown that in all decaying matter exposed to the atmosphere, there exist mycodermes which carry the oxygen of the atmosphere to the organic matter, converting its carbon into carbonic acid, its hydrogen into water, its sulphur into sulphuric acid, its phosphorus into phosphoric acid. As to its nitrogen, other chemical actions come into play. There is still another source of production of carbonic acid, which I cannot pass by in silence, though at the present day its activity is decreased by the better cultivation of land, its influence must have been very great when men were less numerous on the surface of our planet, and no doubt, even now, that source of production of carbonic acid plays a great part in the vegetation of wild forests such as those of Northern and Southern America. Dr. Lyon Playfair, Mr. J. A. Boscawen, and M. Morin, proved some years since that certain small vegetable substances, known under the names of conifers, and algae, had the property, under the influence of light, of decomposing carbonic acid; while, on the contrary, in diffused light or darkness they yield carbonic acid. Strange it is to think that often some of the trees of these wild forests carry on their surface or their bark the vegetables which are to destroy them by absorbing their sap, and to feed them by liberating the carbonic acid essential to their growth. As to the conifers, which exist in marshy lands, pools, and other stagnant waters, they disappear by the hand of man as he drains the land and improves it for agricultural purposes. Notwithstanding the abundant sources of the production of carbonic acid, the atmosphere appears to contain but a minute quantity, viz., four parts in 10,000. This fact may be regarded as owing, first, to a law discovered by Dalton of the extraordinary property which gases have of being diffused and mingling together; secondly, to the immensity of the atmosphere as compared even with the abundant sources of carbonic acid; thirdly, to its removal by constant vegetation, either on land or in the ocean; fourthly, that a great portion of the carbonic acid which is produced in the interior of soils is absorbed by the sponges of plants. Liebig calculated, some years since, that if our sources of production of carbonic acid were to cease, and the present state of vegetation on the surface of our planet still continued, there was a sufficient amount of carbonic acid in the atmosphere to maintain it in full activity for a great number of years. As to the decomposition of carbonic acid by the leaves of plants under the influence of the chemical rays of light—scientific points which have engaged the attention of many chemists, among whom I may cite Boussingault, Dr. Gladstone, Grinwenden, and others, it is unnecessary that I should do more than state that the carbon of the carbonic acid is retained by the plant and contributes to produce the organic matter which form the frame of it, whilst the oxygen is liberated in a pure state to contribute again to the reproduction of

From these practical results, and many others which will be found in the papers published by Mr. Lawes, F.R.S., and Dr. Gilbert, F.R.S., in the *Journal of the Agricultural Society of England*, 1863-4, it is evident that in this case, as in many others I could cite, extreme views always bring a medium result which time generally confirms as the correct one.

I shall have to refer more minutely to these theories as I proceed with my lecture. Let me, meanwhile, call your attention to several chemical reactions which tend to modify organic matter, and render it fit to penetrate into plants, so as to enable them to yield the nitrogen so essential to vegetation. If the conversion of nitrogen into nitric acid, under the influence of certain mineral substances, has been known by its results for a long period in what is called the nitrification in the walls of our dwellings, still the demonstration of the conversion of ammonia into nitric acid is the result of comparatively recent researches. Even at the present day on the Continent it is believed (except by scientific men) that the moon has a great influence on the production of nitre in the walls of dwellings. Now, it is not the moon which has that power, but the sun, and as both move in the same direction the influence of one must be affected by the other, for as we know from the researches of Bunsen and others, as stated in my first lecture, that the intensity of chemical rays is in ratio with the intensity of light, it follows that it is the chemical rays of the sun which affect the conversion, and not the rays of the moon. At all events it is easy to conceive how ammonia can be converted into nitric acid in the walls of our dwellings. For sulphate of lime has the power of condensing ammonia, and no doubt, as demonstrated by Kulmann, of yielding its oxygen, thus converting its hydrogen into water, and its nitrogen into nitric acid, which in its turn destroys the sulphuret of calcium, giving birth to nitrate of lime. We all know that formerly, not only the rubbish from our dwellings was used as a means of obtaining the nitre which was required to manufacture the gunpowder used at that period, but that artificial nitre beds were prepared so as to yield the nitrate of potash required for war purposes. Even until recently, in Switzerland and Norway, the peasantry were subjected to a tax of supplying the government every year with a certain weight of nitre which those governments required for the preparation of gunpowder. Many researches have been undertaken to try and throw light on the chemical changes which take place in the conversion of the nitrogenated organic matter existing in such bodies into nitrates. The most interesting series of researches published on this subject are those due to M. Millon, which you will find in the *Comptes Rendus de l'Académie des Sciences*, 1864, in which he has shown that the production of nitre is in ratio with the quantity of vegetable matter, especially humic acid, that a soil contains, and that the most favourable land for the production of nitre is that which is called mould by gardeners. He further ascertained that if he made a mixture composed of ordinary earth, 20 parts, ashes, 4, mould, 3, the production of nitre was most active, and also that the oxygen of the air had a great influence on its production, converting the ammonia resulting from the decay of the organic matter into nitric acid.

These facts are well illustrated in the following table quoted from his researches:—

NITRIFICATION.		Parts.
Soil {	Earth.....	20
	Ashes.....	4
	Decayed manure.....	3
		Quantity of Nitre.
Upper Layer.....		440
Middle do.		441
Bottom do.		009

From the above you will gather that in the upper part

of a bed (1 metre in depth, and composed as above shown) there is far more nitre than in the lower portion of it. These researches of M. Millon throw much light on those published some years since by M. Boussingault, who ascertained the rate of proportions of nitre that exist in various qualities of soils and also the influence of manured land on the production of nitre in soils. Thus M. Boussingault found that the quantity of nitre in manured land was a mere trace; in uncultivated land there were from 1 to 0.5 in 1,000 parts of soil, whilst in cultivated land, and in highly manured ground, 18 parts in 1,000. He further observed that if he manured a piece of land, the 7 days there were 12 parts of nitre per 1,000; in 17 days, 81 parts; in 15 days more 233; in 15 days more 280; and in 15 days further 260; and then the quantity decreased rapidly. M. Millon has clearly demonstrated that the substance which first absorbs, and then helps the conversion of the ammonia into nitric acid, is the one known by chemists under the name of humine or humic acid. The presence of a small quantity of nitrates and traces of nitre in uncultivated land may be due to two different sources.

First, Liebig, as we have already stated, demonstrated some years since, and his results have been confirmed by other chemists, that there always exist in the atmosphere small quantities of nitric acid, which are brought down to the soil by rain-falls.

Secondly, M. Cloez has recently demonstrated that the mere passage of purified air over porous substances is sufficient to force a small amount of air and oxygen combine together so as to produce a small quantity of nitric acid. Further, all soils, so far as we are aware, contain organic matter, with which the soil comes in contact from time to time. The tenacity with which soils retain organic matter is very remarkable, as Uralsini has lately proved that if you treat a soil several times with strong muriatic acid, and wash the residue with water so as to remove all traces of acid, still, in that residue you will find the presence of organic matter. The following researches prove that the nature of this organic matter may be either considered as being similar to humine, as shown by M. Millon, or similar to cellulose, as shown by Verdeuil, or of a nitrogenated nature, as demonstrated by Baron Paul Thenard. The elaborate researches of this gentleman are most interesting in many points of view, and, without entering into details, allow me to state that he has extracted from decayed dung, as well as from soils, an acid which he has called fomic acid. This nitrogenated acid is insoluble in water, but freely soluble in weak ammoniacal liquors, thus facilitating its absorption by plants when rotten dung is laid on land as a manure. As this solubility of the fumate of ammonia soon disappears, for immediately that fomic acid comes in contact with peroxide of iron or oxide of aluminium (alumina), it forms an insoluble compound, which presents great stability, explaining at once how land manured once can retain with tenacity the essential nitrogenated elements of the manure which it had one, two, or three years previously. What enhances the value of these recent researches is that Baron Thenard has succeeded in producing artificially the acid which he has discovered in rotten dung, and that by simply heating starch, sugar, gum, or substances existing in straw and other vegetable matters, with ammoniacal salts or nitrates, it being employed by him as a substitute for what we may conceive takes place under the slow action employed by nature to accomplish her general purposes. If Baron Liebig's views respecting the importance of adding mineral matters to exhausted soils were too exclusive, as tending to establish that it was necessary to use other vegetable and animal manures for a farmer to produce remunerative crops, still, there cannot be a doubt that he has rendered great service to the progress of agricultural chemistry by drawing the attention of scientific men to the general composition of soils, and enabling them to point out the

essential mineral substances that a soil should contain for it to claim the title of being fertile.

The most complete and elaborate researches which we possess on this intricate subject are due to one of our leading agricultural chemists, Dr. A. Voelcker, who has published in this year's *Journal of the Royal Agricultural Society of England* (p. 128), of which society he is the appointed chemist, a paper on some of the causes of the unproductiveness in soils, and the following table will give you not only an idea of the extent of his labours, but also point out the difference there is in the composition of soils, and that if in a soil there exists a great excess of one substance, as compared with others that compose it, that soil becomes unproductive:—

COMPOSITION OF UNPRODUCTIVE PEAT LAND, CLAY, CALCAREOUS, AND SANDY SOIL.

	Calcareous soil.	Sandy soil.	Clay soil.	Peaty soil.
Moisture	2.65
Organic matter and water	4.56	7.94	49.07
Oxides of iron and alumina	7.80	5.98	10.95	10.88
Carbonate of lime	78.807	.39	.86	2.29
Magnesia82526	.75
Potash and soda	traces	.28	.39	.90
Phosphoric acid24210	.06
Sulphuric acid	1.54680	1.04
Silica	16.710	86.19
Insoluble silicious matter...	6.090	...	79.20	35.01
	100.000	100.00	100.00	100.00

Dr. Voelcker summed up his researches on the unproductiveness of soils in the following words:—

"Having spoken at some length of a variety of conditions which appear to me to affect the fertility of the land, my subject perhaps may be usefully brought to a close by a brief statement of what, in my opinion, the chemical analysis of soils can determine, and what it necessarily must leave undecided.

"In the first place I would remark, that the chemical analysis of soils can give very decided answers to the following questions:—

"1. Whether or not barrenness is caused by the presence of an injurious substance, such as sulphate of iron or sulphide of iron?

"2. Whether soils contain common salt, nitrates, or other soluble salts, that are useful when highly diluted, but injurious when they occur too abundantly?

"3. Whether or not barrenness is caused by the preponderance of—Organic matter, or lime, or sand, or pure clay?

"4. Whether sterility is caused by the absence or deficiency of—

"a. Lime.

"b. Phosphoric acid.

"c. Alkalies, especially potash.

"d. Or available mineral (ash-constituents) matters generally.

"5. Whether clays are fertile or barren?

"6. Whether or not clays are usefully burnt and used in that state as manure?

"7. Whether or not land will be improved by liming?

"8. Whether it is better to apply lime or marl or clay on a particular soil?

"9. Whether special manures, such as superphosphate or ammoniacal salts, can be used (of course discreetly) without permanently injuring the land, or whether the farmer should rather depend upon the liberal application of farm-yard-manure that he may restore to the land all the elements of fertility removed in the crops?

"10. What kinds of artificial manures are best suited to soils of various compositions?

"11. Whether deep-ploughing or steam-cultivation is likely to be useful as a means of developing the natural stores of plant-food in the soil?

"12. Whether the food of plants in the soil exists in an available or inert condition?"

(To be continued.)

Proceedings of Institutions.

MARLBOROUGH READING AND MUTUAL IMPROVEMENT SOCIETY.—The twenty-first annual report, presented at Michaelmas last, states that, although neither the number of members nor the income of the society has quite reached that of the preceding year, the balance in the treasurer's hands is about £2 more than at the corresponding period of last year. The committee having felt it their duty to limit the number of their lectures for the approaching season, have yet been enabled to make such engagements as cannot, they think, fail to meet with the approval of the members; they have also, after much consideration, determined not to issue season tickets, as it is believed ladies, not members of the society, who may wish to attend any of the lectures will not hesitate to take the ordinary tickets of admission. Owing to the prospect of a less sum being required for lecture purposes this year, the committee think it would be desirable to expend the sum, which it is hoped will thus be available, in a further increase of the society's library. The receipts have amounted to £169 8s. 9d., and there is a balance in hand of £26 7s. 3d.

SOUTH-EASTERN RAILWAY MECHANICS' INSTITUTION.—The report for the half-year ending 30th September last (being the thirty-sixth report), says that the present position of the Institution is highly satisfactory. There is always a diminution in the attractions of institutions of this kind during the summer months, but on this occasion, however, the falling off has not been so great as formerly. The present number of members is 215, being an increase of 30 over the corresponding period of last year. Three volumes have been added to the library during the half-year. The books have all been carefully examined, and a great number of them have been substantially rebound. The library now contains 1,403 volumes in excellent condition. Upwards of 1,000 volumes have been in circulation during the half-year; and the issues show that works of an intellectual and instructive character are occupying the attention of the members more than formerly. Two of the members were successful in the examinations of the Society of Arts, in May last, William Griffiths obtaining a first-class certificate in arithmetic, and Richard Giles a second-class certificate in the same subject. The former has, therefore, become entitled to 12s. worth of books from the Institution, and the latter to 8s. 6d. worth of books. The council would be very pleased if the members would more extensively avail themselves of these examinations. Arrangements have again been made to enable the members of this Institution to attend the whole course of lectures in connexion with the Ashford Institution, free of charge. The vocal music class was carried on successfully for the first three months of this half-year. The council recommend the formation of classes for the winter months, in arithmetic, French, mechanical drawing, vocal music, grammar, and composition; and they hope to make satisfactory arrangements for carrying them into effect. The council would also be very pleased to see the chess club revived amongst the members. The accounts show that the financial position is exceedingly gratifying. The sum of £67 11s. 9d. was realised by the excursions to Boulogne and Dover, on the 1st of September, which were so liberally granted by the directors of the South-Eastern Railway Company, in aid of the funds of the Institution. The balance-sheet shows that the receipts amounted to £129 15s. 5d., and that there is a balance in hand of £84 9s. 9d.

EXAMINATION PAPERS, 1865.

(Concluded from page 739.)

The following are the Examination Papers set in the various subjects at the Society's Final Examinations, held in April, 1865:—

GEOMETRICAL DRAWING.

THREE HOURS ALLOWED.

The constructions must be accurate, and show clearly, by plain and dotted lines, with appropriate letters of reference, the principles on which they are based. They may be put in ink or left in pencil, at the discretion of the candidate, provided they are distinct.

No deviation from the conditions of the questions can be admitted; and since no candidate must answer more than one question from any one section, he is advised not to attempt more than the time will admit of his completing, since little or no credit will be given for incomplete or inaccurate answers.

I.

Divide a line 3·75 inches long—

1. Into two segments, so that the rectangle contained by them may be 2 inches in area.
2. Into two segments, such that the squares described on them may be as 8 : 2.
3. Into three segments, such that the rectangle contained by the whole line and the less segment may be equal to that contained by the other two.

II.

Construct a triangle from one of the following conditions—

1. Its sides as 3 : 3·5 : 4 and their sum 8 inches.
2. Its sides in that ratio, and its area 4 inches.
3. Its base 2·5 inches, its sides equal, and the angles at the base double that at the vertex.

III.

1. The sides of a rectangle are 2 and 8 inches; construct an equilateral triangle equal to it in area.
2. Construct a regular pentagon of 2 inches side, and a regular hexagon equal to it in area.
3. Inscribe a square in a hexagon of 2 inches side.

IV.

1. Two indefinite lines contain an angle of 50° , draw a circle of 1 inch radius to touch both.
2. A point is 1 inch from the circumference of a circle of 2 inches radius, draw a line from the point to cut the circle so that the intercepted chord be 2 inches long.
3. Draw a chord in a circle of 2 inches radius, so that the angle in the greater segment cut off by it may be 70° .

V.

1. Draw the plan of an equilateral triangle of 2·5 inches side when its corners are 1, 1·5, and 2·5 inches above the paper.
2. A square of 2·5 inches side lies in a plane inclined to the paper at an angle of 35° , and one side of the square is inclined to the paper at 20° , show it by a plan and elevation.
3. Draw the plan of the same square when two of its sides are inclined at 20° and 40° to the paper.

VI.

1. Draw a plan and elevation of a cube of 2·5 inches side when three of its corners are 1, 2, 2·5 inches above the paper.
2. Draw the same cube when the planes of two of its faces are inclined at 35° and 70° to the paper.
3. A right prism, 3 inches long, with a pentagon of 1·25 inches side for its base, is to be represented in plan and elevation when the line joining one corner and the centre of the opposite end is vertical.

VII.

1. A sphere of 1·6 inch radius lies on the paper; represent an indefinite plane inclined at 50° touching the surface.

2. Draw the plan of the circle in which a plane may the same inclination of 50° cuts the sphere at 1 inch from its centre.

8. A right cone and a right cylinder have the same circle of 1·5 inches radius for their common base, and height of 4 inches; determine the sections of both, cut by a plane inclined at 70° to their common axis, and passing through its middle point, the true forms of the same to be given.

VIII.

A rectangular block 4·5 inches long, 3 inches wide, and 2·25 inches high, has a prism of the same length, breadth, and 1·5 inches high, resting on its upper surface; represent this solid, either—

- a. By a plan and elevation on a plane equally inclined to its two vertical faces.
- b. By an isometrical projection.
- c. By a perspective projection, the distance of the point of sight, &c., being at pleasure.

THEORY OF MUSIC.

THREE HOURS ALLOWED.

I. RUDIMENTS OF MUSICAL GRAMMAR.

(Nos. 1 to 6 must be answered on music paper, and in the order in which they are put.)

1. Put time signatures to

2. Write the signatures (essential sharps or flats) of (F), Sol (G), La (A), and Si b (Bb) major; and of D, Re (D), Mi (E), and Fa (F) minor.

3. Transpose the following a third lower.

4. Write the scale of Re (D) minor, in every form which you are acquainted.
5. Explain, by one or more examples of each, the following words:—Tetrachord, Syncopation, Augmented Second, Double Dot.
6. Write the following on the bass staff, at the same pitch.

7. What intervals do the following form?

8. In what scale are these two notes?

II. HARMONY, COUNTERPOINT, AND MUSICAL HISTORY.

(Nos. 1 to 6 to be answered on music paper.)

1. Place such a clef before the following as will suit La (A).

2. Resolve the following dissonances.

3. Correct the following, without altering the first word.

4. Add three parts to

5. Add a part in any kind of counterpoint above or below the following.

6. Harmonize the following.

7. State anything you know about English music and English musical composers in the seventeenth century.

FIRST WORKING MEN'S EXHIBITION AT VIENNA.

An Exhibition of this character has lately been held in Vienna. It appears, from the catalogue which has been issued, that this exhibition has been got up by certain individuals there, owing to the success which has attended such exhibitions in England.

Towards the end of last May the Minister of Commerce gave his assent to a request, made by Dr. Karl Helm, Ludwig Lobmeyr, Josef Nikola, and others, that a Working Classes Industrial Exhibition should be held in Vienna. The above-named gentlemen, with Herr Leon Mandel and others, declared themselves prepared to bear all the preliminary expenses.

On the 8th of June the programme was issued by the permission of the government. The Imperial Royal Horticultural Society lent their grounds gratuitously for the proposed purpose, and the press supported the movement in every way. Papers, descriptive of the origin and object of the exhibition, were then distributed among various Societies whose objects were the promotion of the industry of the working man, among which may be mentioned the Catholic Trade Society, the Society for the Promotion of Business among Native Jews, the Female School Society for Gratuitous Female Trade Instruction, the Female Charity Society (as regards its female trade instruction), the Imperial Royal School for the Education of the Blind, and the Home for the Maintenance of the Adult Blind. The Burgomaster lent the Common Council Chamber for the holding of a meeting, which took place on the 14th of June, at which Drs. Helm, Nikola,

and Dr. Stamm gave full information relating to the holding of the exhibition. It had been the intention of the committee to give money prizes, but they ultimately decided, and stated in their programme, that for excellence in workmanship the men would receive silver medals, to be awarded by a jury of working men.

The project found support on all sides, and many persons contributed money for the purpose; and further, the Trades Union Society declared itself willing to co-operate in the awarding of prizes, and the like co-operation of known judges was promised, the distribution of prizes being arranged to take place at the close of the exhibition.

The following programme was issued:—

A Working Classes Industrial Exhibition, of the same character as those lately held in London, will be held in the Imperial Royal Horticultural Grounds, next the Town-park, on the occasion of the public *fêtes* in August.

1. To this exhibition will be admitted (a) articles useful for housekeeping, health, and daily life; (b) productions, models, and designs of articles which, although not of public use, are important in a scientific or artistic point of view, or which at least show the inventive genius of the exhibitor; (c) productions worthy of notice out of the ordinary line of the exhibitor's business.

On account of the great difficulty of making a strict and complete classification of the articles for Exhibition, they will be divided into the following heads, viz.:—

- I. Objects of art.
- II. Professional art work.
- III. Trade productions.
- IV. Female hand work.
- V. Amateur work.
- VI. Articles which are new in mechanism or in the application of physical or chemical science.
- VII. Miscellaneous.

2. Persons desiring to exhibit must (a) reside in Vienna within the police radius; (b) belong either to the working classes, such as foremen, assistants, journeymen, hand-workers, apprentices; or (c) be, as regards their work, amateurs; and (d) have made the exhibited work themselves.

3. Good workmanship will be rewarded, according to the awards of a jury of working men, by prizes (silver medals).

4. Exceptional articles, worthy of place in the Exhibition, suitable for the embellishment of the Exhibition, or affording information, as well as other objects, will be admitted, though not shown for prizes.

5. Exhibitors must bring the articles they exhibit at their own cost to the place of exhibition, and take them away on the day after its close. Articles not taken away on that day will be disposed of for the benefit of some charitable object.

6. The day of opening will be made known by special placards.

7. Allotments of space can be made until the 31st July, 1865, after which no more will be made.

The admitted articles must be brought to the place of exhibition the day before its opening, where they will be received from 8 a.m. to 7 p.m.

8. The Exhibition will be open daily from 8 a.m. to 7 p.m.

9. The price of admission will be on the opening day 30 kr. (7½d.); on other days 10 kr. (2½d.); children, half-price. All the profits will be appropriated to some useful public object.

BRITISH ASSOCIATION, 1865.

INDIA RUBBER CONSIDERED IN REFERENCE TO ITS APPLICABILITY AS AN INSULATOR FOR TELEGRAPHIC CONDUCTORS. BY WILLIAM HOOPER, Esq.

The following paper was read in Section A, and again on the following day, in Section G, by request of that Committee:—

The difficulties which have preceded the successful issue of india rubber insulation are precisely the same which were encountered for many years after the introduction of this substance as a branch of manufacture. Native or raw india rubber, when in good condition, may be kept for years without sustaining any deterioration, but in certain stages of its manufacture it becomes susceptible of decay, which is accelerated by exposure to air and light. The decay of india rubber is now well known to be the result of oxidation, and is characterized by a gradual tendency to fluidity; its first stage of decay is recognized by a diminution of its elasticity, and by its becoming glutinous or sticky, and finally being reduced to a tarry-looking fluid, which state it always preserves.

The ultimate composition of india rubber is represented by the formula $C_2 H_4$. The analysis of Dr. Miller accords, with tolerable exactness, with this formula—he found in 100 parts 85.82 carbon and 11.11 hydrogen. The sample which he analyzed, however, contained 3.07 oxygen, and evidently could not have been pure caoutchouc. Neglecting the oxygen, the composition of pure caoutchouc, as deduced from its empirical formula ($C_2 H_4$), is 84.66 carbon, and 12.33 hydrogen, the difference in which from the results by Dr. Miller's analysis is practically nothing, and confirms the accuracy of the original analysis.

India rubber in a manufactured state contains more or less of its oxidized product, which produces the colour recognized in this substance, pure caoutchouc being colourless. The word caoutchouc should properly be applied to that pure principle of carbon and hydrogen which forms the greater part of manufactured india rubber.

The process by which india rubber is rendered suitable for the purposes of insulation, consists of an operation which involves its partial oxidation, and unless this oxidation is arrested, the india rubber becomes useless as a permanent insulator. India rubber, when thoroughly washed and dried, is masticated; by which means it becomes highly coloured, and is afterwards found to contain a variable amount of its oxidized product. By mastication, the india rubber is converted into solid masses or blocks, which are cut up into slabs or sheets; the sheets are again cut into tapes, which is the only form for applying it to telegraphic conductors. The tapes being put on the wires, another operation is required to reduce them into a perfectly uniform and solid covering; this has been usually effected either by the use of solvents or the direct application of heat, both of which plans are seriously objectionable. By the application of solvents the india rubber becomes more susceptible of oxidation, whilst the direct application of heat induces a molecular change more favourable to its oxidizing. Wires insulated by either of these means indicate a very high state of insulation when first made, but as the india rubber decays the insulation is reduced and ultimately destroyed.

About two years ago five lengths of india rubber insulated wires were supplied to the government for submersion in the Persian Gulf, which, with the exception of one, have failed almost entirely. I was favoured with a report from government a few weeks ago, made by Mr. F. C. Webb, from which it appears that the length remaining perfect is, at the temperature of 75° Fahr., three times better than the gutta percha insulated wires which form the core of the Persian Gulf Cable. Mr. Webb stated in his report that he did not know who were the respective manufacturers of these several lengths, but he brought home a piece cut from each length for identification. On my calling upon him, he placed the several pieces before me, and I had no difficulty in recognizing my manufacture. Mr. Webb at once said that it was off the length which he had reported to the government as being the only one that remained perfect. It will be seen from these numbers that it is the highest degree of insulation yet practically attained. A length of 1,610 yards, tested under a pressure of 6,000 lbs. per square inch, and the same length, tested again under pressure of 4,480 lbs. per square inch, maintained for nearly eighty hours, showed

an increase in its insulation resistance; and on removal of the pressure it was not found to have diminished, as has been stated to be the case with some specimens of india rubber insulated wire. The length under this test retained two joints. The high results obtained from joints my insulated wires have entirely removed all apprehensions on this important point; and there is no practical limit to the age of the material in which joints can be safely and reliably made. Five miles of my insulated wire, containing in each case eight and twelve joints, were unimpairedly maintained at the temperatures of 75° and 55° Fahr. respectively for 240 hours, and on being reduced to the initial temperature were found to have suffered no permanent change.

The facilities offered by my process for producing insulated wires of nearly identical degrees of insulation, and for reducing the most minute fault, enable me to bring forward this system as one by which absolute freedom from defects can be insured. This is a point intimately connected with the success of submarine telegraphic cables; for it frequently has happened that minute faults have on submergence enlarged into sources of serious annoyance. The central position of the conductor is unaltered by any elevation of temperature; and, as it maintains a high degree of insulation at 150° Fahr. or even higher temperatures, it is peculiarly applicable for tropical seas. In its resistance to mechanical injury it surpasses all other materials which have been tried for insulating telegraphic wires. The low inductive capacity of india rubber renders it especially suitable for telegraphic cables, and by my process the low induction of india rubber is maintained.

Sir Charles Bright, Mr. Latimer Clark, and Professor William Thomson have favoured me with the details of some very interesting investigations which they have gone through, on the qualities of my insulated wires; and, as Professor Thomson was not aware that Sir Charles Bright and Mr. Latimer Clark were giving their attention to the subject, it is highly satisfactory to find how nearly they agree in reference to the inductive capacity compared with gutta percha. Professor William Thomson found the induction of my wire as compared with that of gutta percha to be as 100 to 135, whilst Sir Charles Bright and Mr. Latimer Clark found it as 100 to 136. Mr. William Whitehouse examined a length of one of my higher insulated wires, which he found as 100 to 160. As the use of signalling is governed by the retardation arising from inductive charging, the transmission of messages will be inversely as these numbers, that is to say, that 135 to 136 messages could be sent through an Atlantic cable by using a conductor insulated with india rubber according to my process, whereas 100 only could be sent in an equal time by using a conductor insulated with gutta percha. This has a most important bearing in a financial point of view, since the cost of the insulation by my method would be greater, and in some of its forms considerably less, than that paid for insulation by gutta percha.

(Several lengths were shown to the sections, and also a diagram illustrating the effects of temperature, as compared with gutta percha.) The mathematical properties of the curve were, for the temperatures determined on the core, similar to those obtained with gutta percha, but the differences in the insulation for increase of temperature were not so great as are observed to take place with gutta percha.

The following table gives the insulation resistance in millions of B. A. units of my core and gutta percha at different temperatures:—

	0° Cent.	24° Cent.	38° Cent.
Gutta Percha (Persian Gulf Core).....	3205	170	4
Mr. Hooper's Core.....	71036	6328	250

A length containing a joint that had been kept in a boiling solution of salt (220° F.) for twenty hours, and placed in a vessel to be again heated to that temperature

and tested; but the committee decided that it was unnecessary to test it, or any of the specimens and joints exhibited.

The specimens and joints had been made at different periods during the last four years, and were shown for the purpose of being examined, to see that they had not suffered any change. Amongst the specimens was a length of half a mile with a joint, cut from the five miles referred to above.

During the discussion which ensued,

Mr. SIEMENS, F.R.S., expressed his concurrence with Mr. Hooper's remarks on the value of india-rubber insulation, as compared with that of gutta percha, except that india-rubber improves in insulation under pressure; with that exception he considered Mr. Hooper had kept within rather than gone beyond their relative properties. Difficulties had hitherto been found in the application of india-rubber as an insulator, and it would be interesting to the Section to know how Mr. Hooper had overcome them.

Mr. FLEMING JENKIN, F.R.S., stated that he had for some years been acquainted with Mr. Hooper's method of insulation by india rubber, and he had never seen a length of his manufacture that indicated loss or decay. He considered the difference between the result of testing under pressure by Mr. Siemens and that by Mr. Hooper was caused by Mr. Hooper's process in consolidating the india rubber; his experience tended to confirm the statements made by Mr. Hooper. He thought it exceedingly desirable that Mr. Hooper's cable should be practically tested by being submerged and worked, as it was evident that for long lengths and tropical seas it seemed to possess very valuable properties as compared with gutta percha.

Mr. GASSIOT, F.R.S., said he thought the experiments in connection with the submergence of the two Atlantic cables had demonstrated that the two mechanical difficulties of the task could be overcome with a moderate degree of care and attention; and the most important consideration was that it had been demonstrated possible to lay a cable between Ireland and Newfoundland, but they must take care and not do as had been done in other cases, viz., lay down a cable which would only last two or three years. In this connection Mr. Gassiot pointed out the importance of the cable produced by Mr. Hooper, although he questioned if the time had arrived for a final experiment in the laying down and working of an Atlantic cable. He thought the bearing of india rubber in its various qualities as an insulator ought to be satisfactorily and conclusively determined before the laying of another cable in the Atlantic was attempted. If they went on from year to year unsuccessfully, they would absorb any amount of capital; and the citizens to whom they must go for material support would close their purses; whereas, if they only waited the result of the experiments being diligently prosecuted by electricians, they would be able to come forward with a scheme which would not only be a success, but practically with the best cable. There would then be no difficulty in raising capital, for there was no doubt that the Atlantic Telegraph would be laid; but before again embarking on the enterprise every experiment should be made. This was the only prudent and safe course to adopt. He understood the Government had sent out two or three years since several lengths of insulated wire by different manufacturers to Kurrachee, including one by Mr. Hooper, to be practically tested by immersion in the Indian seas, and a report had been lately furnished to the Government stating that all of them except the length supplied by Mr. Hooper had failed; the report to Government went on to state that Mr. Hooper's cable tested three times better than the Persian Gulf cable, which is insulated with gutta percha; the Government had, in consequence, given Mr. Hooper an order for about fifty miles of his cable, to be supplied forthwith. He considered the Atlantic Company might well follow the example set by the Government.

Fine Arts.

GRAND PRIZE OFFERED BY THE FRENCH ACADEMY OF BEAUX-ARTS.—The Academy, as trustee of the funds bequeathed by M. Bordin, has offered a prize for a subject which is peculiarly interesting when taken in connection with the coming Universal Exhibition. The theme selected is stated in the following terms:—"To examine and demonstrate the amount of influence exercised on art by circumstances, national, political, moral, religious, philosophical, and scientific. To show to what extent the most eminent artists have shown themselves independent of, or affected by such influence." The prize is, nominally, a gold medal, of the value of 2,900 francs, or £116, and the essays are to be sent in to the Secretary of the Institute on or before the 15th of June, 1867.

BUST OF RICHARD COBDEN FOR VERSAILLES.—While Mr. Woolner, the well-known English sculptor, is executing a bust of the late Richard Cobden to be presented by Mrs. Cobden to the Emperor Louis Napoleon, M. Olivia, a French sculptor, has been engaged on another bust, which is just finished, and which was ordered by the Emperor to be placed in the gallery at Versailles.

Manufactures.

AVENTURINE.—The composition of Venetian aventurine or aventurine, a vitrified substance containing specks of gold, so much used for brooches and other ornaments, remained for a long time a secret, but two chemists, M.M. Frémy and Clemandot, discovered a method of producing it. Their method was to fuse together and keep heated for twelve hours a mixture of three hundred parts of pounded glass, forty parts of protoxyde of copper, and eighty parts of oxide of iron, and then to allow the mass to cool very gradually, and in this manner they obtained fine specimens of this artificial precious stone. M. Pelouze, another French chemist, has just communicated another method to the Academy of Sciences; he takes 250 parts of fine sand, 100 parts of carbonate of soda, 50 of carbonate of lime, and 40 parts of bichromate of potash. The glass or enamel thus obtained contains from six to seven per cent. of oxide of chromium, of which about half is combined with the glass, while the rest remains free in the form of those brilliant metallic specks which give the peculiar character to the composition. The Parisian lapidaries who have operated on this new material, give a very favourable account of it as likely to furnish an important material to the jewellers' trade; it is said to be equal to the finest old Venetian aventurine, the metallic lustre of the enclosed specks being very brilliant, and the composition so hard that it will readily scratch and cut glass, and, consequently, is susceptible of a very high polish, and not liable to have its surface destroyed by ordinary abrasion.

SPLENDID TRIBUTE TO A MANUFACTURER IN FRANCE.—M. Carrier Belleuse, the French sculptor, who for several years was engaged in the Staffordshire Potteries, has been entrusted with the execution of an allegorical group in bronze and marble, which is to be presented to M. Henri Schneider, of the great iron works at Creusot, by the commercial and working population of the place (the subscription list containing more than nine thousand names), on the occasion of the birth of that gentleman's first child. The group is to represent Industry endowing the world with light, peace, and plenty, and the base will be decorated with three figures, representing Mining, Metallurgy, and Mechanics. The works at Creusot are, perhaps, the most important in France, and well known to all who are acquainted with engineering on the Continent. After the death of the Comte de Morny, M. G. O. Schneider performed the duties of President of the Assembly with great distinction.

INDUSTRIAL AND ARTISTIC EXHIBITION AT BORDEAUX.—The Bordeaux Exhibition has more than fulfilled the expectations raised concerning it; the number of exhibitors exceeds two thousand, and the buildings are almost inconveniently crowded with objects of industry and art. Besides agricultural and industrial materials and products, the exhibition includes a retrospective museum, and is surrounded by supplementary buildings, in which a considerable number of machines are exhibited in movement. This exhibition, like all others that have taken place recently in France, shows how vast a stride has been made in that country within a few years in mechanical, agricultural, and other industries. The contents of the Bordeaux Exhibition consist principally of machinery and metal work, clock and watch work, jewellery, cabinet ware, carriages, cutlery, arms and ammunition, carpets and tissues, agricultural machinery and products, to which latter section the Imperial Government has contributed an important collection of Algerian produce. A great misfortune happened the other day to the exhibition; the rain fell in such enormous quantities and so suddenly that the drains were insufficient to carry off the flood of water, which inundated a considerable portion of the annexes. At one moment a boat might have passed along some of the main avenues of the building, and a number of visitors were obliged to seek refuge for a time on planks and other floating materials, and wait until the waters had subsided. The buildings being temporary, and of very fragile construction, there was great danger that they might give way; as it is, the mischief done to steel and other articles must be considerable.

Commerce.

THE COTTON TRADE.—"Amongst many other gratifying evidences of the future prosperity of the cotton trade, we notice with pleasure," say Messrs. Travers, "that the revenue arising from the cultivation of the cotton plant in Egypt bids fair to be so large as to render unnecessary the Pacha's recent negotiations for a loan of three millions. Enormous as the destruction of property must have been during the American war, and disastrous as its effect was upon us, one great advantage has certainly arisen from it, and that is, the general impetus to the cultivation of cotton in all lands where it is found practicable. America has hitherto been considered as almost the only quarter to which we should look for our principal supplies of cotton; but our daily increasing experience, stimulated, if not actually called into existence, by the painful scarcity entailed upon us by the American war, has taught us that there are very few countries within the limits of the tropics where the cotton plant may not be cultivated with ease and profit. In the course of some years we may hope to see such a state of things actually in existence; and we shall not then witness that remarkable phenomenon—our entire system of commercial finance affected to a serious extent by so unimportant a consideration as the accidental and partial deficiency of one single article of produce from one quarter of the world. The President of the Manchester Chamber of Commerce stated on a recent occasion that England was prepared to consume as much cotton as could be produced in the whole world for the next three or four years. Without entirely endorsing so strong a statement as this, we can, nevertheless, express our firm conviction that the cotton trade is destined to attain a much larger development than it has as yet achieved."

COFFEE.—The following remarks on the growth and future prospects of the coffee plant, are from reports by Her Majesty's Consuls at the localities mentioned:—*Feejee.*—"Coffee has been introduced here from Tonga, and there are at present 20,000 trees in a flourishing condition; two-thirds of these will bear fruit next year. Hitherto the berries have been required for seed, as the trees so produced are found to be healthier and more productive than those imported. In the course of a few

years we may hope that coffee will form an important export from the Feejee and Friendly Islands. In the latter group (Tonga) coffee trees raised from seed will bear fruit the fourth year." *Borneo.*—"Little attention has been paid to the growth of the coffee plant; from accounts, however, the hill climate would appear to be very favourable to its growth. Coffee is largely exported from the neighbouring islands of Celebes and Java; it is, therefore, to be hoped that it will some day be exported also from this province." *Bremen.*—"The coffee trade was, compared with former years, unsatisfactory and small. Owing to bad harvests in the coffee-growing countries, prices there became too high compared with those in Europe, and the stock at Bremen during the first part of the year was so small that little or no business was done; however, after the great autumnal auctions in Holland, the coffee trade rallied a little, but never attained that importance which used to make it, next to tobacco, the principal branch of business here." *Hamburg.*—Hamburg is the largest coffee market in Europe, and supplies both the interior of Germany and the countries to the north. The quantity of coffee, of all sorts, imported last year, was 784,428 cwts. The greatest quantities were furnished by Venezuela, Brazil, and Java; but the coffee of St. Domingo, and that of Porto Rico were also in good demand. Nearly half of the coffee brought to the Hamburg market is originally imported at Altona, and transferred from thence across the frontier. Prices have been constantly rising for some years past." *Spain.*—"Coffee is an article which the Californian market will take of a large extent. In this quarter the plantations which have been commenced are not yet in a sufficiently forward state to be able to export, but they promise well for the future."

Colonies.

TRADE AT MELBOURNE.—The official returns show that the value of the imports and exports at the port of Melbourne, from the 1st January to 19th August, 1865, as compared with the corresponding portion of the previous year were:—Imports, 1864, £9,068,738; 1865, £7,904,794. Exports, 1864, £7,521,155; 1865, £6,513,519. There is, therefore, a decrease during the present year in the value of imports of £1,124,014, and in the value of exports, £1,008,626. These figures are rather significant with respect to the operation of the new tariff, not so much as regards the consumption in the colony, but as affecting its intercolonial trade as the chief entrepôt for Australia.

BUILDING AT MELBOURNE.—A steady activity has recently prevailed amongst the building trades in Melbourne for several months, and the results are visible in the shape of new buildings in all or most of the main thoroughfares of the city. The erection of dwelling houses in the outskirts and suburbs of Melbourne has been carried on very extensively, and a marked improvement may be discerned in the character of the dwellings built now over that of those which were erected in earlier years; but besides there have been a large number of buildings of importance and conspicuous appearance added to the city within the last few months.

SOUTH AUSTRALIA.—The harvest of unprecedented bounty which was bestowed upon this colony in December, 1863, the high prices for which markets were found for nearly the whole of the crop, the increasing productiveness of many mines both of copper and lead, and the satisfactory state of the London wool market, combined to render the year 1864, and some portion also of 1865, a period of great prosperity to the producing interests of the colony, in which prosperity the manufacturing, commercial, and labouring classes shared naturally; but this season the profits of the mining interest must be seriously diminished by the recent fall in the value of copper, both in England and India, and the visitation of drought in

rious interest to those concerned in pastoral pursuits, and has caused a nearly general failure of the lambing throughout the most favoured districts of the colony. The possibility in many places of fattening stock for market, and in others of driving them there if fattened, is annoying; all these combined tend to check the growth of wool, which will seriously reduce the quantity and deteriorate the quality of this year's clip.

IMMIGRATION TO AUSTRALIA.—The influence of the old discoveries on immigration and of immigration on ages are curiously shown by the following figures:—In 1850, 1,182 male immigrants arrived in Sydney, and wages were 4s. 6d. per diem; in 1851, the male immigrants numbered 742 (the news of the gold discovery in May not having begun to operate), and wages were 7s. 8d. upon an average of the year; in 1852, the number of male immigrants was 1,685, and the rate of wages 9s.; in 1853, 2,706 male immigrants arrived, and wages rose to 16s.; in 1854, 2,816 male immigrants arrived, and wages rose to 21s. per day; in 1855, the number of male immigrants was 5,141, and wages were 15s.; in 1856, 2,884 male immigrants arrived, and wages dropped to 13s.; in 1857, 4,415 male immigrants arrived, and wages rose to 14s.; in 1858, 2,860 male immigrants arrived, and wages dropped to 10s. 6d.; in 1859, 2,112 male immigrants arrived, and wages were still 10s. 6d.; in 1860, 351 male immigrants arrived, and wages were 11s.; in 1861, 794 male immigrants arrived, and wages were 11s. 6d.; in 1862, 1,172 male immigrants arrived, and wages were 12s.; in 1863, 1,966 male immigrants arrived, and wages were 10s. A variety of causes influenced the rate of wages besides the number arriving from Great Britain; but it will be seen from this analysis that the arrival of male immigrants, so far from depressing the labour of existing workmen, in some instances advanced it in a very marked degree, and can in no instance be assigned as a cause of depression.

Publications Issued.

INORGANIC CHEMISTRY FOR SCIENCE CLASSES. By Earnside Hudson, F.C.S., F.A.S.L. (*Whitaker and Co.*) This work is intended for the use of beginners in the study of chemistry, more especially for students of science classes.

THE TANNIN PROCESS. By C. Russell. (*Robert Hardwick.*) This is a second edition of Major Russell's original work on the dry process of photography invented by him. In this edition is added an appendix, giving the results of his later experience in its working. This process, as arranged at first, had one serious fault, which rendered it unsuitable for ordinary landscapes than for some other kind of subjects. The use of tannin the author considers to be attended with many advantages, and he has used his best endeavours to find a means of correcting and improving the process.

Forthcoming Publications.

THE SLIDE VALVE PRACTICALLY CONSIDERED. By P. Burgh, engineer. Post 8vo., cloth, with eighteen illustrations. (*E. and F. N. Spon.*)—This work, which will be ready on the 1st of November, will be divided as follows:—Chap. I.—The antecedents of the Slide Valve and Steam Ports in the Cylinder. Chap. II.—The Proportion of Valves and Ports in the Cylinder, Common and Exhaust Slide Valves. Chap. III.—Equilibrium and Double-Ported Valves. Chap. IV.—The proper mode of obtaining the correct amount of Lap. Chap. V.—The Effect of Expansion by the action of the Slide Valve. Chap. VI.—The delineation of the Path of the Crank pin. Chap. VII.—General Observations.

Notes.

PAIS EXHIBITION OF 1867.—A perfect army of workmen is now engaged in draining and otherwise preparing the Champ de Mars for the exhibition building, a very laborious task, for the ground is not only very low, but has never been drained in any way; this preparatory work will, however, be performed in the most thorough manner, and the basement of the building will be underlain with a thick mass of concrete, so that the character of the site will be totally changed as regards level and consequent conditions. The contract for the erection of the great outer zone or gallery of the building, in which the working machinery, and what was called in 1862 the "Process Court," will be placed, has been taken in equal shares by two of the most important firms in France, namely, MM. Gouin and Cie., and MM. Cail and Cie. This gallery forms the outer shell of the building, as may be seen by the plan published from official documents in the *Illustrated London News*, and its face will include the whole of the architectural features of the building. The inner gallery, that which surrounds the central garden, and which is to be devoted to the fine arts, will also, like the outer, be constructed in a very substantial manner; these two portions taken together form in fact the shell of the building, and will act as abutments with respect to the roof, which will cover the whole of the intervening space. The *Journal of Charleroi*, one of the principal centres of manufacture, and especially of engineering, in Belgium, says that a society has been formed at Gilly, in order to enable artisans to visit Paris and examine and report for themselves on the inventions and improvements to be found in the exhibition. The subscription is only seven pence a fortnight, and each subscribing member will have his railway ticket gratis, besides board and lodging in Paris for three days. It is said that a great number have joined the society. Similar arrangements are on foot in France.

FIRE EXTINGUISHER.—A curious apparatus called *l'Extincteur* was tested a short time since on the edge of the Seine, in Paris, and is now offered to the public. It has very much the appearance of one of those *fontaines* carried on the backs of the men who sell liquorice water in the streets of Paris, under the odd name of *Coco*, but it is in fact a soda water machine, containing, in separate compartments, solutions of a carbonate and of an acid, which remain quiescent until a stop-cock is turned, when they give rise to the production of carbonic gas, which causes the water contained in the apparatus, and which of course holds a certain amount of the gas in suspension, to flow from a jet pipe with great force.

INTERNATIONAL POSTAL ARRANGEMENTS.—Another step has been made in international postal reform by a convention passed between France and Belgium on the 12th of the present month of October, and officially announced in the *Moniteur*. By this new convention, the postage of an ordinary letter, weighing one-third of an English ounce, will be reduced from 40 to 30 centimes when prepaid, and from 60 to 50 centimes when sent unpaid; the postage of newspapers and periodical works, from ten to six centimes for 40 grammes, or $1\frac{1}{2}$ of an ounce, while other printed matter will only be liable to a tax of five centimes, or one half-penny, for the same weight; the postage of documents and business papers will be reduced to 50 centimes per 200 grammes; post-office orders will be granted for sums not exceeding 200 francs. The time when the new regulations are to come into operation is not yet published. The effect of the convention, as regards newspapers, will be to diminish the cost of journals sent from one country to the other to the extent of 15 or 16 francs per annum.

PUBLIC WORKS IN FRANCE.—The demolitions, to prepare the way for a grand avenue which will form a direct line from the Théâtre Français to the new Opera House, are proceeding rapidly in the neighbourhood of the Rue

Richelieu. The new boulevard, or avenue, which is to be named either after the Empress or the great tragedian Rachel, will clear away a shabby and disreputable quarter, and let in light and air where both are much wanted. The old campanile tower, over the central entrance of the Hôtel de Ville, has been taken down, and a new one is now being erected in its place, and will shortly be finished. The conversion of the huge and irregular cavity (left by the quarries, which were worked for many years in the Buttes de Chaumont, near Belleville, to the north of Paris) into a public pleasure ground, is going on rapidly, and the works are, perhaps, the most curious of the kind that have yet been undertaken, and are well worthy of a visit. They include the formation of two lakes, with a fall of water over rocks more than 200 feet high, reproducing the famous cascade of Tivoli, at Rome, and the creation of *fac-similes* of the ancient cave of the Sibyl and of the Temple of Vesta. Standing in the midst of the lower lake, into which the water from above falls, is a natural rock, about a hundred feet high, which is being made accessible by means of two bridges, and of winding paths from the base to the summit. The progressive growth of Paris is shown by the following figures:—At the commencement of the fourteenth century there were but 310 streets in the city, and by far the greatest part of these were, in fact, narrow lanes, while all were unpaved, ill-lighted, and filthy in the extreme. During the reign of Francois Premier, in 1545, the number of streets, as shown by existing tax-returns, was only 427. In the time of Henri Quatre, Jacques Sanguin (the provost of the merchants) estimated them for taxing purposes, at 610, including, it is supposed, courts and alleys. At the beginning of the last century, in the reign of Louis Quatorze, when the Court of Versailles was the most splendid in the world, the Paris streets only numbered 635. In 1785, when the boundaries of the city were extended, the streets were increased to 997; and eighty years later, that is to say, 1865, they had reached to 1,433. At the present moment, and including the ancient banlieues, now encompassed by the extended boundary of the fortifications, the number of public ways, streets, courts and alleys, amounts to 2,702. A project of great national importance is now under consideration at the Hôtel de Ville, namely, the construction of a canal from Paris to Pontoise, through the Valley of Montmorency, in order to cut off the numberless sinuosities which render the navigation of the Seine extremely tedious. Pontoise is situated at the confluence of the rivers Viosne and Oise, at about nineteen miles from Paris, and has an important trade in corn, flour, and cattle. The proposed canal will debouch in the Oise, near St. Ouen l'Aumône, and join the Canal of St. Denis at Aubervilliers, near Paris; one or more small branches are included in the project, to which it is not expected any objection will be raised, and the cost of the whole work is estimated at between three and four hundred thousand pounds.

Announcements by the Council.

INSTITUTIONS.

The following Institutions have been received to Union since the last announcement:—

Bassbrook (Newry), Mutual Improvement Society.
Watt Institution and Edinburgh School of Arts.

NOTICE TO MEMBERS.

The One-Hundred-and-Twelfth Session of the Society will commence on Wednesday, the 5th inst., when the Opening Address will be delivered by Wm. Hawes, Esq., F.G.S., Chairman of the Council.

The following are the dates of the Wednesday evening meetings, the chair being taken at eight o'clock:—

1865. November	—	—	15	22	29
„ December	6	13	20	—	—
1866. January	—	—	17	24	31
„ February	7	14	21	28	—
„ March	7	14	21	—	—
„ April	4	11	18	25	—
„ May	2	9	16	23	30
„ June	—	—	—	27*	—

For the Meetings previous to Christmas, the following arrangements have been made:—

NOVEMBER 15.—*Chairman's Opening Address.*

NOVEMBER 22.—“On Water Supply, especially in Rural Parishes and Districts.” By J. BAILLY DENTON, Esq.

NOVEMBER 29.—“On the Proposed Purchase of Railways by the Government.” By WILLIAM HAWES, Esq., F.G.S.

DECEMBER 6.—“On London Milk.” By J. CHALMERS DENTON, Esq.

DECEMBER 13.—“On the Graphotype, a Process for Producing from Drawings, Blocks for Surface Printing.” By HENRY FITZ-COOK, Esq.

DECEMBER 20.—“On Parkesine, its Composition, Manufacture, and Uses.” By OWEN ROWLAND, Esq.

The Cantor Lectures for the ensuing Session

will consist of Three Courses, to be delivered by G. W. HASTINGS, Esq., LL.D., Barrister-at-law; FLEEMING JENKIN, Esq., F.R.S.; and Dr. F. ORACE CALVERT, F.R.S.

The following are the particulars of Mr. Hastings's course:—

LECTURE I.—MONDAY, NOVEMBER 27TH.—“The Effects of the Discovery of the Precious Metals on the Ancient Civilisation of the Mediterranean.”

LECTURE II.—MONDAY, DECEMBER 4TH.—“The Effects of the Discovery of the Precious Metals on Modern Civilisation.”

LECTURE III.—MONDAY, DECEMBER 11TH.—“On Copyright.”

LECTURE IV.—MONDAY, DECEMBER 18TH.—“On Limited Liability.”

The lectures will commence each evening at Eight o'clock.

These Lectures are open to Members, each of whom has the privilege of introducing ONE Friend to each Lecture.

Proceedings of the Society.

CANTOR LECTURES.

“ON SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS.” By Dr. F. ORACE CALVERT, F.R.S., F.C.S.

LECTURE IV.

(Continued from Page 743.)

DELIVERED ON TUESDAY, THE 25TH OF APRIL, 1865.

On some of the Discoveries in Agricultural Chemistry.

Before asking your especial attention to some of the most important mineral matters which exist in soils, I wish to say a few words on some of the researches published a few years since by Professor Way, in which that gentleman showed that soils had the power to retain with great tenacity certain mineral matters, which, although soluble in water, could not be removed from soils even when brought into contact with great quantities of water. He further demonstrates that if he made to percolate through a given quantity of soil certain soluble salts, such as those of soda, potash, and ammonia, these would be retained in the soil, whilst the acids with which these bases had been combined, would unite with some of

* The Annual General Meeting: the Chair will be taken at Four o'clock. No Visitors are admitted to this Meeting.

the elements previously existing in the soil, pass off, and the alkalis themselves remain fixed. Thus, according to him, the retentive power of soils was due to the presence in them of a small quantity of double silicate of alumina. Thus, for instance, a double silicate of alumina and soda, when brought in contact with lime, will part with soda and take up lime; but if this silicate, in its turn, is in presence of magnesia, the lime will pass in solution and the magnesia be retained. If, then, a salt of potash is employed, the magnesia will be removed from the double silicate and the potash take its place. If ammonia be brought in contact with the above silicates, except that of potash, it will substitute itself for soda, lime, or magnesia. These valuable researches prove to farmers that they have nothing to fear as to the loss of any valuable manure, such as compounds of ammonia and potash, which they might employ as manure on their lands, even if these were drained, for the potash or ammonical salts employed by them as manures and spread on the surface, would not pass off in the drainings of the land, but be retained by the soil under the form of a double silicate until required by plants, and decomposed under the influence of that mild but still all-powerful force called vitality. The researches of Professor Way have been extended by those of Dr. Voelcker, who, instead of employing simple salts, employed complicated liquids on various classes of soils, namely, calcareous clay soils, and ferruginous, sterile, sandy soils, and obtained the following results:—

1. That the calcareous clay soil absorbs about six times as much ammonia from the liquid manure, as the sterile sandy soil.

2. That the liquid manure in contact with the calcareous clay soil becomes much richer in lime; whilst during its passage through the sandy soil, it becomes poorer in lime.

3. That the calcareous soil absorbs much more potash than the sandy soil.

4. That chloride of sodium, in conformity with the results of other observers, was not absorbed to any extent by either soil.

5. That both soils removed from the liquid most of the phosphoric acid.

6. That the liquid in passing through the calcareous soil becomes poorer; and, on the other hand, in passing through the sandy soil becomes richer in soluble silica.

These researches of Dr. Voelcker led him to a somewhat different conclusion to that adopted by Professor Way. He does not think that the silicates of ammonia and magnesia that exist in soils, have all the retentive power attributed to them by Professor Way, but that potash and ammonia are retained in soils by the peroxide of iron and alumina which they contain, acting as weak acids with respect to the alkalis. He also considers that it is the same oxides which act as fixing agents of the phosphoric acid that may be added on soils as manure, under the form of super-phosphate of lime, or similar compounds. The researches of P. Thénard, Way, and Voelcker, point to the interesting fact that some of the most apparently useless elements in soils, such as alumina, oxide of iron, &c., are in reality the most useful, for although they do not take an active part in promoting vegetation, still they are the medium by which essential substances, such as fuming acid, phosphoric acid, potash, and ammonia, are retained and stored in soils until required to promote growth and vegetation.

Before drawing your attention to a few of the substances that a soil should contain, not only to enable it to support vegetation but to promote it in a high degree, I deem it my duty first to give here a few tables which shall give you an idea of the various mineral matters which chemists have found to exist more or less abundantly in vegetables, and which are found to compose the ashes left by vegetable matters when incinerated. The first table gives the amount of mineral matters in a

thousand parts of many of our ordinary agricultural products:—

MINERAL MATTERS IN PLANTS IN 1,000 PARS

Wheat, about	30
Barley	30
Oats	40
Rye	20
Maize	15
Beans	30
Peas	30
Potatoes	8 to 15
Turnips	5 to 8
Carrots	15 to 20
Wheat straw	50
Barley straw	50
Oat straw	60
Rye straw	40
Meadow hay	50 to 100
Clover hay	90
Ryegrass hay	95

The second table gives you an outline of the relative proportions of some of the most important mineral substances existing, in the ashes of several of the common cereals and roots cultivated by our farmers:—

MINERAL MATTERS IN PLANTS.

	Wheat.	Barley.	Oats.	Rye.	Potatoes.
Potash	237	186	269	220	567
Soda	91	81	—	116	18
Lime	28	26	60	49	20
Magnesia	120	75	100	103	52
Oxide of iron	7	15	4	13	5
Phosphoric acid	500	390	438	495	125
Sulphuric acid	8	1	105	9	136
Silica	12	273	27	4	42
Chlorine	—	traces.	5	—	42
	998	997	999	1,000	997

These tables naturally point out the great variety of mineral matters that enter into the composition of the ashes of plants, and also will familiarise your minds with the important relations which some of these minerals bear to the growth of plants which contain them. But before advertent to the part which some of these minerals bear in vegetation, it is desirable that I should refer to the relative quantities of mineral matters taken from the soil where they are grown, in what is called by farmers the rotation of crops.

ROTATION OF CROPS.—QUANTITY OF PRODUCE REMOVED FROM ONE ACRE OF GROUND.

		Be.
1st year—Turnips ..	{ Bulbs	51,000
	{ Tops	14,000
2nd " —Barley	{ Grain	2,115
	{ Straw	2,042
3rd " { Clover		2,130
	{ Ryegrass	2,130
4th " —Wheat	{ Grain	950
	{ Straw	3,550
		11,535
Moisture	19,380	
Mineral	1,284	
		20,514
Organic		67,225

Although these tables illustrate the quantity of mineral matters, their variety, and relative proportions existing in plants, and lastly the total amount of the various minerals which a rotation of crops removes from the soil, still they do not point out to you which are

most essential to vegetation. Perhaps the word "essential" which I have just used, is not correct, for all the mineral matters found in a plant must be essential to its existence and to its growth; but some of these minerals exist, generally speaking, in soils, and that in sufficient quantities for the wholesome growth of the plant; others are in minute quantities, and they are soon removed by successive crops, and if the mineral elements which compose bat soil, cannot by their decay or chemical decomposition be free, or bring into fit condition for the coming crop, these peculiar, rare, and still essential elements of vegetation, the soil will not reproduce the crops which require or their production those peculiar mineral substances. For example, a sufficient quantity of phosphates for turnips, or a sufficient quantity of potash for mangolds, or a sufficient quantity of silicates and phosphates for wheat and other graminous plants. It, therefore, becomes necessary that I should dwell for a few minutes on some of the most important mineral substances that should exist in the soil or peculiar crops, or should be added to it as a manure if bat soil is not exhausted of those treasures of vegetation.

The first substance belonging to this class to which I desire to draw your attention is phosphorus. It is only within the last fifteen or twenty years that the importance of phosphorus to vegetation has been demonstrated. Although experience had led certain farmers to the knowledge that phosphates—for example, ground bones—would promote the growth of meadow lands, still the honour is due to Liebig not only of having pointed out but proved the importance of phosphorus, or rather of phosphates, as essential elements of the rapid growth of plants, and specially of roots, for he was the first to call the attention of the agricultural world to the benefits to be derived, if, instead of using phosphate of lime in its insoluble state as it exists in bones,* it was added to soils either in a soluble condition, or in one which might easily become so under the influence of certain agents to which I shall hereafter refer. It is since the publication of his ideas that we have had the researches of Boussingault, Lawes, Dr. Gilbert, Dr. Voelcker, and Ville, who have shown on the one hand the importance of phosphates to vegetation, and on the other he extremely small quantities which exist naturally in soils; for chemists have been able to discover only traces of phosphoric acid in ordinarily cultivated soils, and these minute quantities had been traced as existing in primitive rocks forming those soils; and, although I am quite ready to admit that agricultural chemistry is still in its infancy, and can at the present time give only here and there useful information to the farmer, or insights into certain phenomena which take place in agriculture, still it cannot be denied that when we consider that it is only within the last twenty or thirty years that chemistry has really attempted to unravel the mysteries attending vegetation, and also to give a clear and scientific explanation of facts which hundreds of years have revealed to man, we cannot deny that in pursuing the same course for a hundred years, most invaluable and enlightened information will be thrown upon agriculture, and instead of being the result of mere experience, which often leads to failures, the farmer will base his operations on sound and scientific principles, which will enable him to obtain from his land the full yield it is capable of producing. The best proof of the correctness of this statement is that in England, where

chemical agriculture has made the greatest advance, farmers as a rule have ceased to allow the land to lie fallow—an operation which had for its object to allow the atmosphere to act upon the mineral elements of the land, so as to modify them in such a way as to liberate some of the scarce and still essential elements of vegetation, such as potash and phosphoric acid. In fact, so true is the rapid removal of phosphoric acid from what we call fertile land and its importance to the successful rotation of crops now adopted by most of the intelligent farmers of this country, that not only are bones imported from Australia, South America, and the Continent, but even minerals, such as apatite, are imported from Norway, and phosphorite from Estremadura, in Spain, and also under the form of semi-fossilized guano, under the names of Lambro and Kooria Moorla guanos. But even these abundant sources of phosphoric acid do not appear to be sufficient to supply the large demand that there is at the present day for phosphates or super-phosphates for agricultural purposes, for large quantities of fossilized coprolites abundantly found in Cambridgeshire, Suffolk, and Bedfordshire are used especially under the name of super-phosphate of lime. As to the mode in which they are treated to produce the valuable agricultural manure (super-phosphate of lime) I must refer you to the first lecture which I had the honour to deliver before you last year, in which also you will find the proportions of such super-phosphates of lime, the average composition of which I shall take the liberty of repeating here:—

Soluble phosphate	22	to	25	per cent.
Insoluble "	8	"	10	"
Water	10	"	12	"
Sulphate of lime	35	"	45	"
Organic matter	12	"	15	"
Nitrogen 0.75 to 1.5 per cent.				

Although super-phosphate of lime is a soluble salt when added by the farmer on the surface of his land either dissolved in water or in the state of a powder, still this solubility must rapidly disappear when in contact with the soil, for the soluble phosphate of lime is due to the excess of phosphoric acid which it contains, and the excess disappears when in contact with the soil as it meets, generally speaking, carbonate of lime or of magnesia, or oxide of iron which neutralises the excess of acid, rendering thereby the remaining portions of phosphate of lime insoluble. It, therefore, becomes interesting to inquire how an insoluble substance becomes soluble to render it fit to be absorbed by the spongioles or the roots of plants so as to convey it into the plants themselves. This is effected by carbonic acid gas dissolved in water which penetrates into soils, or by the fuming acid discovered in soils by Thenard, or by a non-neutral substance, similar in its composition to sugar, which has also the power of rendering soluble the insoluble phosphates existing naturally in the soil or added to it by the hand of man.

Dr. Voelcker published in 1863, in the Memoirs of the Royal Agricultural Society, a most valuable paper on the absorption of phosphate of lime and phosphatic manures by root crops. Among the many facts which had a direct interest for those employed in the cultivation of the soil, there is one point connected with these researches to which I desire to call your attention, and that is the relative amount of phosphoric acid which is required by an average crop of wheat or of turnips per acre. You may observe in reading over the following table that whilst turnips require 89½ lbs. of phosphoric acid, wheat, which is considered a highly nitrogenated crop, only contains 25½ lbs. of the same substance. This statement is correct so long as you take the total weight of the crop produced by an acre of land, for one acre of land will produce 20 tons of turnips and about two tons of wheat; but if you take 100 lbs. of each of these substances, then, of course, wheat will contain a far larger proportion of phosphoric acid than the turnips:—

* The general composition of bones may be considered to be as follows:—

BONES.				
Organic Substances.	Blood-vessels...	1
	Ossine	82
	Fatty matters	9
	Water	8
Mineral Substances.	Phosphate of lime	38
	Phosphate of magnesia	2
	Carbonate of lime	8
	Divers salts	2

ONE ACRE OF LAND.

	20 TONS OF TURNIPS.		WHEAT.	
	Bulbs.	Tops.	Grain. 1,920 lbs.	Straw. 3,840 lbs.
Potash	132	45.5	9.75	25
Soda	6.25	7	—	—
Magnesia	6.25	2.25	3.75	3.75
Lime	36	68.5	1	10.5
Phosphoric acid	28.25	11.5	16.25	9.5
Sulphuric acid	36	25	25	5.25
Silica	8	2.25	1	128.75
Chloride of sodium ...	19	18.25	} .5	9.25
Chloride of potassium ...	—	11.5		
Carbonic acid	47.25	36.25	—	—
	314.00	228.00	32.5	192.00

The researches of Mr. Lawes and Dr. Gilbert have demonstrated thoroughly the truth that the employment of super-phosphate of lime as a manure is useful for promoting the growth of wheat, and is essential to the perfect success of a crop of turnips. M. Ville has also published important papers in the "Comptes Rendus of the Academy in Paris," on "The influence of phosphates on vegetation;" and the following table will, I hope, convince you of the marked influence which they exercise on vegetation:—

INFLUENCE OF PHOSPHATES ON VEGETATION.

Phosphate of lime }	20.86
Alkaline silicates }	
Phosphate of lime	18.80
Earths and alkaline silicates	0.60
Earths	1.84

But the most interesting data at which M. Ville has arrived consist in that the presence of phosphates in soils determines a corresponding absorption of nitrogenated compounds by the plant; that is to say, that if phosphates are supplied to a vegetable, its growth will be partial; and if, on the other hand, ammoniacal salts or nitrates are supplied to it the growth will be imperfect; but if both of them be added to the soil, the absorption of the phosphate will be increased as well as that of the ammonia. This result is most interesting, not only in an agricultural point of view, but also as a physiological fact, for, until this important observation of M. Ville, scientific men had merely studied the immediate influence or absorption which the substance had on the vegetable or animal, without taking into account how these phenomena might be modified by the presence of others. I look upon the observation of M. Ville as one which will ultimately be far more appreciated than it appears to have been, and one which will lead to most important results in animal physiology and agriculture. I shall conclude these observations by giving you a table published by M. Ville, and which clearly sets forth the truth of these remarks:—

AMOUNT OF NITROGEN FIXED BY WHEAT UNDER THE INFLUENCE OF THE FOLLOWING SALTS:—

	Without Nitrogenated compounds.	With Nitrogenated compounds.
Phosphate of Lime and } ...	8.15	20.08
Alkaline Silicate }		
Phosphate of Lime	7.25	19.17
Earths and Alkaline Silicates	5.71	11.16
Earth	3.00	9.50

The extraordinary liberality with which the Emperor of the French has supported and encouraged all scientific researches or inventions which might tend to promote the welfare of his subjects, is exemplified in the case of

M. Ville, for the Emperor has not only built a special laboratory for his use, and placed a large greenhouse and other means of investigation at his disposal, but has allowed him to experiment on one of his private farms. And this encouragement has not been lost, for M. Ville has arrived at some very valuable and practical results. Admitting that he wishes to ascertain what the soil is deficient in, so as to produce a full crop, he divides an acre of land into four parts—adds to one portion superphosphate of lime; to another portion carbonate of potash; to another portion caustic lime; and lastly, nitrate of soda. He then places on these sections of the acre the various crops which are intended to be grown, and he soon finds out which of the four manures should be added to convert an ordinary yielding field into an abundant one. This simple and practical mode of proceeding has led him to use, as a general manure, which he calls mineral manure, the following substances:—Phosphate of lime 4 parts; carbonate of potash, 4 parts; caustic lime, 1/2 parts; and nitrate of soda, 6.5 parts. The results have been most satisfactory, and among the many he has published during the last two or three years I shall simply give the following:—

TOTAL CORN PER ACRE.

Unmanured	990	995
Mixed mineral manure	1192	987
Ammonia salts	1471	1518
Mixed mineral manures and } Ammonia salts	2407	2235

STRAW AND CHAFF PER ACRE.

Unmanured	1625	1430
Mixed mineral manure	1804	1538
Ammonia salts	2536	2706
Mixed mineral manure and } Ammonia salts	4176	4016

Allow me to pass from these highly-interesting and practical results obtained by M. Ville to those not less valuable published by Dr. Voelcker on another mineral matter which, like phosphoric acid, is only found in small quantities as a natural product in soils, and which, if absent, like phosphoric acid, renders the soil unprofitable to the farmer. That substance is potash. Dr. Voelcker has not only studied the action of one compound of potassium, say the caustic or carbonate of potash, but he has examined the action of these and also of sulphate of potash, chloride of potassium, and nitrate of potash, and to enable him to arrive at the correct result he had compared the action of these different salts of potash on various classes of soils, namely, calcareous stiff clay, fertile sandy loam, pasture land, marly soil, and sterile sand; and he has come to the general conclusion that when salts of potash are added to these soils, although the quantity retained by them varies with the nature of the compound of potassium used or the nature of the soil operated upon, still the soil will retain the potash and not allow it to pass off in the water which may issue from it by drainage or otherwise. If he employs a salt of potash, say the nitrate, sulphate, or chloride, the sulphate acid, the nitric acid, or the chlorine will combine with the lime or the magnesia, and even in some instances with the ammonia which the soil may contain, while the potash will substitute itself to either of these bases which were in the silicate, demonstrated to exist in soils by Professor Way.

As mankind increase on the surface of the globe, and their wants proportionately become greater, so by a marvellous and admirable dispensation of Providence, the power of the production of the soil to meet the wants of man is developed. A striking instance of this is given in the application of chemical discoveries to the cultivation of the land to make it commensurate with the growing requirements of the people. Thus, for example, we find stored in various parts of England—Suffolk, Cambridgeshire, and Bedfordshire—large beds of coprolites, or the

refuse of antediluvian animals buried there for thousands of years, unknown to man, and its value unappreciated. Further, chemists have discovered in Norway mountains of phosphate, under the form of apatite, and tracts of and of phosphorite in Estremadura in Spain. The same remarks apply with equal force and truth to salts of potash. Their supply up to the present time has been limited, as I stated to you in my last lecture, in speaking of the discoveries of M. Ballard, whose name I mentioned with no undue praise, as showing the benefits which society may derive from the extraction of a double chloride of potassium and magnesium from the ocean. Strange to say, within the last few years this identical salt has been discovered in large quantities as a mineral at Stassfurth, in Saxony, and although this mineral exists as a stratum under beds of ordinary common salt, and its discovery dates only three years back, there are at the present time 14,000 men employed in the factories which have risen on the spot for the extraction of the salt from its mineral, and its conversion into the various products required by the trade. This mineral, which has been called carnallit, and which assumes a thickness of 1,000, is composed in 100 parts, as follows:—Chloride of magnesium, 31.46; chloride of potassium, 24.24; chloride of sodium, 5.10; chloride of calcium, 2.62; salt of lime, 0.84; oxide of iron, 0.14; and water, 35.37. It may be considered as a definite chemical compound of 1 equivalent of chloride of potassium; 2 equivalents of chloride of magnesium; and 12 of water. I have not the slightest doubt that when this important discovery becomes generally known to our salt manufacturers, they will also turn their attention to the nature of the minerals composing the sub-soils of their salt beds, and will discover carnallit, and thus confer on the country a great boon by promoting its agriculture. The popularising of this fact may confer a great benefit on those salt-mine proprietors who are working their mines for rock salt, and who have not filled their mines with water, so as to take from them a brine containing the salt they require. I have no doubt that if carnallit is discovered in England, it will in many instances modify entirely the present method of working salt mines.

LIME.—Too much importance cannot be attached to the presence in certain proportions of lime in soils, for it is one of the essential elements of ashes of plants, and is necessary to their growth. In fact, Dr. Voelcker says:—

“We know practically how essential the presence of lime is for the healthy growth of every kind of cultivated produce. On soils very deficient in lime, most crops, especially green crops, are subject to all kinds of disease; and, consequently, roots fail altogether on such land, even if it has been liberally manured with good yard dung or guano. Up to a certain stage, corn and roots grown under such conditions appear to thrive well, but as the season advances they sustain a check, and at harvest time yield a miserable return. The remedy for such failures, which are not at all uncommon in localities where poor sandy soils prevail, is a good dose of lime or marl, and then, and only then, farmyard manure or guano may be applied to the greatest advantage. Marl or lime alone does not suffice for meeting all the requirements of our cultivated crops on such poor sands, and though calcareous minerals supply a most necessary element of plant-food, and by acting on the latent stores of food in the soil, produce at first a most strikingly favourable effect upon vegetation, they soon fail to produce the desired effect if repeated too often, to the exclusion of other fertilising matters. On the other hand, the most liberal application of farmyard manure of the best quality never produces so beneficial and lasting an effect on poor sandy soils as when they have been previously well marled or limed. On such land no doubt the proverb holds good:

“Lime and marl without manure
Only make the farmer poor.”

“But at the same time I have a strong impression that

on such land manure, without lime or marl, does not help much towards paying the rent. There are some soils which swallow up manure, with, so to speak, an insatiable appetite, without ever feeling the better for the manure; they are appropriately called very hungry. On all such soils I have no hesitation in saying much manure is wasted, or the most is not made of it, if previously to the application of farmyard-manure, guano, &c., the land has not received a good dose of marl or lime.

“My recent filtration experiments point out the reason why marl or lime is peculiarly valuable on poor sands. It is not merely by supplying in a direct manner a deficient element of nutrition that lime acts so beneficially on such soils, but because it preserves in the soil the more valuable fertilizing matters, which, like salts of potash or ammonia, rapidly filter through sandy soils, unless a sufficient quantity of marl or lime has been previously applied to the land. By these means the bases of the more valuable saline soluble constituents of rotten dung or of guano are retained in the soil, whilst the acids filter through it in combination with lime, a constituent which is, comparatively speaking, inexpensive.”

The evening is too far spent for me to attempt to enter into the valuable researches of Mr. Lawes and Dr. Gilbert connected with meadow lands and the feeding of cattle; but I would strongly recommend those who take an interest in these branches of science to consult the papers published by those gentlemen in the *Journal of the Royal Agricultural Society*. I would also call your attention to a paper on the same subject by Mr. John Coleman, as well as a talented lecture which that gentleman delivered a few weeks since before this Society, in which he gives most important information to the farmer respecting the cheap feeding of cattle.

I hope, ladies and gentlemen, that you are now convinced of the truth of the assertion which I made at the beginning of this lecture, that no country possesses men better informed than those who exist in England on scientific agriculture. In fact, we can boast, especially if we give the lead to Scotch farmers, of being the leading nation in point of agricultural progress.

LECTURE V.

DELIVERED ON TUESDAY, THE 9TH MAY, 1865.

On the Discoveries in the Chemistry of Rocks and Minerals.

Although the title of this lecture appears to have some reference to the lectures recently delivered by my learned predecessor, Professor Ansted, still the study of geology and mineralogy is so vast that different men may lecture on them without interfering with one another's views, or in the slightest degree with the special branch of that science that each one has chosen for his discourse.

The first subject to which I should wish to draw your attention is the origin of colour in minerals. Up to a very recent period it was generally believed that their colour was due to a minute quantity of certain metallic oxides diffused through the mass; thus the red colour of the garnet was attributed to sesquioxide of iron; ultramarine to oxide of cobalt; emerald to sesquioxide of chromium; and amethyst to oxide of manganese.

The first researches which were published, according to my knowledge, on the fact that organic matters might exist in minerals, are due to Sir David Brewster, who discovered in one of the most compact and hard minerals known, viz., topaz, exceedingly volatile hydrocarbons, which were so volatile that the simple heat of the hand, when brought to bear upon this mineral, proved sufficient to transform them into gaseous matters, which would recondense on the hand being removed. Sir David Brewster ascertained that the fluids were confined in small apertures, or cells, existing in the mineral, and calculated there were 8,000 cavities in one-seventh of an inch of topaz. In 1857 Lewy ascertained that the green colour of

the emeralds of Muso, New Grenada, was not due to sesquioxide of chromium but to an organic substance, for not only did they yield water and carbonic acid when heated in a close vessel, but on calcining a small quantity of the mineral it became colourless, and did not again resume its primitive colour, which probably would have been the case if the colour of the mineral had been due to sesquioxide of chromium. Notwithstanding this, Mitscherlich and Rosé published, in 1864, a paper in which they showed that the colour of a certain class of emeralds was due in their opinion to the presence of this oxide.

Knox also demonstrated the fact that smoked quartz became colourless when heated; and Kuhlmann, in researches recently published, has shown that smoked quartz will lose its colour under the influence of heat, and that the bluish black colour of flint may be traced to the same cause.

Wolf proved some time since that the various colours which fluor-spar assumes are also due to organic substances; and his researches leave no doubt that the colour of green fluor-spar can be traced to a hydro-carbon. But one of the most interesting papers published of late on this subject is that of Professor Fournet, of Lyons, in which he shows that the reddish, yellowish, or greenish colour which some clays assume is not due, as was formerly believed, to metallic oxides, but may clearly be traced, in many instances, to the presence of organic substances.

Amongst numerous instances that he cites in his memoirs, the most curious one is the molecular change of certain clays into a mineral called jasper, "a double silicate of alumina and protoxide of iron," and which conversion could not be attributed to the action of heat, but to the slow dehydration of the clay and to pressure, for he was able to trace in those splendid veins of jasper existing in the province of Constantine, Algeria, the gradual passage of certain beds of clay into corresponding ones of jasper, and this mineral as well as the clay from which it was produced, became not only colourless under the influence of heat, but gave off vapours which had a strong empyreumatic or organic odour. Mr. F. Kuhlman, whose name I have often had the pleasure of citing in this course of lectures, has published of late in the *Comptes Rendus* of the Academy of Sciences of Paris, several papers on the interesting subject as to what the colouration of minerals is attributable to, and this gentleman has not only proved that in many instances the colouration of certain minerals and gems may be traced to the presence of organic matters, but he has succeeded in colouring certain colourless minerals; thus, for example, by plunging into melted pitch topaz, rock-crystal, and opal, and allowing a sufficient quantity of pitch to penetrate, he has given a yellow colour to the topaz and opal, and transformed white rock crystal into the smoky variety. This fact is not only interesting to a geologist, but must prove so to every reflecting mind, for it is difficult to conceive how substances so hard and compact can prove sufficiently porous to admit the vapours of volatile bodies. His researches have also for chemists a marked interest, for he has made the following curious observation, viz., that if he took plaster of Paris, mixed with a sufficient proportion of water to convert it into a solid mass (the composition of which is equal to SO_3 , $\text{CaO} + 2\text{HO}$, or sulphate of lime, with two equivalents of water), and plunged it into a bath of melted pitch, the two equivalents of water would be replaced by an equal weight of pitch, converting the whole into a solid mass susceptible of taking a high polish, and therefore applicable to many ornamental purposes. He also proposes what I believe has been in practice now in England for some time, viz., dipping bricks, and other building materials, into melted pitch, and cementing them with that substance in all cases where an impermeable wall or surface is required.

Without entering into the numerous applications of Mr. Kuhlmann's researches, I cannot part with them without

citing a simple method which he proposes to determine whether the colouration of a mineral or a gem is due to an organic or to an inorganic substance. To effect this he places a small quantity of the mineral in a small platinum tube, and passes over it hydrofluoric acid, which does not affect the colour of the gem if it is due to an organic substance, for example, those of the amethyst, ruby, black diamond, or yellow quartz, but discolours at once certain stones, their colouring substance being sesquioxide of iron or a silicate of it.

Allow me to mention a most interesting, and as yet little known, class of minerals, the composition of which is not only interesting to chemists but also to astronomers, mineralogists, and natural philosophers. I mean aerolites. Notwithstanding the careful analyses that have been made of these meteoric stones, the presence of no new metal has been discovered in them, or of any which chemists have not found upon our own planet; but they have been able to ascertain that some of these aerolites contain, or are composed in some instances of, metals in a native state, which are never found in that condition upon our planet; thus it has been proved that some of them contain metallic nickel, cobalt, and even iron; in fact, in some instances, the volume of some of these aerolites that have fallen on our planet, which are composed of iron, has been sufficient to allow a man to work them directly into implements; such was the case with an aerolite found in Mexico, which had the following composition:—

Iron	96.50
Nickel	3.50
	100.00

What in a scientific point of view enhances the value of this peculiar class of meteoric stones, is the presence of some of them of a peculiar yellow mineral, having a great resemblance to pyrites, but still differing entirely from it in composition, as proved by the analysis of Mr. Lawrence Smyth, who found it to be composed of four equivalents of iron, two equivalents of nickel, and one equivalent of phosphorus, and to it he gave the name of "schreibersite." It has lately been artificially produced by Mr. Faye, under the able guidance of Henry St. Clair Deville, by melting together in a crucible a mixture of oxides of iron and nickel, phosphate of soda, silica, and charcoal, allowing the whole to cool, when in the fused mass were found well-defined crystals, having a yellow colour, and identical in composition to the "schreibersite" analysed by Mr. Lawrence Smyth—a triumph of science for it is the first example of the artificial production of a mineral substance found in an aerolite. The presence of a large proportion of metallic iron, and especially of phosphorus, in this class of aerolites, proves that they may have a cosmical origin, and that they must have been formed, or rather the mass from which they have been detached, must have been produced and existed where there was no atmosphere similar to that which surrounds our planet, viz., one containing oxygen. What tends to confirm this view is that many of the meteoric stones analysed by chemists contain a large quantity of carbonaceous matters. The most complete analysis of this class of meteoric stones is that made by Mr. Cloez of France, and which drew the attention of many scientific men at the time, owing to its fall being clearly traced, and specimens carefully secured; it had the following composition:—

COMPOSITION OF THE ORGUEIL AEROLITE.

Hygrometric water.....	5.975
Silicic acid	24.475
Sulphuric acid	2.195
Sulphur	4.369
Chlorine	0.073
Phosphorus	traces
Alumina	1.175

Oxide of chromium.....	0-025
Peroxide of iron	13-824
Protoxide of iron	17-924
Oxide of nickel	2-450
Oxide of cobalt	0-085
Oxide of manganese	1-805
Magnesia	8-163
Lime.....	2-183
Soda.....	1-244
Potash.....	0-307
Ammonia.....	0-098
Hydmin	6-027
Combined water	7-345

96-442

This analysis of Mr. Cloez is not only interesting as showing the numerous substances which enter into the composition of one of these meteoric stones, but especially owing to the fact that he demonstrated in it the presence of an organic substance similar to coal, and also water. Chemists have also ascertained that many meteoric stones are highly siliceous, or composed almost entirely of silica and silicates of various metals. Mr. Charles Sorby, of the Royal Society, has recently published, in the *Proceedings* of that Society, some interesting papers on the microscopic differences which exist between the general texture or appearance presented by meteoric stones and the lava of volcanoes; also between the native meteoric iron and the commercial kinds. There can be no doubt that these researches will throw much light on the circumstances that have attended the formation of aerolites in general. In all events there can be no doubt that fire-balls, falling stars, and meteoric stones have a cosmical origin, and that they fall on the surface of our planet whenever they come within the earth's attraction, or that this force overpowers that of the sun. It is easy to explain, knowing, as we now do, their composition, why they appear luminous when they arrive near the earth's surface, or they have to traverse an oxidising atmosphere, or one containing oxygen, and as they travel through the space heat is generated by the friction of the particles composing them with those of the atmosphere, and the heat thus produced becomes sufficient for the combustible matters which enter into their composition, viz., carbon, iron, nickel, &c., being burnt or oxidised by the oxygen of the atmosphere. It is the knowledge of this fact which, no doubt, as suggested to Professor William Thomson his theory—that the high temperature of the sun is due to, and maintained by, the heat generated by cosmical matter falling on its surface, as I had the pleasure of explaining to you more fully in my first lecture.

I shall now examine with you the artificial formation of certain minerals and gems. Some of the earliest and most successful attempts in this line of researches are those of that talented chemist, Abelman, who made the curious observation that certain bodies or compounds, which chemists had considered as fixed or non-volatile, were susceptible of being volatilized if they were kept at a very high temperature for a long period, and also that bodies might be made to combine together and form certain minerals which existed already in nature. The volatile and volatile substance which he especially used was boric acid; thus he mixed with a large quantity of this substance small amounts, but in equivalent proportions, of alumina and magnesia, and introduced the whole into a crucible which was placed in a porcelain kiln, and submitted to an intense heat for several days, when the greatest part of the boric acid was volatilized; on allowing the fused mass to cool, well-defined crystals were found which, on examination, proved to be identical with the mineral called spinelle ruby, and by substituting the earth called glucina for magnesia, he obtained another gem called "cymosplane." Without adverting to the various minerals and gems that he produced, I may state that his researches attracted much attention at the time they were published.

M. Daubray has also succeeded in producing artificially various minerals by submitting, in a boiler containing water, divers amorphous mineral matters to an extremely high pressure, and consequently to a comparatively elevated temperature, thus converting them into crystalline ones. By this means he succeeded in producing, among other minerals, crystallised quartz.

But certainly the most interesting papers that have been published in this line of investigation are those due to a gentleman whose name I have often cited in these lectures, I mean Henry St. Claire Deville. This gentleman has succeeded in converting amorphous bodies into well-known crystalline minerals by submitting them to the influence of minute quantities of another substance, under circumstances quite novel in themselves; and what enhances the value of his researches is, that the methods he has employed are similar to those which must have taken place in nature, and also the fact that the substance which he has employed to effect the change of an amorphous substance into a crystalline one, does not itself undergo any molecular change or decomposition. For example, he has transformed the red, amorphous, sesquioxide of iron into the crystalline variety called "oligiste iron ore," identical with that found in the Isle of Elba, or into specular iron ore, similar to that observed in the craters of volcanoes. To obtain these results he places the sesquioxide of iron in a porcelain tube, and whilst the whole is heated to dull redness, he passes over it a slow current of hydrochloric acid gas. This result explains how specular iron is found in volcanoes, for his brother and Dr. Daubray have proved the existence of hydrochloric acid among the gaseous products escaping from these great natural furnaces, in which violent chemical reactions take place. Mr. H. Deville has also succeeded in converting a mixture of sesquioxide of iron and magnesia by means of a small quantity of hydrochloric acid or what he calls his "mineralisator," into a substance called "periclase," also found on Mount Vesuvius. These results are certainly extraordinary in a chemical point of view, if we remember with what facility these oxides dissolve in hydrochloric acid when brought into contact with an excess of that gas, even when operating under the circumstances in which he did, or when these oxides are placed in contact with a solution of the same acid. Mr. H. Deville also succeeded in producing "Hausmannite," or the crystallized sesquioxide of manganese, by substituting this oxide for sesquioxide of iron in the tube in which he operated. He further observed that if he employed binoxide of manganese instead of sesquioxide of manganese, he obtained, strange to say, beautiful green crystals of protoxide of manganese. But, certainly, the most important result arrived at was the artificial formation of a mineral called "staurotide," a silicate of alumina, a mineral that exists abundantly in nature. To effect this he introduced into a porcelain tube, placed vertically, first, a layer of alumina, then a layer of silica, over this a layer of alumina, and again a layer of silica, and so on until he filled his tube, ending with silica; he then applied a gentle heat to the tube, and passed through it a slow current of fluoride of silicon, which, on coming in contact with the alumina, gave rise to silicate of alumina, and fluoride of aluminium, which, in its turn, coming in contact with silica gave rise again to silicate of alumina and fluoride of silicon, and this chemical reaction continued from layer to layer until the whole mass in the tube was transformed into "staurotide," the same mineralising substance escaping from the tube as had entered it, although during its passage it had converted the amorphous alumina and silica into the well defined mineral called "staurotide."

Mr. Deville calls the attention of mineralogists as well as chemists to the probability that such similar actions have no doubt taken place in nature, and so gives an easy explanation of many of the facts observed by geologists.

In conclusion, I may state that Messrs. Deville and Daubray have succeeded by the same method in producing anatase, rutile, and brookite.

Mr. Kuhlmann has also published in the *Comptes Rendus* of the Academy of Science of Paris, several papers on the artificial formation of minerals, and although I drew your attention on several occasions to instances of their being produced under what he calls the crystallogenic force, in my first lecture, still I cannot refrain from advertent to another example, viz., that if gummy matter be mixed with syrup of sugar, and the whole dried rather rapidly, an amorphous varnish is left, say on the surface of a glass plate, but if then it is exposed to a damp atmosphere, after a few days, the whole of the surface becomes covered with well-defined crystals of sugar.

Mr. Faraday and Mr. Becquerel, sen., published, many years ago, some valuable papers, in which they showed that, by submitting proper metallic solutions to the influence of slow currents of electricity, slowly but surely, well defined mineralogical specimens would be produced, such as gypsum, pyrites, blende, galena, and several metallic oxides.

These researches present a peculiar interest when we consider the formation of the metallic veins or lodes on our planet, the more so that Mr. Becquerel employed moistened clay to separate the two different fluids in his tubes, as a substitute for porous cells in ordinary galvanic batteries, thereby imitating nature in many instances where metallic lodes are found; thus in Cornwall, often a clay slate called killas is found to accompany or to line the lodes of tin and copper, which no doubt fulfils, as in the experiments of Mr. Becquerel, the functions which a porous cell does in ordinary batteries.

That electricity must play an important part in the formation of metallic veins or lodes, there can be no doubt, if we reflect on the advantage taken by telegraphic engineers of the earth as a conducting medium for the return current of electricity, for, as you are aware, there is no necessity to employ more than one wire, since the earth completes the circuit, thus dispensing with the use of a second one, as it brings back the current to the instrument from which it has been emitted.

Further, many practical mining engineers have observed that the veins or lodes of tin and copper run or strike in Cornwall in an easterly and westerly direction, whilst those of lead, called "cross-courses," have a bearing nearly at right angles. I am aware that there are exceptions to this rule, but they are rare. A further proof that natural electricity must play an important part in the formation of veins or lodes, is that the largest deposits are generally found near the junction of two veins. Also that metallic veins are generally mixed with mineral matters differing entirely in composition from the rocks in which they are imbedded; this mixture of minerals bears in Cornwall the name of "gossan;" thus, for copper ores, the mixture is more or less rich in ochre, friable quartz, &c., and this "gossan" plays such an important part in the formation of veins, that it is the surest guide that a Cornish miner can have to direct him towards the mineral lode he is seeking for. In the case of copper, this "gossan" is generally above the lode; in tin, generally below, although often stream tin or peroxide of tin is found in the "gossan" itself. For lead ores in Cornwall, the gang is generally a soft blue or dark clay-slate, containing large quantities of alumina and carbonate of lime. In Derbyshire and other parts the gang is generally heavy spar or sulphate of baryta. As to gold, its matrix is quartz, and in North Wales nearly all the veins run in the same direction, viz., from east to west; whilst the iron veins, especially those which are magnetic, run from north to south, and in some instances exactly in the direction of the magnetic poles.

Allow me to draw your attention for a few minutes to a most important discovery which has been made within the last few months, by Bunsen, Edmond Becquerel, and Marcus, of an unforeseen adaptation of terrestrial electricity which results from a slight change of temperature between the various geological beds composing the crust of our planet, and which has received the

name of thermo-electricity; up to this period it was admitted that all natural currents of electricity (dynamic electricity) on the surface of our planet were due to chemical action or molecular changes which were constantly taking place between the various mineral matters composing its surface.

Before attempting to impress your minds with the important part which thermo-electricity must play in the production of the natural electrical currents of the earth, and therefore in the formation of metallic lodes or veins, as above stated, it is necessary that I should say a few words on thermo-electricity itself. If two metallic bars be soldered together that they compose a closed circuit, more or less intense current will be produced as often as the temperature varies at the places of junction, the current continuing as long as the difference of temperature is maintained, and this fact can be easily demonstrated if a bar of bismuth and one of copper be soldered together, and their other ends be connected with a copper wire made to pass over a suspended magnetised needle. As long as the temperature of the junction remains unchanged, no current is produced, but as soon as any slight change of temperature occurs at the point of junction, a current of electricity is produced and the needle is deflected. All metals do not yield the same marked results as bismuth and copper, and investigations have shown that, as with dynamic electricity, metals have different degrees of conductivity; that some may be classed under the name of negative metals, whilst others may be ranged under the head of positive. The quantity of electricity produced by this means is exceedingly feeble, Nobili conceived the idea of soldering together a number of thermo-electric pairs of copper and bismuth, thus composing a thermo-electric battery, or pile, as Melloni further multiplied the intensity of these currents by an instrument which he called a "thermo-multiplier;" but, notwithstanding this the quantity of electricity produced by a change of temperature in this manner was so feeble that these currents were considered too insignificant to participate in any way in the production of the natural electricity which was known to exist.

In November last Professor Bunsen published in the "Annales de Poggendorf" a paper in which he showed that thermo-electricity was produced when blades of natural copper pyrites and of pyrolusite (a peroxide of manganese) were heated at their point of junction.

This publication induced Mr. Becquerel to publish a paper in the *Comptes Rendus* of the Academy of Science of Paris of last February, in which he showed that sulphur modified in a remarkable degree the thermo-electric power of metals; thus, that sulphide of bismuth was negative to bismuth itself; whilst proto-sulphide of copper was positive with respect to copper, and that the natural copper pyrites was negative to the same metal. Further he showed that a thermo-electric pair, composed of a bar of copper, and one of protosulphide of copper, would produce, when heated between 32° and 212°, a current ten times as strong as that which would be produced by heating between the same temperatures equal surfaces of copper and bismuth soldered together, and that a more powerful pile still could be produced by forming a pair of proto and bi-sulphides of copper.

Without entering here into the numerous experiments and deductions which Edmond Becquerel draws from his researches, let me at once call your attention to some of the valuable results obtained by S. Marcus, of Berlin, who has succeeded in constructing thermo-electrical batteries having a force far exceeding anything that could have been anticipated from thermo-electricity; thus he has constructed a battery of 25 elements capable of disengaging in one minute 25 cubic inches of hydrogen and oxygen, and melting a platinum wire 1 millimetre in diameter and placed in the circuit. A battery of 30 elements produces a quantity of electricity sufficient to communicate to an electro-magnet the power of sustaining a weight of 160 lbs.

Mr. Marcus arrives at these results by soldering together long bars of metallic alloys, composed as follows:—

For the positive metal:—

Copper	10 parts
Zinc	6 "
Nickel	6 "

For the negative metal:—

Antimony	12 parts
Zinc	5 "
Bismuth	1 "

These alloys not only give rise to most powerful thermo-electric currents when soldered together, and their point of junction heated, but they are preferable to copper and bismuth, owing to the fact that they undergo no change at a comparatively high temperature as copper does, and do not melt like bismuth. Further, he increased in a marked manner the power of his battery by plunging one end of his soldered bars into cold water whilst their other end was heated by a gas flame, and as no solder could be found capable of resisting such a high temperature, the two bars composing the elements of his battery were united by means of screws.

These facts, together with some others which you will find published in the *Philosophical Magazine* of this year, must give you some idea of the enormous quantity of electricity that must be produced in the crust of our planet by means of thermo-electricity, for we all know the large amount of sulphurets of various metals that enter into the composition of that crust, and there can be no doubt, from the facts above stated, that the electricity so produced must and does contribute, in a marked degree, to the formation of veins and lodes.

My wish was to have drawn your attention to the variety of gases which escape from the craters of volcanoes when in activity, as well as from the secondary outlets, called "fumerolles," as much information has been added to our knowledge on these phenomena of late years by M. Charles St. Claire Deville and M. Fouqué since the valuable researches of Professor Daubeny on these phenomena; still, I cannot refrain from calling your attention to several tables which I have hung round this room, and which illustrate the great variety of gases that escape from the crater, as well as from the fumerolles which surround it. From the crater escapes hydrochloric and sulphurous acid, volatile chlorides, and aqueous vapour; at a short distance from it hydrochloric acid appears to cease, and sulphurous acid to predominate; thus in 100 parts of gas he found—

Sulphurous acid.....	24.5
Oxygen	14.5
Nitrogen.....	61.0
	—100.0

At a further distance he found sulphuretted hydrogen and carbonic acid, varying from 0.8 per cent. to 28 per cent.; oxygen, 8.2 per cent.; and nitrogen, 90 per cent. In another case, 14.9 per cent. of oxygen, and 66.9 per cent. of nitrogen; and as he still proceeded further from the centre of activity, the sulphuretted hydrogen and sulphurous acid disappeared, and were replaced by carbonic acid, and lastly by a mixture of light carburetted hydrogen and carbonic acid, as this table illustrates:—

	Santa Venerina.	San Biagio.	Paterno.	Valice.	Girgenti.
Carbonic acid	3.18	74.99	95.35	93.49	1.65
Oxygen	1.18	2.78	0.58	0.68	0.69
Nitrogen	22.15	19.47	2.94	5.14	8.74
Carb. hydrogen ...	71.76	3.77	1.12	1.45	87.23
Hydrogen	8.70	0.99	0.50	0.43	5.74
Sulphuretted hydrogen	traces.

Proceedings of Institutions.

METROPOLITAN ADULT EDUCATION ASSOCIATION.—Evening classes for males and females have been organised in Holy Trinity Schools, Hoxton, under the presidency of the Rev. T. W. Fowle. A numerously attended public meeting was held on Oct. 31, in the school-rooms, when the class system and scheme of examinations promoted by the Association in connection with the Society of Arts were explained by the Rev. G. B. Macilwain, Hon. Sec., and Mr. H. H. Sales, Visiting Officer to the Society of Arts. There is good prospect of the newly formed classes forming the centre of other similar classes in the district.

Fine Arts.

HORACE VERNET'S TOMB.—M. Constant Dufeux has just completed the tomb of the painter, Horace Vernet, in *Pere la Chaise*. It consists of a large block of granite, without any ornament, upon which is placed a slab of white marble in the form of a Latin cross. The only emblems on the tomb are a drapery, studded with stars, which surmount the cross, and palette and brushes.

Commerce.

GREEN TEA.—Mons. Travers give the following account of the production of this kind of tea:—"Some, perhaps, of our readers may not be aware of the fact that the tea-shrub is a single species, and that from the same tree black or green tea might be made, indifferently; though for commercial purposes it has been found more convenient to confine the manufacture of particular teas to particular districts. The difference between the two, black and green, depends solely on the manipulation and the processes to which the leaves are subjected during the period of manufacture. In the case of the latter, those leaves which are intended to be converted into green teas are roasted almost immediately after they are gathered, and then quickly dried off after they have undergone the rolling process; the colour by this method becomes fixed, and there is no danger of any subsequent change. In the case of the black tea, the leaves are opened flat, and allowed to lie exposed for ten or twelve hours before being roasted; after roasting they are again exposed to the air in a soft and moist state, and finally they are dried slowly over charcoal fires. That this difference in colour is effected solely by the difference in manufacture is proved by subsequent observations made by Mr. Warrington at Apothecaries' Hall. Whilst engaged in the excitation of certain medicinal herbs, he found that the plants, but more especially those which were nitrogenous, brought from the country by the collectors, were on their first arrival of a bright green colour; but that when delayed too long on their journey, or confined for too long a period after being dried, they had entirely lost the bright green, and assumed a blackish-brown in its place. But it is not sufficient for the English consumer that the natural green only of the tea leaf should be there; the leaves before they are allowed to please the palate must pass the more exacting ordeal of the eye. They must be uniform in their appearance, and of a particular hue. As this effect can only be produced by the employment of colouring matter, a mixture compounded of gypsum and Prussian blue, is laid on the leaves, during the last process of roasting. This adulteration the Chinese do not hesitate to carry out on a systematic plan, and on a most extensive scale, and the practice, so far from diminishing, is even extending to the Northern parts of China. 'During this part of the operation,' says Mr. Fortune, in his description of the process, 'the hands of the workmen were quite blue. I could not help think-

ing that if any green tea drinkers had been present during the operation, their taste would have been corrected, and, I may be allowed to add, improved. It seems perfectly ridiculous that a civilised people should prefer these dyed teas to those of a natural green. No wonder that the Chinese consider the natives of the West to be a race of 'barbarians.' Mr. Fortune says that half-a-pound of paint or colouring material is mixed with each hundred pounds of green tea. The Chinese readily acknowledge the superiority of green, uncoloured, but plead in excuse for their adulterations the wilful preference of the foreigner; we need hardly add that they are far too sensible to touch these dyed teas themselves."

COTTON.—From letters recently read before the Executive Committee of the Cotton Supply Association, it appears that the planting of the cotton seed has been attended with complete success in Jamaica, Tobago, Upolu (Samoa), and King William's Town (South Africa), but the most remarkable proof of the success attending the efforts of the society to promote the growth of cotton is to be found in the fact that, from the accidental reception of a handful of Sea Island cotton seed in the year 1863, between thirty and forty acres in the neighbourhood of Naples are now planted with it, from which a crop of about 40,000 lbs. of seed-cotton, equivalent to a yield of 10,000 lbs. clean cotton, is expected this year. The handful of seed planted in 1863 produced about 80 lbs. of uncleaned; and with the seed of this quantity two acres and a-half were sown in 1864, which yielded a bale of 750 lbs. of clean cotton. At a time when New Orleans sold at 17d. per lb. and fair broach was worth 14d., this amount of Naples cotton realized as much as 29d. in Manchester. At Upolu, one of the Samoan group of islands, the Consul planted about seventy acres, and it was expected that there would be as many as 400 acres under cultivation before the close of the year. The whole of the Samoan islands are reported to be extremely suitable to the cultivation of cotton; but the implements in use there are of the rudest description, and the natives themselves are wanting in industry. Some New Orleans seed sent to Kurnaul, in the Madras Presidency, arrived too late in the season, so that the crop turned out a failure.

Colonies.

HOBART TOWN STATISTICS.—The estimated population of Tasmania on 31st December, 1864, was 93,307. The arrivals during the year are estimated at 3,711, and births 3,081; but from this must be deducted, departures 3,521, and deaths, 1,433—total, 4,954; leaving an increase on last year of 1,788. The births show a total increase of 83, and the deaths 15, on those of the previous year. The marriages registered were 698, precisely the same number as in 1863. During 1864, 118 immigrants were introduced—53 males and 65 females—the average cost to the colony per statute adult being £9 12s. 9d. Only 6 of the aboriginal inhabitants remain, 1 man and 5 women. They are located at Oyster Cove, and the cost of superintendence and maintenance last year was £522. The value of the imports and exports from Hobart Town was:—

	Imports.	Exports.
To United Kingdom	£252,590	£251,235
To British Colonies	296,425	255,606
	£549,015	£506,891

The value of imports and exports from Launceston was:—

	Imports.	Exports.
From United Kingdom	£95,696	£170,236
From British Colonies	263,554	297,603
	£363,250	£467,839

During the past year 140,108 acres of country lots were sold by the Crown for £108,250, an average of 15s. 6½d.

per acre. During the same period town and suburban allotments, comprising 1,273 acres, were sold for £134, being an average of £5 18s. 6d. per acre. The total number of acres in cultivation was 252,164, and 100 acres of new land were broken up during the year. This cultivated land, 60,186 acres were sown with wheat, yielding 839,501 bushels; 6,320 acres with barley, yielding 123,320 bushels; 40,987 acres with oats, yielding 995,382 bushels; 30,992 acres with colonial hay, yielding 35,210 tons; 127 acres with tobacco, yielding 242,775 lbs. 128,784 bushels of apples, and 13,840 bushels of pears were grown last year, against 168,114 of the former and 25,800 of the latter the previous year. The present stock of live stock is:—Horses, 22,000; horned cattle, 89,84; sheep, 1,736,540; goats, 2,393; mules and asses, 13; pigs, 50,880.

GRAVING DOCK FOR MELBOURNE.—The total length of this dock will be 250 ft., and breadth 94 ft. at the top and 50 ft. at bottom. The depth will be sufficient to allow of the entrance of vessels drawing 25 ft. of water, which will render the dock available for vessels of the largest size that visit Hobson's Bay. The total cost is estimated at £100,000. A fair beginning has thus been made towards the dry dock accommodation which has for years been the great drawback to the Port of Melbourne, vessels of large size if wanted to be overhauled or repaired having to go to Sydney.

TELEGRAPHING IN NEW ZEALAND.—An order has been sent to England for a supply of thirty or forty miles of cable for connecting the northern and middle islands. The route had been surveyed by Mr. Balfour, and the cable would cost altogether £20,000—£10,000 for the first cost, and £10,000 bringing it out, laying down, and other incidental expenses.

Publications Issued.

THE LIFE, TIMES, AND LABOURS OF THE MARQUIS OF WORCESTER, to which is added a reprint of the *COURT OF INVENTIONS*. By Henry Dircks. (*Quarterly*).—The origin of the steam-engine has never yet been satisfactorily elucidated. Many claimants have been put forth for the honour, and Mr. Dircks, in writing the life of the Marquis of Worcester, advocates his claims to be considered as the originator of that source of national power and wealth. Mr. Dircks has had placed at his disposal by the Duke of Beaufort, the present representative of the Marquis's family, a number of original manuscripts and documents not hitherto published.

HALF-HOURS OF FRENCH TRANSLATION. By Alphonse Mariette, M.A., Professor of the French Language and Literature at King's College, London. (*Williams and Norgate*).—The first part of this work consists of a well-chosen series of extracts from good English writers, very various in style, and in the form of idiom employed. The range of selection is over the whole of the wide field of English prose, between the essays of Lord Bacon and those of contemporary journalists. The choice of each extract has been founded not upon its merit more than its convertibility into French. Every passage may be so translated that a good translation shall seem to contain not the words only but the thoughts also, and some one of the moods of a Frenchman. In foot-notes, carefully appended to each passage, the labour of the pupil is lightened by the supply of fragments of translation where the two languages differ in idiom. In the second part of the book, Professor Mariette has translated from contemporary French authors choice illustrations of the French of to-day, and has so translated them that they may be a successful hand be faithfully turned into French. In the extracts from French writers there is the same regard paid to variety of tone; and the student who throughout the first part of the book is speaking the thoughts of his own land in the language of a neighbour, in the second part of

he book, when he does not mistranslate, is actually writing French thoughts in the Frenchman's way. A key to be above, by the same author, is also published.

Forthcoming Publications.

THE RECORD AND DESCRIPTIVE CATALOGUE OF THE DUBLIN INTERNATIONAL EXHIBITION OF 1865, by Henry Markinson, Secretary and Comptroller; and P. L. Simmonds, Colonial Superintendent. (*Dublin, John Falconer.*) This work will contain all the official documents, statistical data, and descriptive information of the rise, progress, and results of the exhibition and winter garden building; with details of the articles exhibited, and the advance made in Irish industries since 1853, and is published under the sanction of the Executive Committee, and dedicated to His Grace the Duke of Leinster, B. L. Guinness, Esq., M.P., and Gilbert Sanders, Esq.

Notes.

READING INDUSTRIAL EXHIBITION.—The Industrial Exhibition, and collection of fine art treasures from the mansions of Berkshire, held at the Town-hall, Reading, since the 13th of September, closed on Monday, the 30th October, when the medals and money prizes were distributed by the Right Hon. the Earl of Carnarvon. The undertaking has been carried out with spirit, and been attended with great success, nearly 70,000 persons having visited the exhibition, and the receipts amounting to £1,800. It is estimated that the expenditure will amount to £1,300, of which sum £300 were set aside for money prizes, medals, and certificates.

MIDDLE-CLASS EDUCATION IN THE CITY.—A proposal has been made by the Rev. William Rogers, M.A., rector of St. Botolph, Bishopsgate, a member of the Council of the Society of Arts, for an extension of the means of education in the city of London, so as to meet the confessed wants of a great class there who are at present without any public provision of the kind. The educational wants of the poor are met by the ward and other schools; but above these is a large middle-class, composed of tradesmen and people employed in the City, who cannot well send their children to the Ward or National Schools, and who are debarred by various circumstances from availing themselves of the great city schools. The recipients of the endowed charities in city parishes are yearly diminishing in number, but the funds are increasing. It is proposed that a combination of the parishes should be brought about, and from such surplus funds a system of education should be established for the children of parents who cannot afford to pay more than say £1 per quarter for their education. The contributing parishes to be represented upon the board of management of the schools, and the children of parents who either reside or are employed in such parishes to have a prior claim of admission to the advantages. It is thought that Finsbury would be a convenient and desirable situation for a school of this nature.

MUSICAL EDUCATION IN PARIS.—The municipal authorities of Paris have this month established courses of gratuitous instruction in singing in the municipal schools of eighteen of the arrondissements of the city, one, two, or three courses in each, making in all twenty-eight classes; no arrondissements only are now without gratuitous vocal instruction.

IMPROVED RAILWAY ACCOMMODATION.—A novelty has been introduced in the railway between St. Petersburg and Moscow; carriages, designated as *wagons hôtels*, containing a saloon, and also closets with comfortable beds, have been placed on the line by a speculator, who charges two roubles extra to each passenger who avails himself

of the new carriages, in addition to the ordinary passenger fare charged by the company.

CONSUMPTION OF ALIMENTARY MATTERS IN FRANCE.—M. Payen, the well-known chemist, gives the following statistics, which are said to be authentic. France consumes annually, in round numbers, about 700,000,000 gallons of milk, of which Paris takes nearly one-third; nearly 120,000 tons of cheese of all kinds, the share of Paris being only 5,000 tons; 290,000 tons of sugar, Paris consuming 20,000 tons; nearly 38,000 tons of coffee, Paris using 4,500 tons; 20,000,000 gallons of beer, of which Paris drinks an entire sixth. The total quantity of wine produced in France is set down at nearly 2 thousand millions of gallons, and valued at twenty-two millions sterling, or about fivepence per gallon.

Correspondent.

PASSAGE ACROSS LA MANCHE.—SIR,—Can anything be more barbarous and cruel than the arrangements which at present the public tolerate for crossing the 22 miles of sea between France and England? On both sides of the channel the railways afford comfortable shelter in stations and carriages, with rugs, and carpets, and *chauffe-pieds*; but as soon as you leave the carriages at the termini you are sent adrift in hail, rain, snow, and cold on the steamer, and are much less cared for than your baggage. If the day be wet—and throughout more than six months of the year this is the case—your feet are soaked through in descending the well-watered steps from Dover-pier to the steamer or across the pavement at Calais. When you arrive on board you have the choice between the cabin, detestably close and stinking, filled with human beings senselessly prostrate and sick, or the open deck, with the certainty of being soaked through by the rain and the spray washing over the boat, from the head of the vessel to the man at the wheel. There is no shelter whatever afforded by these little swift steamers, which rush through the water, and nothing can be had for covering except the stiff, rough, wet tarpaulin jackets of the sailors, which you don't get till you are already half-wetted through. It is persecuting enough to a hale man not given to sea-sickness, but to women and those who faint when descending to the cabin, the arrangements, or rather utter absence of arrangements, are cruel and excessively dangerous, especially for invalids. Can nothing be done in this age to ameliorate the sufferings of those dreadful two hours? To obtain a swift passage must, at least, an average of 200 persons every day in the year be thus persecuted? I don't believe it at all. It is not my province to suggest the remedies for obtaining shelter on the deck, which even the present boats might, I conceive, adopt. But here is a proposal, at least as a temporary palliative, until something better can be done. Let the railway companies offer to each passenger, at a proper charge, the use of a waterproof *capote*, covering the head and shoulders, a long, warm, cloth-lined macintosh-cloak—say about 7 ft. long—with a pair of waterproof over-boots, and an air cushion for sitting upon on the wet seats. They might be so made as effectually to keep the wearer dry from the rain and sea. They should be provided for the passenger either at starting or at the last station before crossing. If necessary, he might make a deposit for their value, which would be returned upon giving up the articles. It may be said every one can do this for himself. Certainly he could, and no doubt would if he had to cross frequently; but twice a year is as much as most travellers do, and they don't make special preparations. These articles would enable both women and men to stay on deck if they preferred it, and would prevent that soaking which afflicted my wife, two ladies, and your humble servant last week, entailing upon most of the parties colds and coughs which may chance to last all the winter, and largely increase the doctor's bill at Christmas. These

remarks apply equally to the passages to Ostend and elsewhere. The College of Physicians, the Institute of Civil Engineers, and the Society of Arts should all agitate respectively for some efficient remedies for the present state of things; and as Parliament descends to regulate London cabs, it might as well, perhaps, direct the Board of Trade to look to the small fry of sea steamers and their discomforts.—I am, Sir, yours, &c., **FELIX SUMMERLY.**

Oct. 26.

MEETINGS FOR THE ENSUING WEEK.

- Mon. ...** Medical, 8. General Meeting for Alteration and Revision of Laws. 1. Dr. Althaus, "On Degeneration of the Posterior Column of the Spinal Cord." 2. Mr. Leonard Clark, F.R.S., "On the same subject."
- Tues. ...** Ethnological, 8. 1. "Report on the Ethnological Papers read at the Meeting of the British Association in Birmingham." 2. Captain L. Wildman, R.N., "Notes on the Manners and Customs of the People about Little Popo, on Right of Benia." 3. Dr. Cullin, "On the Darian Indians."
- Wed. ...** Geological, 8. 1. Mr. R. A. C. Godwin-Austen, F.R.S., "On the Submarine Forest-beds in Porlock Bay." 2. Rev. B. Boag Watson, "On the Marine Origin of the Parallel Beds of Glen Roy."

Announcements by the Council.

NOTICE TO MEMBERS.

The One-Hundred-and-Twelfth Session of the Society will commence on Wednesday, the 15th inst., when the Opening Address will be delivered by WM. HAWES, Esq., F.G.S., Chairman of the Council.

The following are the dates of the Wednesday evening meetings, the chair being taken at Eight o'clock:—

1865. November	—	—	15	22	29
„ December	6	13	20	—	—
1866. January	—	—	17	24	31
„ February	7	14	21	28	—
„ March	7	14	21	—	—
„ April	4	11	18	25	—
„ May	2	9	16	23	30
„ June	—	—	—	27*	—

For the Meetings previous to Christmas, the following arrangements have been made:—

NOVEMBER 15.—*Chairman's Opening Address.*
NOVEMBER 22.—“On Water Supply, especially in Rural Parishes and Districts.” By J. BAILEY DENTON, Esq.

NOVEMBER 29.—“On the Proposed Purchase of Railways by the Government.” By WILLIAM HAWES, Esq., F.G.S.

DECEMBER 6.—“On the Graphotype, a Process for producing from Drawings, Blocks for Surface Printing.” By HENRY FITZ-COOK, Esq.

DECEMBER 13.—“On London Milk.” By J. CHALMERS MORTON, Esq.

DECEMBER 20.—“On Parkesine, its Composition, Manufacture, and Uses.” By OWEN ROWLAND, Esq.

The Cantor Lectures for the ensuing Session will consist of Three Courses, to be delivered by G. W. HASTINGS, Esq., LL.D., Barrister-at-law; FLEEMING JENKIN, Esq., F.R.S.; and Dr. F. CRACE CALVERT, F.R.S.

The following are the particulars of Mr. Hastings's course:—

LECTURE I.—MONDAY, NOVEMBER 27TH.—“The Effects of the Discovery of the Precious Metals on the Ancient Civilisation of the Mediterranean.”

LECTURE II.—MONDAY, DECEMBER 4TH.—“The Effects of the Discovery of the Precious Metals on Modern Civilisation.”

LECTURE III.—MONDAY, DECEMBER 11TH.—“On Copyright.”

LECTURE IV.—MONDAY, DECEMBER 18TH.—“On Limited Liability.”

The lectures will commence each evening at Eight o'clock.

These Lectures are open to Members, each of whom has the privilege of introducing one Friend to each Lecture.

Proceedings of the Society.

MUSICAL EDUCATION COMMITTEE.

The following are the prospectuses of the three chief Private Academies of Music in the Metropolis:—

THE NATIONAL COLLEGE OF MUSIC.

Temporary Office, 218, Piccadilly (two doors from the Regent-circus).

The College is founded with the design of enabling ladies and gentlemen to obtain a complete professional education on the system of the Continental *Conservatoires*, and to encourage the study of music more generally throughout the United Kingdom.

Although the scale of fees is very moderate, the Council have the power of assisting those showing remarkable talent, by granting a lower scale of payment, by the establishment of scholarships, and even by gratuitous instruction under peculiar circumstances.

Classes for amateurs will be organised in connection with the College, as the Council desire to place it in the power of everyone to receive the best instruction at a moderate expense.

Council.—Sir Reginald Barnewell, Bart.; Henry Brougham, Esq.; Lord Douglas; Viscount Dunlo; Lord Elphinstone; Paul Graham, Esq.; Viscount Hamilton,

* The Annual General Meeting: the Chair will be taken at Four o'clock. No Visitors are admitted to this Meeting.

M.P.; Sir Henry A. Hoare, Bart.; the Hon. Greville Howard; Lord Schomberg Kerr; Capt. Le Patourel; Rev. Sir F. A. Gore Ouseley, Bart. (Mus. Prof. Oxon); J. St. Aubyn, Esq., M.P.; Harry W. Scott, Esq.; A. Nowell Sherson, Esq.; Captain Gerard Smith (Scots Fusilier Guards); Capt. the Hon. Walter Trefusis; Rev. W. Crole Wyndham; and N. F. Zaba, Esq.

Treasurers.—The Marquis Townshend and the Hon. Seymour Egerton.

Trustees.—The Marquis Townshend, Lord Kingsale, and Rear-Admiral King, C.B.

Professors.—(Principal, Mr. Henry Leslie).—Composition—Mr. Benedict and Mr. Arthur Sullivan. Harmony—Mr. E. J. Hopkins and Mr. Franklin Tayler. Pianoforte—Mr. Benedict, Mr. Lindsay Sloper, Mr. Franklin Tayler, and Mr. J. G. Callcott. Singing—Mrs. Sims Reeves, Signor Pinsuti, Mr. Frank Mori, Mr. James Bennett, and Mr. Henry Regaldi. Violin—Herr Ludwig Strauss. Viola—Mr. Webb. Violoncello—Herr Daubert. Contra Basso—Mr. Howell. Flute—Mr. Sidney Pratten. Oboe—Mr. Alfred Nicholson. Clarinet—Mr. Lazarus. Bassoon—Mr. Waetzig. Horn—Mr. C. Harper. Trumpet and Cornet-à-Piston—Mr. Thomas Harper. Trombone—Mr. Winterbottom. Organ and Harmonium—Chevalier Lemmens. Concertina—Mr. J. C. Ward. Harp—Mr. Aptommas. Italian Language—Signor J. Popoli. Dictionnaire—Rev. W. W. Cazalet, M.A.

The students will be divided into two departments—ladies and gentlemen—and each department will be divided into two schools, "Upper and Lower." Fee for the "Upper" school, per term, £7; fee for the "Lower" school, per term, £5 5s.

Two scholarships (to be called the "Townshend" Scholarships) will be open to competition by all students of three terms; one of such scholarships to be given to the most deserving pupil in each school, who will thereby be entitled to a year's gratuitous instruction.

The half-yearly term will commence on Monday, February 20th; and Easter term on Monday, April 24th, 1865. Entrance fee, 5s.

LESSONS DURING EACH TERM.

For the Upper School:—

Pianoforte—Eighteen lessons of half-an-hour, with class lessons in harmony.

Singing—Eighteen lessons of half-an-hour, with instruction on the pianoforte, in harmony, the Italian language, and English declamation.

Composition—Eighteen lessons of half-an-hour, and instruction on the pianoforte and stringed or wind instruments.

Stringed Instruments and Wind Instruments—Eighteen lessons of half-an-hour, and instruction on the pianoforte and harmony.

There will also be Orchestral Practice and Class Singing.

For the Lower School:—

The same amount of instruction will be given as for the Upper School, with the exception of the pianoforte, for which 24 lessons will be given in each term.

REGULATIONS FOR PROFESSIONAL STUDENTS.

All students will be obliged to learn Harmony, and must attend whatever extra classes the Professors may deem essential to their improvement, but no further charge will be made on that account.

Performances will be given, at which the students may be required to assist.

Students will not be allowed to perform in public without the consent of the Council.

No lady or gentleman will be allowed to advertise as having been educated in the College, without the certificated sanction of the Professors.

The year will be divided into three terms, viz.:—Lent Term, commencing early in January and ending at the end of March. Easter Term, commencing in April and

ending early in July. Michaelmas Term, commencing in October and ending before Christmas.

THE AMATEUR CLASSES.

Classes for Amateurs will be held by Messrs. Brindley, Lindsay Sloper, and Ernst Paner, for the Pianoforte; Monsieur Lemmens, for the Harmonium; Mrs. Sims Reeves, Mrs. G. A. Macfarren, Mr. Frank Mori, Signor Pinsuti, Signor Ciabatta, and Signor Mecatti, for Singing. Fee, for twelve lessons of half-an-hour each, £5 5s.

MR. G. A. MACFARREN'S CLASS FOR HARMONY AND COMPOSITION.

Fee for twelve class lessons of one hour each, £5 5s.

Classes for Amateurs will be also formed under the other Professors of the College.

The pupils of these classes will not be allowed to compete for the scholarships, which are intended exclusively for the professional pupils. By Order of the Council.

GEORGE LESLIE, Secretary.

261, Piccadilly.

THE LONDON ACADEMY OF MUSIC.

St. James's Hall, Piccadilly, W.

Principal, Professor Wyld, Mus. Doc.

Masters.—Harmony and Composition—Herr Molique. Pianoforte—Dr. Wyld and Mr. J. F. Barnett. Singing—Signor Garcia, Signor Lablache, and Signor Schira. Singing—Signor Zamboni and Signor Pinzoni. Sight-Reading and Accompaniment—Herr Wilhelm Ganz. Harp—Herr Oberthür and Mr. T. Wright. Violin—Herr Molique and Herr Jans. Violoncello—M. Pague. Organ—Mr. George Cooper. Concertina—Signor Engel. Italian Language—Signor Maggioni.

Other Masters in various branches. A lady superintendent and governess.

This Academy (which is divided into two departments, one for ladies the other for gentlemen) is designed for vocal and instrumental students desirous of receiving a complete musical education in this country, from the best London professors, on the moderate fees of the Continental Institutions.

Students can select either Harmony, Pianoforte, Singing, or any other branch of the Art, as their principal study, and receive individual instruction in that branch from one of the principal professors; or, in addition, receive instruction in two or three branches.

For example:—A student selecting Harmony or Composition as a principal study, is entitled to receive individual instruction from Herr Molique, and Pianoforte and elementary Singing lessons.

A student selecting Pianoforte-playing as a principal study, is entitled to receive individual instruction from Dr. Wyld and Mr. J. F. Barnett, elementary Singing lessons, and Harmony lessons in the Principal's Harmony Class.

A student selecting Italian Singing as a principal study, is entitled to receive individual instruction from Signor Garcia, Signor Lablache, or Signor Schira. Pianoforte lessons from an assistant professor, and Harmony lessons.

TERMS.

The year is divided into three terms, each term consisting of twelve weeks' instruction. A lesson is given once a week in each branch of study. The terms commence on January 12th, April 24th, and October 1st. The Academy is closed for a month's vacation at Christmas, and for two months at the end of the Lent season.

Students residing at a distance can receive all the lessons on one day.

The fee for each student is five guineas per term, which includes the whole course of instruction necessary for a complete musical education. Italian and Elementary are extras. The fee for Italian is, fifteen shillings per

term of twelve weeks; for Elocution, fifteen shillings per term of ten weeks.

All fees are required to be paid in advance.

CANDIDATES FOR ADMISSION AS STUDENTS.

Candidates for admission as students must show that they possess sufficient ability to profit by the course of study, and are required to attend at the Academy before the commencement of the term at which they desire to be admitted, in order to be examined by the principal. The examination days can be known by referring to the advertisements in the *Times*. The examination-fee is five shillings, payable at the office, St. James's Hall, where prospectuses may be obtained.

A. AUSTIN, *Secretary*.

The competition for the scholarships took place in May last, Madame Schuman and Signor Arditi were umpires. Of the pianistes, Miss Fanny Baker and Miss Kate Roberts obtained an equal number of marks; of the vocalists, Miss Pratt obtained the highest number.

THE LONDON VOCAL ACADEMY.

18, Cecil-street, Strand.

Principal, Mr. Frederick Kingsbury.

Professors.—Cultivation of the Voice and Singing.—By the Principal. Pianoforte and Accompaniment.—Walter Bache, Esq. French Language.—Mons. De Fontanier (author of "*La Grammaire Simplifiée*"). Elocution.—C. J. Plumpre, Esq. (Lecturer on Elocution, Oxford and London).

The Academy (divided into two departments, one for ladies and the other for gentlemen) has for its object complete education in all its branches of study necessary to the vocal artist, and is in this respect modelled upon the systems adopted by the Continental *Conservatoires*.

Instruction in the cultivation of the voice, and the formation of a finished style of singing, will be undertaken by the principal, from whom each student will receive separate personal tuition. The collateral studies, such as Pianoforte, Accompaniment, Harmony, Languages and Elocution (each so essential to the attainment of perfect vocalisation) will be undertaken by professors of the highest reputation; and as every branch of musical education other than those that have a direct bearing upon the art of singing is excluded, the attention of the student will not be diverted from the original object, viz., learning to sing.

The year is divided into three terms, of three months each. The first commencing in January, the second in April, and the third in October.

Each student will receive one lesson per week, of both separate instruction and class singing—the classes being limited to three students.

The fee for each student is three guineas for the term, payable in advance.

Examination and entrance-fee 5s.

The other branches of instruction are taught in classes, and are extra, as follows:—

Pianoforte and Harmony, two guineas; French and Italian Languages, fifteen shillings; and Elocution, fifteen shillings (per term).

Students desirous of taking private lessons from any of the professors, are requested to apply to the principal.

CANTOR LECTURES.

"ON SOME OF THE MOST IMPORTANT CHEMICAL DISCOVERIES MADE WITHIN THE LAST TWO YEARS." By DR. F. GRACE CALVERT, F.R.S., F.C.S.

LECTURE VI.

DELIVERED ON TUESDAY, THE 16TH OF MAY, 1865.

Recent Researches on Metals and Alloys.

The importance of the subject which I intend to bring before you this evening is so extensive, that it ought to be the subject of a series of lectures instead of attempting to compress it into one, and, therefore, I shall only

give a *resumé* of some of the discoveries which have been made during the last two years.

You are probably all aware that England occupies the first position among nations as a source of mineral wealth, and to enable you to appreciate the truth of this assertion, allow me to cite a few figures, published by Mr. Robert Hunt, F.R.S., the keeper of mining records at the Royal School of Mines. In 1863 the value of minerals produced was £29,151,976, from which metal of the value of £36,364,327 was extracted. There were produced—

Tin ore	15,170 tons
Copper ore	212,947 "
Lead ore	91,283 "
Silver ore	88 "
Zinc ore	12,941 "
Iron ore	3,500,000 "

Further, it is interesting to compare the results given by Mr. Hunt in 1858 with the above, for we find that the mineral wealth of England has nearly doubled in five years, for in 1858 the value of the metals produced amounted only to £18,105,708. I must not omit to state that, during the last few years, England has also taken the lead in the manufacture of aluminium (Jno. Bell and Co., manufacturers, Newcastle) and magnesium, by Messrs. Mellon and Co., Salford, who have adopted the method proposed by Mr. Sonstadt. As to the four new metals which have been of late discovered, viz., cesium, rubidium, thallium, and indium, they are as yet but scientific curiosities, but as their discovery is due to spectrum analysis, I shall refer to them more especially when treating of the method by means of which the discovery of these metals has been made, an illustration of which I shall be able to give, through the kindness of Mr. Ladd, who will show you the various spectra on the screen at the conclusion of the lecture.

Since I had the pleasure of drawing your attention last year to the then novel application of magnesium to the art of photography, owing to the intense light which that metal produces (for it has been calculated to be equal to $\frac{1}{100}$ th part of that of solar light, and has been seen at a distance of 28 miles at sea, and also to its intense actinic power), Mr. Bultinck has proposed the substitution of this metal for zinc in galvanic batteries, and states that he believes the substitution would prove a very advantageous one to electricians. The employment of this metal will be greatly facilitated by the large works which have been erected for its manufacture at Boston, in America.

Although Mr. Faraday observed many years ago that light was transmitted through thin leaves or sheets of the following metals:—platinum, palladium, rhodium, gold, silver, copper, tin, lead, iron, and aluminium, still we were not prepared for the interesting results that Mr. Quincke has obtained and published in the *Philosophical Magazine* for March, 1864. That gentleman endeavoured to determine directly the velocity with which light travels through metals, and he found, strange to say, that it travels faster through gold and silver than through a vacuum. Further, he adds that he was unable to detect any difference in the components of the light which had previously passed through transparent substances, such as plates of glass. The comparative rapidity of light in passing through metals and a vacuum appears to me to be in favour of the new theory of light, which I took the liberty of expounding to you in my first lecture. Although we could conceive the passage of light through a thin film of metal, still chemists were astonished when Mr. Henry St. Claire Deville, whose name I have had the pleasure of often citing in these lectures, published, conjointly with Mr. Troost, some interesting papers on the porosity of substances under the influence of high temperatures. His experiments enabled him to show that even platinum and wrought iron tubes, the latter one-eighth of an inch thick, are, when carried to a high temperature, permeable to gases. The importance of these results cannot be overrated by

chemists, when the permeability of platinum is considered, as that metal has been employed by them under the conviction that its high density and mode of manufacture destroyed all porosity. As to iron, the knowledge of that fact is most important, especially in the manufacture of coal-gas, where iron retorts are used for distilling the coal. So complete is the permeability of iron at a high temperature, that an iron tube which had been filled with hydrogen gas before the experiment was found to contain only a trace of it at the end of a few hours.

Considering the short space of time which I have at my command, I can only state that you will find in the Royal Society's Transactions (vol. 152, part 1, page 1) a most elaborate paper on "The Influence of Temperature on the Electrical Conducting Power of Metals," and also (vol. 150, part 1, page 85) one on the "Conductibility of Copper." These researches of Dr. Mathiessen deserve the close attention of all electric telegraph engineers.

The study of metals must convince every student that, although science has progressed in a marked manner during the last 50 years, still that there is a great deal more to do than has been done. Although we have known copper, zinc, lead, tin, and iron for many centuries, still hardly a month passes without new properties of these metals being discovered, or facts connected with the improvement of their manufacture or the removal of the impurities they contain. I therefore, deem it my duty to advert to a few papers that have been published recently respecting certain impurities which particular metals contain, which impurities, in some instances, enhance the value of the metal, and in others lower their commercial value. No class of substances teaches the young chemist the difficulties and the labours he must be prepared for, if he wishes to be what is technically termed a good operator, and if he pretends to prepare a pure substance. I would, therefore, advise all young men studying chemistry, carefully to read the labours of J. S. Stas on "The Determination of the Equivalents of Chlorine, Sulphur, Nitrogen, Silver, Potassium, Sodium, and Lead," published in the *Moniteur Scientifique* of 1861 and 1864, where they will notice that Stas has spent months of time to obtain a few ounces of pure silver, lead, &c.

COPPER.—The same may be said of the researches of Mathiessen to obtain pure copper, for his studies above alluded to have enabled him to state that there is no alloy of copper which conducts electricity better than pure copper (page 92 of the above memoir), for he found that the most minute quantities of arsenic, phosphorus, sulphur, selenium, tellurium, and oxygen diminished the conducting power of that metal. Whilst on the impurities of copper, I must not fail to mention some valuable additions which Messrs. Abel and Field have published in the *Journal of the Chemical Society of London*, on the means of determining various impurities which copper contains; thus they found sometimes traces, and sometimes several per cent. of the following impurities in many samples of commercial copper, silver, arsenic, antimony, bismuth, lead, tin, and iron (see Tables, vol. 14, page 302), and Mr. Abel, in a paper inserted in the same journal in 1864, proved that copper contained sulphur, as a general constituent, but only in minute quantities; selenium, as an occasional constituent; and that oxygen was always present and sometimes in considerable proportion; thus, in dry copper he found the quantity of oxide of copper, not as Messrs. Dick and Percy have stated, from 10.21 to 9.84 per cent., but from 8.77 to 4.56 per cent. Mr. Abel gives the following numbers as representing the average proportion of oxygen obtained with a series of samples taken in diverse stages in the manufacture of copper:—

	Oxygen per cent.
"Dry" copper	0.42
Ditto (another specimen).....	0.50
"Half-poled" copper	0.20
"Tough-pitch"	0.03
"Over-poled"	0.03

IRON.—As far as our present day's knowledge extends, no metal is more influenced than iron, either for good or for bad, by the presence in it of a minute quantity of another element; thus a few thousandths of carbon transform it into steel, and a few per cent. of the same element converts it into cast-iron; a few thousandths of sulphur, or a few per cent. of silicon, renders iron "red-short," that is to say, brittle at a red heat, whilst the same quantity (thousandths) of phosphorus makes it "cold-short," or brittle at natural temperature. These facts explain why iron smelters and manufacturers do all in their power to use ores as free as possible from these impurities, or apply all their skill to remove them from the ores or metal when present. I am therefore satisfied that all iron smelters will appreciate the value of the following facts, published by M. Caron in the *Comptes Rendus* of the Academy of Science of 1863, on the influence of manganese when used on the blast furnace to remove silicon from cast iron. The following table shows the relative quantity of manganese and silicon existing in the cast-iron thus produced:—

	Manganese.	Silicon.
No. 1.....	7.93	0.05
" 2.....	6.32	0.08
" 3.....	4.70	0.30
" 4.....	3.81	0.55
" 5.....	2.25	0.76
" 6.....	3.90	0.60 cold blast.
" 7.....	2.10	0.75 hot blast.

This table shows that as the quantity of manganese decreases in the pig iron the quantity of silicon increases; further, that the higher the temperature (all the rest of the operation being conducted in the same manner) the quantity of silicon increases and the manganese decreases.

M. Caron has further made the important remark that it is the interest of the iron-smelter to use as much lime in the blast furnace as practicable when manganeseiferous ores are employed, for not only does lime facilitate the introduction of manganese into the iron, but also helps to a marked degree to remove the excess of silicon.

Eight or nine years ago I made the observation that if manganese had not the property of removing phosphorus from iron, it had the one of hiding or of counteracting the bad influence of that element on iron; in fact I found that cast-iron, containing as much as one or two per cent. of phosphorus, would yield good merchantable iron if the pig iron contained at the same time five or six per cent. of manganese, and I have lately heard that manganeseiferous ores have been used with great advantage by the Cleveland iron smelters to overcome the "red-shortness" of their cast iron, which is due, as is well known, to the presence of phosphorus compounds in the Cleveland iron ore.

It is highly probable that the advantages which have been derived from the employment of "spiegeleisen" iron, in improving the quality of steel produced by Bessemer's process, is owing, not only to the fact that the peculiar iron contains a large quantity of carbon, which yields to the molten iron contained in the Bessemer's process, but that the manganese contained in it, contributes also to hide the influence of the phosphorus or to overcome the detrimental proclivity which a trace of phosphorus would impart to the steel produced by this process. I say hide, because the phosphorus is still present, since that substance cannot be removed from the above process from any pig iron in which it is present.

M. Caron has published in the *Technologie* a paper in which he shows that no amount of oxygen blast will remove phosphorus from any ore which contains it; and that tin-plate manufacturers and those who employ charcoal iron, should pay the greatest attention to the quantity of phosphorus contained in the iron they employ for refining ordinary iron; thus some iron is susceptible of yielding as much as 1 per cent.

us to iron, whilst others only 0·12 per cent., and lastly some only a trace.

If phosphorus, sulphur, and silicium are injurious to the quality of iron, the metal called tungsten, on the contrary, appears to improve in a marked degree its quality, especially when in the state of steel. This fact has not only been demonstrated beyond all doubt by Mr. Mushet, but also recently by some scientific researches due to M. Caron, who has proved that steel containing tungsten, presents greater tenacity, and can be used with great advantage for many purposes; in fact, he thinks that tungsten can be used instead of carbon as a converter of iron into steel. There can be no doubt that the employment of tungsten in connection with the hardening of steel, and other various applications which that metal is susceptible of, will be greatly enhanced if the fact stated in the *Chemical News* of August 25th is brought to bear, viz., that a Swedish chemist has found a simple and practical method of extracting tungsten from its ore so as to reduce its cost of production to a few shillings per pound.

Mr. R. Johnson and myself have published a paper in the *Memoirs of the Royal Society*, in which we showed that the conductivity of iron was greatly modified by the quantity of carbon it contained, as proved by the following table:—

	Found.	Conductibility of silver = 1,000.
Wrought iron	13·92	... 436
Steel	12·65	... 397
Cast iron	11·45	... 359

We also found that the hardening of steel had the greatest influence on its expansibility, for whilst a steel bar, hardened to the maximum, expanded to a degree which may be represented by 84, the same steel rendered as soft as possible, expanded only 62.

Although the oxidation of iron, or its rapid destruction under the influence of the carbonic acid and oxygen of the air, is a source of great advantage to those who manufacture this article, still in many instances it is a source of annoyance to those who possess articles made of that valuable metal, and in others it is a national loss, as in the rapid decay which our iron ships of war undergo. Allow me, therefore, to say a few words on these points.

It is easy to preserve small articles made of iron from rust, either by plunging them into a weak solution of caustic alkali (whether the iron is preserved by a peculiar action of the alkali, or because it prevents the action of the carbonic acid of the atmosphere in conjunction with oxygen and moisture, are points to be determined), or covering them with a varnish made of india-rubber, gutta percha, and a small amount of fatty matter. As to the preservation of ships' bottoms from corrosion, without entering here into the various methods that have been proposed of late to effect this important object, still I deem it my duty to call your attention to one or two methods that have been tried with apparent success; thus Mr. Leach has applied on the iron surface of ships' bottoms a coating of gutta percha or other cement, and fastening by it sheets of glass of about one-fourth of an inch in thickness. The glass is previously bent to the shape of the ship, and pierced for the reception of the screw or bolts, which are preserved from immediate contact with the metal bolts by coating them with a little of the fastening mixture.

Prof. Becquerel relates, in the *Comptes Rendus* of the Academy of Sciences, 1864, the results which obtained by the application of his galvano-electric process on the iron bottoms of some of the French men-of-war. This process is based on the same principles as those adopted

by Humphrey Davy, in 1824, for preventing copper from being rapidly corroded by sea water, and consisted, as you are aware, in attaching at long distances blades of zinc between the wooden sides and the copper sheets, or, what effected the same purpose, in using brass nails for fastening the copper in the sides of the vessel.

us some per cent

M. Becquerel employs zinc in connection with iron, thus establishing a galvanic current which renders the iron like the copper in Sir H. Davy's experiment electro-negative, or possessing the same kind of electricity as oxygen, therefore communicating to it the property of liberating oxygen from any compound instead of absorbing or fixing it. M. Becquerel has proved that the galvanic action of the zinc on the iron exercises its influence on the whole of the iron surface of the ship, but nevertheless that its influence decreases as the square of the distance, and consequently that its action is only sufficiently powerful to preserve iron from corrosion for a limited distance, and consequently the preserving bands of zinc must be placed at short intervals from each other.

Mr. Johnson and myself published, as I hope you will remember, in the *Journal* of the Society two or three years since, two papers bearing upon this same subject, the first paper containing facts exactly identical with those published in 1864 by Becquerel; the second showing the advantage that would be derived by shipbuilders in using galvanized iron plates instead of wrought iron ones for plating our men-of-war, for you are aware that the attack of sea water on iron plates in contact with oak was very great; being 2·880 as compared with galvanized iron, which was only of 0·095, all the circumstances of action being equal in both cases.

But the most important result that Mr. Johnson and I have arrived at on this point, is the demonstration in a paper we have published on "The action of sea-water on certain metals and alloys," that the action of sea-water on lead is nearly nil, as seen by the following table:—

ACTION OF SEA-WATER UPON METALS.

1 Metre.	Grammes.
Steel	29·16
Iron	27·37
Copper (best selected)	12·96
Do. (rough cake)	13·85
Zinc	5·66
Galvanised iron (Johnson's process)	1·12
Block tin	1·45
Stream tin	1·45
Lead (virgin)	trace
Lead (common)	trace

This metal can, therefore, be used with great advantage to preserve the keels of iron ships from being corroded by the action of sea-water, and that the objection which might be raised as to its softness might be easily overcome by adding to lead a few hundredths of either arsenic or antimony, which would increase its hardness, and thus render it better fitted for the purpose referred to. From experiments that we have made we can further state that, in our opinion, Muntz's metal is a far superior article to copper for sheathing ships.—(See *Society of Arts' Journal*, April 21, 1865.)

As a few ladies have done me the honour to attend these lectures, it may be interesting to them to have a simple method of cleaning silver, or silver-plate, without the trouble of employing rouge or other cleaning powder, which, besides rapidly wearing off the metal, takes up much of their servants' time. It consists in plunging for half an hour the silver article into a solution made of 1 gallon of water, 1 lb. hyposulphite of soda, 8 oz. muriate of ammonia, 4 oz. liquid ammonia, and 4 oz. cyanide of potassium; but, as the latter substance is poisonous, it can be dispensed with if necessary; the plate being taken out of the solution, is washed, and rubbed with a wash leather.

Improvements have also been made of late in coating cheap metals, such as iron and brass, with more valuable ones, so as to enhance the value of the fancy articles made with them. If you remember, I referred to a process devised by Mr. Oudry for coating cast-iron with copper or bronze. The method that I wish now to bring before your notice is one devised by Mr. Weil, and is based on the same principle as the one which has been in practice

for some time in tinning iron pins, or covering brass with gold, viz., plunging the article to be coated into a boiling alkaline solution of a salt of tin, or a salt of gold; and, in the case of Mr. Weil, into one of copper, which consists of an organic salt of copper (say the double tartrate of copper and potash) with an excess of alkali, taking care that the cast or wrought iron to be coated is in contact with a brass wire during the operation.

I shall now take the liberty of dwelling for a short time on various memoirs which have been published in connection with the physical properties and chemical composition of alloys.

You will find in the "Transactions of the Royal Society," vol. 150, some extensive researches by Dr. Matthiessen on "The electrical conducting power of alloys;" also in vol. 154, on the influence which heat exercises on that important physical property of alloys. Mr. Johnson and myself have published papers on the density of alloys, as well as on the hardness, expansion, and conductivity of the same. It was admitted some years ago that alloys were simply a mechanical mixture of various metals, but the systematic researches which we have published leave no doubt, that when certain metals, such as tin and copper, bismuth and lead, zinc and copper, are employed in equivalent quantities, and that the proportion of each metal does not exceed two or three equivalents of one, to one equivalent of the other, that they are susceptible of combining and forming definite compounds. I may state, in corroboration of this statement, that if one equivalent of zinc and one equivalent of copper are melted together, or 49·82 of copper and 50·68 of zinc, and well stirred, and allowed to cool until a crust is formed on the surface, and then a hole be made in the crust and the fluid portion poured out, well defined prismatic crystals, sometimes of $\frac{1}{2}$ -inch long, will be found to coat the interior of the solidified mass, whilst if 45 per cent. of copper and 55 per cent. of zinc, that is to say, proportions which are no longer equivalent to each other, then, instead of obtaining a fine golden coloured crystalline alloy, a white amorphous mass will be produced, in fact, no brass founder attempts to use more than 40 per cent. of copper to produce brass, for experience has taught him that if he exceeds that quantity he obtains such a white metal that it is no more a marketable article. Another example is furnished by certain alloys for bronze. Thus, when two equivalents of tin for one equivalent of copper are employed, the conductivity of this alloy for heat is equal to that of both the metals together entering into its composition, whilst if the conductivity of alloys, composed of three equivalents of copper to one equivalent of tin, or four equivalents of copper to one equivalent of tin, is ascertained, it will be found that their conductivity is quite different and independent of that of the metals entering into their composition, in fact the conductivity of four equivalents of copper and one equivalent of tin is five times less than the one first cited.

Without occupying your time with further instances, let me call your attention to an important fact, that Dr. Matthiessen, Mr. Johnson, and myself have observed, viz., that the addition of a small quantity of a metal which may be considered as an impurity, completely modifies, in many instances, its properties, and the most important example that I am acquainted with, is the influence which the addition of one or two per cent. iron exercises on the properties of brass. If a brass be composed of 60 per cent. copper and 40 per cent. zinc, it will be susceptible of being drawn or bent when cold, but cannot be forged or worked when heated, whilst if 1·75 or 2·0 per cent. of iron be substituted for the same quantity of zinc, then a most valuable brass is obtained, for not only is this brass capable of being forged at a red heat like iron, but its tenacity is increased in an enormous proportion, for each square inch of surface is able to support a "breaking weight" of from 27 to 28 tons, a tenacity nearly equal to that of iron.

Messrs. Beyer and Peacock, of Manchester, who experimented with bolts made of this alloy, in the hope of substituting them for iron ones in the fire-box of locomotives, found that these bolts would support strain equal to those of iron, and that the threads of the screw were not stripped with more facility than those of iron when exposed to the same strain.

There is no doubt than when this alloy becomes more generally known many valuable applications of it will be made in the arts and manufactures.

Whilst dwelling on valuable brass alloys let me say that two alloys have lately been introduced which will prove useful to those requiring them, namely, a white alloy, which is chiefly employed for the bearings of the driving wheels of locomotives, owing to its extreme hardness, and which is composed of:—

Zinc.....	77
Tin.....	17
Copper.....	6

100

The other alloy has been lately proposed to the printers by Mr. Lensen as a substitute for the steel blades used by them to remove the excess of colour which adheres to the surface of their printing-rollers, and which blades bear the name of "doctors."

Mr. Lensen's metal is composed of:—

Tin.....	45
Zinc.....	55
Copper.....	55

100

This alloy is stated to have all the flexibility, tenacity and hardness required for the "doctors" used in printing, and, further, it presents the great advantage of not being acted upon by acid liquors, which action is a great source of annoyance to calico-printers.

I shall conclude this lecture by alluding to the extraordinary modification in the fusibility of metals when several are fused together; thus, for example, the following well known alloys which liquify in boiling water—

	Newton's alloy fusible at 212°.	D'Aren's alloy fusible at —
Bismuth.....	5	5
Tin.....	3	3
Lead.....	2	5

Whilst the fusing point of these metals, when separated, is as follows:—

Bismuth.....	513°
Tin.....	451°
Lead.....	620°

Therefore the fusing point of each metal is several times higher than when they are mixed in the above proportions.

A still more fusible alloy has lately been brought before the notice of the public by a Mr. Wood, in the American journals, in which he states that by mixing together

Lead.....	8 parts
Bismuth.....	6
Tin.....	4
Cadmium.....	3

An alloy is obtained whose point of fusion is equal to the degrees, therefore susceptible of being used with great advantage for dental purposes.

I have now to refer to the four metals which have recently been discovered, viz. caesium, from *caesia*, "sky-colour," owing to two blue lines which it produces in the spectrum; rubidium, from *rubida*, "dark-red," owing to the same in its spectrum of two red lines of remarkable brilliancy; thallium, discovered by Mr. William Crookes.

which derives its name from *italica*, "a budding twig," symbolising the beautiful green tint of budding vegetation; indium, discovered by Messrs. Reich and Richter, of Freiberg; all of which are due to the introduction into science of a mode of investigation, known as the "spectrum analysis."

The principle upon which this mode of research is based has been of late so well described and illustrated by Dr. William Allen Miller, in a paper read before the Pharmaceutical Society (see *Society's Journal*, February, 1862), and by Professor Roscoe in four lectures at the Royal Institution, London (see *Chemical News*, vols. 5 and 6), and which lectures have received such a wide publication that I think it useless here to enter into details, and more especially as Mr. Ladd will illustrate, by means of his powerful electric lamp, the spectra of some of the above metals, as well as those of potassium, strontium, barium, &c.

Notes.

FREE SCHOOLS IN PARIS.—In addition to the twenty-eight schools for adults recently mentioned in the *Journal* as having been established in the municipal schools, and which are held in the evening, there exist singing classes in all the communal schools, whether for boys or girls, which amount to 306, so that there is in all 533 classes for gratuitous instruction in singing maintained by the authorities of the city of Paris.

STORM-CHARTS OF FRANCE.—Charts of the storms which passed over the surface of France during the summer of the present year are being prepared in the meteorological department of the Paris observatory, and will shortly be offered to the public at moderate rates, but the number of copies will be limited by the subscriptions made in advance. The publication is in the hands of the Scientific Association, which has its meetings at the observatory.

ARTESIAN WELLS.—The uncertainty which attaches to the boring for water in the chalk basin has been remarkably illustrated in France. Every visitor to Paris, who takes an interest in such matters, knows the Puits de Grenelle, the water of which is seen at the top of a high monument, and has flown, without interruption and with little variation, for several years. Ten or more years ago another artesian well was commenced by the Avenue St. Cloud, now Avenue d'Eylau, near the Bois de Boulogne, and water was obtained two or three years since, but no practical result has yet been achieved, and the boring is still continued. On the other hand, a well was begun only eight months since, at Arcachon, in the Gironde, and at the end of September, when the boring had been carried to the depth of a little more than four hundred feet, the water flowed forth in an abundant and uninterrupted stream, pure and limpid. The diameter of the bore of this last work is twenty-five centimetres, or nearly ten inches English, and the supply is calculated at not less than 500 cubic metres of water per diem. The entire cost of this well is said to have been equal to £720.

Correspondence.

SUBURBAN RAILWAY TRAFFIC.—Sir,—I have read with much interest the letter on suburban railway traffic from Mr. J. R. Smith, which appeared in the *Journal* of the Society of Arts on the 20th ult. The plan for expediting the traffic on these railways, therein brought forward, viz., that of attaching and detaching a carriage at each station from the train while in motion; is one that occurred to me some time ago, but the expense attending the entire reconstruction of the existing rolling stock of the railway companies, which this plan requires, is so great, that it has hitherto prevented me from bring-

ing my plan before the public. However, as Mr. Smith has broached the subject, perhaps you will allow me to explain my views. As Mr. Smith states in his letter, there is no difficulty in detaching a carriage from a train while in motion; this is frequently done at present on some of the principal lines of railway; the real difficulty to be overcome is that of attaching a carriage to the passing train without causing a severe shock to be given to its occupants. To obviate this, Mr. Smith proposes an arrangement of a rope wound round a spring drum, but I confess I do not quite see how this would work, and if it did, it would leave the carriage attached to the train but at a considerable distance behind it. This Mr. Smith foresees, and proposes to haul the carriage up to the train by manual labour or by slackening the speed of the engine. Both of these plans I consider faulty; the first would require more power than could be exerted by one man, and the guard of the carriage would be the only person available for the purpose, unless several men were carried especially for that object, which of course would be very objectionable. The second plan, that of slackening the speed of the engine, is more feasible, but would cause loss of time, and there would be a difficulty in winding up the slack of the rope quickly enough to prevent it getting under the wheels. The plan which I propose is this: The carriage to be attached to the train would be placed in a siding parallel with the main line, but at the station this siding should be raised considerably above the level of the main line, and should fall rapidly in the direction of the junction. When the approaching train was still some short distance from the station, the carriage would be started down the inclined plane, so that when the train overtook it, it would be travelling at a considerable speed, and the shock occasioned by hooking on would be so slight as not to inconvenience the passengers. Of course the rate at which the train should pass the station should be regulated to a certain maximum speed, at which practice would show this attachment could be effected with ease and safety, and therefore it would be easy to calculate the rate of inclination and length of siding which would be required to give the carriage a rate of speed which would correspond nearly with that of the passing train. The mere attaching the carriage to the train could readily be done. I propose to fix on the end of the last break-van of the train a vertical rod, revolving on a pivot with an overhanging arm, which would catch a hook on the top of the carriage to be attached to the train; on the vertical rod I would have a drum with a friction strap and powerful lever, which would be under the control of the guard; this break would keep the arm of the rod at right angles to the van until the siding began to curve towards the main line, when, by gradually decreasing the pressure on the drum, the arm would be drawn into the same direction as the train. But the real difficulty to be overcome is that of taking hold of the carriage without given it a sudden jerk, and this, I think, is overcome by my plan of the inclined plane. It is quite evident, that if the public is to derive the full benefit from our suburban railways, some means must be devised to accelerate the rate of travelling on them; and I venture to think that some similar plan to the one that has occurred to Mr. Smith and myself will have to be adopted. Hoping that some other members of the Society will favour us with their views on this subject.—I am, &c., CHARLES H. BELL.

November 1, 1865.

MEETINGS FOR THE ENSUING WEEK.

Mon. —B. Geographical, 24. 1. Mr. S. W. Baker, "Account of his Discovery of the missed great lake of the Nile, Africa &c."

Tues. —Anthropological, 8.

Zoological, 24.

Civil Engineers, 8. Mr. Charles Tilston Bright, M.P., "The Telegraph to India, and its Extension to Australia and China."

Syn-Egyptian, 24. Mr. W. F. Alcock, "On the Sacred Festivals of Palestine."

WED. ...British Meteorological, 7. 1. Lieut. Beechcroft, I.R.N., "On Extended Series of Meteorological Observations recently adopted in Russia." 2. Mr. John Bloxam, "Temperature at Greenwich and Newport." Society of Arts, 8. Opening Address by Mr. Wm. Hawes, F.G.S., Chairman of Council.

THURS. ...Linnean, 8. Dr. McIntosh, "On British *Salpæ*." 2. Sir John Lubbock, "On *Chloeca*, part 2." 3. Mr. Hailey, "On the *Cynipidae*." 4. Dr. Baird, "Monograph of the *Aphroditæ*, part 2."

Patents.

From Commissioners of Patents Journal, November 3rd.

GRANTS OF PROVINCIAL PROTECTION.

Animal charcoal, treating—2679—E. Beanes.
Ballast, &c., skips for raising—2663—C. H. Murray.
Barrow—2659—R. Stephens.
Basins, sinks, and baths, overflow for—2637—H. H. Craigie.
Baths—2749—W. Clark.
Billiard tables—2696—W. E. Gedge.
Bits, braces for—2736—J. Orrin.
Blind-cord, weaving the covering of—2681—H. E. Newton.
Boiler tubes, forming the mouths of—2697—G. E. Ghiselin.
Boots, &c.—2132—F. Lawrence.
Buttons—2753—G. A. Hoddart.
Caloric or hot air engines—2675—R. A. Brooman.
Cane, splitting and preparing—2717—R. Blesy.
Centrifugal governors—2639—W. E. Newton.
Chemical toys, known as "Pharaoh's serpents"—2694—T. King.
Cocoa-nut, reeds for weaving—2691—T. Catchpole.
Corn, &c., grinding—2583—J. Priestly, W. Whitworth, and J. Sutcliffe.
Cotton, twisting or doubling—2631—J. B. Edge and E. Hird.
Date Indicator—2566—L. R. Whitehead.
Electric telegraph conductors—2733—A. Parkes.
Fabrics and tissues, printing and dyeing—2701—W. Clark.
Fibrous substances, machinery used in spinning, &c.—2713—W. Sumner.
Fish hooks—2673—A. Fenton.
Fire-arms, breech-loading—2645—H. H. Williams.
Gas meters—2549—J. Webster.
Gold, &c., crushing and washing—2643—W. H. G. Jones.
Hoses, blinkers for—2689—C. A. Elliott.
Hurdles—2629—R. Longdon.
Ice houses, skating places, and baths—2292—A. W. Parker.
Iron in a molten state, applying carbonic gas to—2657—J. C. Ridley.
Iron vessels, preserving and keeping clean the bottoms of—2653—W. J. C. Macmillan, J. Mason, and J. V. Scarborough.
Leather satchels, &c., gussets of—2707—F. Thompson.
Meat for food, preparing—2677—A. H. Hassall.
Meat, mincing—2437—J. Donnell.
Metal, shaping—2652—H. Hughes.
Mortising machines—2731—W. Parsons.
Motive power, obtaining—2425—G. B. McNicol.
Paraffine lamps—2616—D. Gallafent.
Pianofortes, &c.—2663—I. Gregory and E. and W. Farr.
Pianofortes, keys for—2747—D. G. and S. Staignt and J. Cheverton.
Plants, domesticating the leaves and flowers of—2703—A. L. McGavin.
Polishing and brushing—2655—J. L. Hancock.
Portfolios, fastening for—2664—J. Orrin and T. Geer.
Postage stamps to letters, apparatus for affixing—2412—H. A. Davis.
Pumps—2745—H. Bateman and E. G. Garrard.
Pumps, double or single action—2622—W. E. Gedge.
Railway switches, points, and signals, working—2669—H. Skinner.
Railway trains, apparatus to facilitate signals being made by passengers in—2755—A. B. Blackburn.
Railway vehicles, axle-box for supplying oil to—2737—W. E. Gedge.
Road carriages and breaks for same—2687—J. Rock.
Roofing, tiles for—2693—J. Taylor.
Ruffles or frills—2679—C. O. Crosby.
Sabots for projectiles—2633—H. H. Williams.
Sewers, trapping and ventilating—2614—R. Abell.

Sewing machine—2532—W. R. Lake.
Sewing machines—2649—G. B. Woodruff.
Sifter—2689—C. H. Cope.
Spring bolts and sleeve links—2685—J. S. A., G. E., & F. F. Radig.
Steam boilers—2641—F. Wise, E. Field, and E. H. Aydes.
Steam boilers, preventing incrustation in—2332—W. Hewitt.
Steam consuming apparatus—2676—F. G. Scardo.
Steam ships, &c., propelling and steering—2543—R. W. Fraser.
Steel and iron wheel tyres, forging—2696—J. Penton.
Submarine electric telegraph cables—2695—F. T. Habert.
Table knives and forks, securing the handles of—2671—T. McNeil.
Textile fabrics, finishing—2647—W. Robertson and J. G. Orchar.
Toothed wheels or pulleys, moulding—2751—G. L. Scott.
Vegetable fibres for spinning, preparing—2725—J. H. Dickson.
Windlasses, method of working—2635—G. and A. Deslandes.
Window blinds and screens—2699—J. Ballard.
Window fittings—2603—W. Cooke.
Windows when cleaning, apparatus to be fitted to—2727—J. W. La.

Photographic News.			
Reader.			
Social Science Review.			

INDEX TO VOLUME XIII.

A.

Abrassins, French trade with, 470
 Academy, French, of inscriptions, &c. numismatic prize, 554
 ———, Royal, award of silver medals, 99
 ———, of Belgium, subjects selected for memoirs, 251
 Acclimatisation in Victoria, 463, 529
 Adams, Mr., *disc.* (boilers), 399
 Adams, W. B., the construction, traction, retardation, &c., of railway trains, 53
 ———, on the mechanical conditions of railway working to prevent destructive wear and risk, 38
 ———, steam boilers, 441
 ———, letter on the preservation of food, 339
 ———, propelling trains, 180
 ———, radial locomotives, spring tires, and wood wheels, 103
 ———, town gardens, 356
 Address, chairman's opening, 2
 Africa, ostrich breeding in, 281
 Agricultural show, Tasmania, 252
 Agriculture in France, 212
 ———, New South Wales, 252
 ———, South Australia, 642
 ———, Victoria, 642
 Ailanthus silk-worm, 112, 696
 ———, timber, 652
 Airy, G. B., lectures on magnetical errors, &c., naval architecture, 253
 Albert medal, award of to Napoleon III., 632
 Ale, preservation of, W. Symons, F.C.S., 321
 Algeria, cotton and wine in, 697
 ———, the vine in, 306
 Allan, Thos., *disc.* (submarine cables), 434
 Alpines for New Zealand, 169
 Aluminium, 541
 Amberley, exhibitions at, 67, 471
 American whale fishery, 426
 Ammoniacal gas as a motor, M. Ch. Tellier, 196
 ———, pneumatic application of, 304
 Amsterdam, international fine art exhibition at, 323
 Anchors and cables, by Thos. M. Gladstone, 469; letter on, 491
 Anderson, notice of the late Prof. N., 563
 Andrews, W. P., *chairman* (railways), 64
 Anglo-French working class exhibition, 462, 465, 610
 Aniline black dye, 381
 ———, dyes, 423
 Animals, killing of, without pain, by carbonic acid gas, 67
 ———, the food of, Professor John Coleman, 241
 Ansted, Professor D. T., Cantor lectures on the applications of geology to the arts and manufactures, 199, 218, 237, 258, 269, 287
 ———, letter on water supply from wells (Cantor lectures), 286
 Apples, gas from refuse of, 612
 Appold, J. G., notice of the late, 677
 Apprentices, home for, Mr. Hartley's, 563
 Aqueduct, great, 700
 Arching, concrete, 688
 Armstrong, Sir Wm. G., C.B., on chain testing machinery, 726
 Arrowroot in New South Wales, 142, 470
 Art convention between France and Nassau, 734
 ———, conventions, 664
 ———, copyright in France, 611

Art, diffusion of, among the people, 302
 ———, encouragement of, in France, 322
 ———, English taste and, 528
 ———, exhibition in Lyons, 63, 369
 ———, galleries and schools of, in Ireland, 126
 ———, education in Paris, 303, 734
 ———, instruction in, 498
 ———, patronage in Mexico, 500
 ———, processes, engraving and other reproductive, by S. T. Davenport, 131
 ———, retrospective, exhibition, 590
 ———, schools and art instruction, minute of the Committee of Council on, 229
 Art-workmanship prizes, 359, 581; catalogue of works received, 117; exhibition of, 67
 ———, works sent in competition for, 37
 ———, letter addressed to City Companies, 146
 ———, letters from F. W. Campin, F. Holliday, and C. G. McKeazle, 161
 ———, meeting of exhibitors and their friends, 119
 ———, prizes awarded, 163
 ———, evening exhibition of, 106
 ———, prizes offered by the Plasterer's Company, 520
 ———, letter from the Salter's Company, 255
 Artesian Wells, 769
 Artisans, public workshops for, 551
 ———, technical training of, account of the Belgian Government institution for, 650
 ———, in France, 673
 ———, letter on the, by T. Twining, 129
 Arts, the Ecole des Beaux, 265, 304
 Ash, Joseph, *disc.* (industrial education), 96
 Asparagus, gigantic, 502
 Asylum for the middle classes, 725
 Atkinson, J. Beavington, *disc.* (natural history), 376
 Atlantic cable, 116
 Auckland, census in, 613
 Australia, cochineal in, 14
 ———, coinage in, 162
 ———, diamonds found in, 82
 ———, immigration, 749
 ———, post office savings bank in, 612
 ———, silk culture in, 111
 ———, the climate of, 564
 ———, South [See "South Australia."] benefit society, Sydney, 368
 ———, companies, 522
 ———, land, re-valuation of, 14
 Austria, musical education in, 545
 ———, trade with, 178
 Aventurine, 747
 Ayton, Robert, on an improved plan of drawing coals, 499

B.

Bachhoffner, Dr., *disc.* (Dublin exhibition) 77, (railway propulsion) 154, (sewage) 207, (fish catching) 262, (food) 317, (submarine cables) 405
 Balance sheet, 619
 Banking in Frankfurt, 59
 Barbadoes, produce shipped, 1864, 306
 Barker, Stuart, *disc.* (sewage), 207
 Barlow, Peter, propelling trains on the metropolitan and other railway lines having frequent stations, 147, 197

Bazley, Thos., M.P., *disc.* (cotton), 278, (colonization) 421
 Beaux arts, Paris school of, 265
 Beetroot sugar, 213, 305, 599
 Belcher, Sir E., *chairman* (fish catching), 259, *disc.* (food), 317
 Belgium, Royal Academy of, subjects selected for memoirs, 251
 Bell, John, on window horticulture, 327, 371, 403
 Beloe, Mr., *disc.* (Paris) 247, (suburban railway) 789
 Bennett, J., Swiss watchmakers, 372
 Bentley, Professor, *chairman* (natural history specimens), 374
 Benzole acid, transformation of naphthaline into, 394
 Bergen, exhibition at, 652
 Berlin Academy, letters from Mendelssohn in reference to the, 607
 ———, gallery, decoration of the, 369
 ———, new laboratory in, for Dr. Hofmann, 50, 709
 Bethell, J., *disc.* (sewage), 209
 Birch, John, letter on labourers' cottages, 438
 Birmingham Working Men's Exhibition at, 652
 Bishop, Mr., *disc.* (fish catching), 262, (cotton) 279, (Hise) 449
 Bismuth, increased price of, 596
 Blaine, D. Robertson, *disc.* (industrial education), 94
 Blasting powder, new, 64
 Block-machinery, Portsmouth, 100
 Blundell, Henry, notice of the late, 283
 Bohemia, musical education in, 647
 Bombay International Exhibition, 490, 516
 Bonaparte monument, the, in Corsica, 500
 Bonheur, Rosa, chevalière of the Legion of Honour, 540
 Bordeaux, exhibition at, 369
 ———, Society of Fine Arts, 697
 Border customs, Victoria, 14
 Bowing, Mr., *disc.* (sewage), 206
 Bowley, R. K., *disc.* (railway propulsion), 154
 Brady, A., *disc.* (Dublin exhibition), 76
 Brager, M. Durand, pictures of meeting of French and English fleets, 629
 Bramwell, J. F., *disc.* (protection of laven-tions), 224
 Brazil, railway in, 84
 Bridge compound, over the Seine, 706
 Bridge, new iron, 501
 Bristol working men's industrial exhibition, 685
 British Association, Bath, Capt. Henderson on naval architecture, 78
 ———, Birmingham address by the President (Professor John Phillips), 659
 ———, arrangements for meeting at Birmingham in 1865, 197
 ———, electrical resistance, standard of, chosen by the committee of the, 251
 ———, meeting of, at Birmingham ham, list of papers read, 610, 669
 ———, India, rubber as an insulator, W. Hooper, 745
 British Guiana, produce shipped, 1864, 306
 ———, Museum, refreshment room in, 50
 Brokers and middle-men, letter on, by John Dillon, 35
 Brome (*Bromus Schrederi*), the cultivation of, 307
 Bronzes, competition in, in Paris, 584
 ———, in France, 629
 Broome, Mr., *disc.* (window gardening), 334

Burgh, N. P., on marine engines, from 185 1 to the present time, 291; letter on, 425
 Burrell, G. R., on the municipal organisation of Paris, 240
 Burnett, Mr., *disc.* (railway propulsion), 153
 Burt, T. S., study of geometry, 17
 Butter, Irish, 553
 Butter-making, 564

C.

Cab indicators, 179
 Cables and anchors, by T. M. Gladstone, 459; letter on, by T. A. Hochussen, 491
 —, submarine, on the art of laying, by Capt. Jasper Selwyn, R.N., 431
 Cabs in Paris, 529
 California silk, 65
 —, wine in, 14
 Calvert, Dr. F. Crace (Cantor Lectures), on some of the most important chemical discoveries made within the last two years, 287, 599, 701, 711, 739, 751, 755, 765
 —, on the action of silicate and carbonate of soda on cotton fibre, 538
 —, and Richard Johnson, on the action of sea water upon certain metals and alloys, 378
 —, *disc.* (food of animals), 349
 "Cameo, the Queen's new, 99
 Campin, F. W., letter on art-workmanship exhibition, 161
 —, on the means employed in taking fish, especially with reference to submarine illumination, 259
 —, *disc.* (protection of inventions), 223
 Canada, proposed exhibition in, 85
 Cancer, relief in, 643
 Candia, sculpture found in, 265
 Canterbury (New Zealand), the census of, 493
 Cantor Lectures, courses of for session 1864-5, 1
 —, W. B. Hawkins on the reproduction of natural forms by art and manufacture (introductory lecture) 19, 70, 87, 146, 165, 183
 —, Professor D. T. Ansted, on the application of geology to the arts and manufactures, 183, 199, 218, 237, 255, 269, 287
 —, Dr. F. Crace Calvert, F.R.S., on the discoveries in chemistry applied to arts and manufactures, 287, 589, 701, 711, 739, 751, 755, 765
 —, water supply (Professor Ansted), letter on, S. C. Homersham, 268; Professor Ansted, 285
 Canvas, photography on, 390
 Carbonic acid gas, animals killed by, without pain, 67
 Caricatures, exhibition of, 516
 Carlisle, the late Earl of, notice of, 65
 Carpets, German, 34
 Carré's ice machine, 719
 Carriages, museum of, in Paris, 215
 Caryatides of Salonica, 251
 Cassell, John, notice of the late, 370
 Ceiling, metallic, 304
 Celtic, relics, 160
 Cereals, artificial fecundation of, 338
 Ceylon, coffee production, 158
 —, tea in, 698
 Chadwick, Edwin, C.B., *chairman* (London Sewage), 184, 202
 Chain testing machines, by Sir William G. Armstrong, C.B., 730
 Chance, the late Robert Lucas, notice of, 324
 Channel, passage across the, 761
 Charles V., inkstand, sale of, in Madrid, 80
 Charrière, Joseph, F. B., notice of the late, 709
 Charts of the French coast, new, 369
 Chaumont, agricultural and industrial exhibition at, 542
 Chemical science in Germany, 709
 Chemistry, organic, in the College of France, 687
 Chemists and druggists bill, report of the committee on, 552
 Chester, Harry, *disc.* (opening meeting), 10
 China grass, 34, 110, 578, 696
 Chinese opium, 676
 —, sugar, 653
 —, tea and silk, 599
 Cholera, copper a cure for, 667

Cholera precautions, 737
 Chorley, Henry F., evidence of, before the Musical Education Committee, 655
 Chubb, Mr., *disc.* (railway propulsion), 154
 Cinchona in Queensland, 553
 City horticulture, 666
 Clark, J., *disc.* (marine engines), 298
 Clark, D. K., letters on wear and tear of steam boilers, 442, 471, 504
 Clarkson, Mr., *disc.* (fire), 172, (protection of inventions), 227
 Claude, Lorrain, statue of, 64, 337
 Clerk, Sir George, Bart., evidence of, before the Musical Education Committee, 633
 Clocks and watches imported, 665
 Coachmakers operative industrial exhibition, 51, 92, 177, 195, 350
 Coal in France, 111
 —, New South Wales, 502
 —, Mexico, 178
 —, New Zealand, 35, 82, 234, 323
 —, mines of the world, the, 528
 —, in the United States, 65
 —, tar, dyes, 212
 —, trade, 212
 —, trade in Europe, 665
 Iron, &c., Prof. Ansted, 269
 Coals, an improved plan of drawing, by Robert Aytoun, 500
 Cobden, the late Richard, M.P., 355; bust of, at Versailles, 747
 Cochineal in Australia, 14
 Coffee, decline in the consumption of, 665
 —, production, Ceylon, 158
 —, trade, 158, 689, 748
 Cognac, monument of Francois I., at, 64
 Colburn, Zerah, C.E., the ginning of cotton, by, 273
 —, the manufacture of encaustic tiles and ceramic ornamentation by machinery, 445
 —, *disc.* (railways), 46, (railway propulsion), 153
 Cole, Henry, C.B., *disc.* (Dublin Exhibition), 77, (Industrial Education) 93, (General Meeting) 534
 Coleman, Professor John, paper on the food of animals, 341
 Cologne international exhibition, 339, 351, 551
 —, steam fire engines at the, 564
 Colonial societies, 402
 Colonies, provision and labour market in the, 600
 Colonisation, its aspects and results, by William Stones, 405, 443, 596, 627, 685
 Commerce, the stagnation of, 402
 Compass, mariner's, suggestion for extending the use of the, by Nell Stewart, 611
 Concretor, Fryer's, 717
 Conference of institutions, fourteenth annual, 505, 520
 —, of the Metropolitan Association for Promoting the Education of Adults, 62
 Conversations, notice of, 505
 Coppersmiths', co-operation of working, in Paris, 50
 Copley medal, award of at Royal Society, 16
 Copper, a cure for cholera, 687
 —, in South Australia, 65
 —, Lake Superior, 424
 —, mines in New South Wales, 142, 666
 —, smelting furnaces, the utilisation of smoke from, 684
 Copyright in Mechanical Music, 565
 Corais, productions of, 542
 —, the Buonaparte monument in, 500
 Cottages, rural, G. H. Walker, 319
 Cottages, Society's Prize, 438
 Cotton, Clarence River, New South Wales, 213
 —, and linen tissues, means of testing mixed, 737
 —, fibre, the action of silicate and carbonate of soda on, by F. Crace Calvert, F.R.S., 538
 —, imports of, 101
 —, in Algeria, 697
 —, in New South Wales, 142
 —, in Queensland, 112, 234, 441, 552, 642, 708
 —, Siam, 505
 —, Senegal, 212
 —, on the ginning of, by Zerah Colburn, C.E., 273
 —, supply, 127, 305, 354, 676, 748, 760
 Council, list of, 535
 Court, the late Joseph, Désiré, notice of, 213

Cox, Mr., *disc.* (fire), 173
 Cranes and hoistmen, substitutes for, in Paris, 85
 Crawford, J., *disc.* (colonisation), 429

D.

Dalton, W. H., *disc.* (fire), 173, (Paris) 20
 —, letter on Mr. Burrell's paper on the municipal organisation of Paris, 24
 Danish industrial exhibition, 403
 Dante, monument to, 469
 —, photograph of, 462
 Davenport, S. T., a short review of the Society's past and present action in the promotion of industrial education, 88
 —, on engraving and other productive art processes, 151
 Davis, Mr., *disc.* (railways), 61, (food) 211
 Davison, Robert, *disc.* (anchors, &c.), 453
 Dehay, the late Auguste Hyacinthe, 353
 Delacroix, Eugene, monument to, 515
 De Mornay, M., *disc.* (fish catching), 253
 De Morny collection, the, 469
 Denmark, paper in, 13
 Dennet, Mr., *disc.* (railways), 44, (fire) 177
 Denton, J. B., *disc.* (sewage), 208, (wider gardening) 334
 Designs and inventions, claims of authors and inventors to protection for, at industrial exhibitions, Thom. Webster, Q.C., 21
 —, original, for public works, 44
 Deveria, Eugene, notice of the late, 153
 Diamonds found in Australia, 52
 Dick, C. M., letter on hot-ir instead of copper instead of iron tubing, 151
 Dillon, John, letter on brokers and middlemen, 36
 Dis, fibre of, 13
 Disks in New South Wales, 470
 Dodge, M., new kind of mirror by, 251
 Doering, F. B., improved level by, 153
 Dog-show in Paris, 103, 284
 Doubs, hydraulic works in the, 463
 Drainage works, cost of French, 555
 Dredging, exhibition of all mill productions as well as mill stones, 251
 —, musical fete at, 646
 Dublin International Exhibition, 1865, *See* "Exhibition"
 Duferin, Lord, *chairman* (Dublin exhibition), 70
 Dyer, Mr., *disc.* (railways), 58
 Dyes, aniline, 423
 —, coal tar, 212

E.

Earthenware trade with the United States, 152
 Education and crime, 441
 —, artistic, in Paris, 540
 —, chemical, in France, 687
 —, commercial, in France, 529
 —, Committee of Council on, *See* from report of, 550; minute of committee on art schools and art instruction, 22; *disc.* of prizes for designs to be executed in mosaics, 233
 —, French rural, 613
 —, industrial, review of the Society's past and present action in the promotion of, by S. T. Davenport, 88
 —, in Russia, 307
 —, South Australia, 725
 —, musical, in Prussia, 727
 —, musical. [*See* "Musical"]
 —, of gardeners, 84
 —, physical, 527
 —, special, in France, 666
 —, technical, in France, 65
 —, female, 614
 Educational revised code, 16
 Eggs, annual importation of, 395
 Egypt, gas in, 103
 Electric bells and fire indicators, J. Sen. 17
 —, communication, adoption of, between passengers and guards on the South-Western Railway, 631
 —, light, fishing by the, 579
 —, telegraphs. [*See* "Telegraph"]
 Electrical resistance, a new method of measuring, applied by Messrs. Siemens, by Messrs. Sabine, and Louis Schwendler, 731
 —, standard of, chosen by the committee of the British Association, 251

Electricity, voltaic, great French prize in, 555
 Electro-plating, discoveries in, 64
 — magnetic locomotive, 115
 Ellis, Mr., remarks on musical education by, 538
 —, extract from *Musical Record*, 563
 Ellis, Mr., notice of lecture by, on the Greenwich system of time signals, 235
 Engineers' drawings, photographic copies of, by W. Willis, 33
 Engines, marine, from 1851 to the present time, by N. P. Burgh, 291; letter by G. P. Renshaw, 425
 —, motor, new gas for, M. Million, 470
 England, climate of, 307
 Engraving and other reproductive art processes, by S. T. Davenport, 131
 Easingh collection, sale of the, 642
 Etching society of Paris, 64
 Etna, the eruption of, 602
 Examination of soldiers, 437, 493
 —, scholastic, 215
 Examinations, list of local boards, 362
 —, local prizes, 626
 —, offer of prizes by the Royal Horticultural Society, 183
 —, papers set in 1865, 536, 548, 581, 575, 587, 594, 598, 637, 645, 668, 681, 728, 744
 —, prizes and certificates awarded to candidates, 1865, 474, 495, 505
 —, programme of, for 1866, 615
 —, report as to progress of classes in the metropolitan district, 195
 —, examiners' remarks, 509
 Exhibition, agricultural and industrial at Chaumont, 642
 —, Amsterdam, 322
 —, Anglo-French working class, 452, 466, 610
 —, Art, in Lyons, 63, 369
 —, at Bergen, 652
 —, at Bombay, 490, 516
 —, at Bordeaux, 369
 —, at Bristol, 685
 —, in Canada, proposed, 85
 —, at Nice, 284
 —, at the Saracen Foundry, Glasgow, 684
 —, (1862) building, demolition of the, 85; jury reports, 445
 —, Bristol working men's industrial, 685
 —, coachmakers' operative industrial, 61, 177, 195, 350
 —, Cologne, 339, 381, 551, 584
 —, cottagers, at Amberley, 67, 471
 —, Danish industrial, 403
 —, dead poultry in Paris, 35, 114
 —, Dublin International, paper on, by Sir Robert Kane, 70.—Notices, 33, 95, 108, 121, 131, 156, 177, 233, 280, 302, 319, 337, 350, 377, 400, 422, 437
 —, Fine Arts, at Bordeaux, 80
 —, fishing tackle, 178, 725
 —, Flindrin, 211, 423
